Childhood and Youth.—At this stage the diet must be transitional from that of infancy to that of adult age. The supply of nutriment need not be so continuous as before, but should be more frequent than for the adult. Up to 14 or 15 years of age the rule should be four meals a day, varied, but nearly equal in nutritive power and in quantity. Three full meals a day are generally sufficient after 14.

Adults.—It is only necessary here to refer to the article on DIET AND DIETETICS (see also VEGETARIANISM) for the food of normal adults; and to such headings as DIETARY (for fixed allowances) or COOKERY. Different staple articles of food are dealt with under their own headings. For animals other than man see the respective articles on them.

FOOD, MINISTRY OF: see WAR CONTROL OF FOOD.

FOOD, PURE (see ADULTERATION). It is only within recent years that the transfer of the manufacture of food from the home to the factory, and the transportation of food for greater and greater distances, have made it necessary for governments to promote systematically and scientifically the purity and truthful labelling of food products. The purity of foods, drugs and other commodities was everywhere adversely affected by the conditions prevailing during the World War. There was a great increase in the practice of adulteration, and a marked falling off in the quality of manufactured foods. The use of substitutes and inferior products in times of shortage is a necessity; the subsequent restoration of higher standards is slow. Borax, formaldehyde and other food preservatives were tolerated to an almost unlimited extent in some European countries during the troubled period attending the War, and the users of these substances, after a few years of unmolested privilege, have been unwilling to give way.

Scientific Developments.—One phase of the movement for pure food was a proposal by the newly organized International Union of Pure and Applied Chemistry to study the practice of conserving foods by chemical means—a subject extensively investigated in the United States between 1904 and 1912. A report upon the laws governing the use of chemical preservatives in foods was presented at the fourth meeting of the International Union of Pure and Applied Chemistry at Cambridge, England, in June 1923 (*Comptes-rendus de la quatrième Conférence Internationale de la Chimie*, p. 133-136). The trend of public and

scientific opinion at the present time is toward the complete elimination of chemical preservatives from foods. In addition to their own injurious action, food preservatives disguise the effects of putrefaction, and their use in many cases has put a premium upon the unsanitary handling of foods. Certain advocates, notably Prof. E. Paterno of the University of Rome, have defended the use of preservatives. It has been asserted that the extensive consumption of meats, preserved by boric acid or formaldehyde, as an exigency of war, produced no injurious effects. The lack of cold-storage facilities, such as are everywhere provided in the United States, has been advanced in many countries as an argument for the use of chemicals in preserving perishable foods. Legislation to exclude completely all foreign chemicals from foods has been held to be inconsistent so long as copper compounds, arsenates and other substances are permitted in agriculture as insecticides, fungicides and disinfectants, since traces of these nearly always occur in the fruits and vegetables so treated. Nevertheless opinion among hygienists, manufacturers and the general public is decidedly adverse to the use of chemical preservatives. It has been suggested that an important factor in the increase of certain diseases is the presence of chemical preservatives and metallic poisons in foods.

British Committee on Preservatives.—In England the Minister of Health appointed on July 7, 1923, a Committee on the Use of Preservatives and Colouring Matters in Food. In accordance with their recommendations the Minister of Health announced on Feb. 17, 1925, a Draft of Rules and Orders that completely excludes from foods boric acid, salicylic acid, formaldehyde, fluorides and all other chemical preservatives except benzoic acid and sulphur dioxide, which are permitted in minimum amounts for preserving a limited number of foods and beverages. According to these regulations a food preservative is defined as:—
... any substance which is capable of inhibiting, retarding or arresting the process of fermentation, acidification, or other decomposition of food or of masking any of the evidences of any such process or of neutralising the acid generated by any such process; but does not include common salt (sodium chloride), saltpetre (sodium or potassium nitrate), sugars, acetic acid or vinegar, alcohol or potable spirits, spices, essential oils or any substance added to food by the process of curing known as smoking.

It was objected that the new rules would operate to the detriment of both the trade and the general public on account of storage difficulties and of the increased price at which it would be necessary to sell food under the changed conditions. The new British Public Health (Preservatives, etc., in Food) Regulations of 1925 came into operation on Jan. 1, 1927, with slight extensions of this date in the case of butter, cream and a few other products.

Standardisation.—A basic requirement in pure food control is the establishment of official standards of purity. The differences of opinion which prevail with regard to what constitutes pure sausage, marmalade, chocolate, catsup, ice-cream and numerous other foods would make the task of the analyst an impossible one unless he had available certain recognized standards which are accepted as just by the trade and by regulatory officials. In Germany, Great Britain and the British dominions much valuable pioneer work has been done by the public analysts toward establishing standards of composition for many articles of food. In the United States a joint committee of nine experts selected equally from the U.S. Bureau of Chemistry, the Association of Official Agricultural Chemists and the Association of Dairy, Food and Drug Officials, by joint conferences with the trade, has established definitions and standards for a large variety of foods.

FOOD CONTROLLER. In the World War, this name was given in Great Britain to the member of the Government who was made responsible for the food supplies of the British people. The first food controller was Viscount Devonport, succeeded in turn by Lord Rhondda and others. In the United States the title was Food Administrator. See WAR CONTROL OF FOOD.

FOOD COUNCIL. In Great Britain, after the winding up of the Ministry of Food in 1921, considerable popular feeling was excited by the continuation of high prices for foodstuffs. This led

to the appointment of a royal commission on food prices, which in its report of April 23, 1925 (Cmd. paper 2390 of that year), recommended that the Government should set up a permanent official body charged with the supervision of food supplies and food prices. Accordingly, on July 27, 1925, the prime minister appointed a "food council" consisting of 12 members, the chairman being Lord Bradbury of Winsford, G.C.B. The members were chosen for their special knowledge of public affairs or of business, or for their acquaintance with some aspect or other of the food problem; the two women were chosen to represent the point of view of the housewife; all the appointments are unpaid. The following is the official definition of the duties and functions of the council:

"To investigate and from time to time report to the President of the Board of Trade on such questions as by reason of complaints from persons interested or otherwise appear to the council to require investigation in the interests of consumers or traders, or are referred to them by the President of the Board of Trade, relating to the supplying or price of articles of food of general consumption and in particular the following: wheat, flour, bread, meat, bacon and ham, milk, butter, cheese, eggs, fish, fruit and vegetables, sugar, tea."

The powers of the food council are very limited; it does not possess any statutory right to demand information to control prices, nor has it any authority to trade in food. Its functions indeed are strictly in accordance with the recommendation of the royal commission, upon whose report it was established; that report took the line that the publicity given to the council's work would mobilise public opinion and exercise a potent influence in persuading food traders to comply with the suggestions of the council. It comes to this, that the council is to work upon public opinion by calling facts and stating opinions and that its expressed views are supposed to influence the minds of traders. To this end the council conducts impartial enquiries into the food question and publicly reports its findings to the president of the Board of Trade.

The council examines the complaints received from the public and, in the light of all information available, decides which food-stuff most urgently requires investigation. Consideration is then given to the statistical position, the recent movements of prices and supplies, and information obtainable from trade journals and other sources. Witnesses from the trade are invited to appear before the council and are questioned, but they cannot be compelled to produce evidence. The results of the enquiries are embodied in reports presented to the Board of Trade, which authorizes their publication.

The council began by an investigation into bread prices, and issued three reports on this subject in 1925. The third report, dated Nov. 14, 1925, contains a table indicating what, in the council's opinion, should be the maximum price for the 4 lb. loaf in relation to the price of flour. The table was issued as a guide to the housewife.

In one case the council's work led to legislation. At the request of the Board of Trade, the council investigated the short weight and measure in the sale of foodstuffs, and its report formed the basis of the Sale of Food (Weights and Measures) Act of 1926. This act imposes penalties upon traders who do not give full weight or measure.

Reports have also been published on wholesale tea prices, retail milk prices in 1926, the Smithfield list of retail meat prices, and fish prices. Similar enquiries were pursued in 1928.

The Food Council's endeavour is to maintain a continuing survey of the principal food trades, to ensure that no substantial rise in food prices occurs without adequate enquiry into its cause, and that reductions in wholesale prices are properly passed on to the consumer. Further, the council acts as a court of enquiry which can be set in motion by any food producer, distributor, or consumer who considers that he is suffering from unfair treatment. Its investigations also enable the council to make constructive suggestions to the food trade.

FOOD POISONING. The term food poisoning as used by public-health workers and bacteriologists does not include the

deliberate addition to food of poisonous substances with criminal intent, nor yet individual idiosyncrasy or sensitisation to certain proteins such as those contained in strawberries, eggs, milk or shellfish. Food idiosyncrasy depends primarily on a peculiar condition of the human body rather than on any dangerous quality in the food itself. The various "deficiency diseases," such as *beriberi*, *scurvy* and perhaps *pellagra* and *goitre* which are due to the lack of some essential element in the diet, are also not usually considered as types of food poisoning.

The manifestations ordinarily grouped as food poisoning at the present time are those due to: (1) the presence of poisonous substances in healthy, untreated plant or animal tissues; (2) the introduction into food by accident, or design, of more or less familiar organic and inorganic poisons; (3) the presence in the food of living pathogenic bacteria or other parasites; (4) the presence in the food of poisonous substances elaborated by the growth of various micro-organisms.

Poisons in Plants and Animals.—Certain normal plant and animal tissues contain substances poisonous to man, and when eaten may cause illness and death; such are poisonous mushrooms and certain fish found in tropical waters. Fatal cases of oxalic poisoning from eating the leaves of the common rhubarb have occurred. Horses and cattle grazing free on the western ranges are frequently poisoned when forage is scanty and they resort to weeds and plants generally left untouched, such as the larkspur, the lupins, the water hemlock, and the death Camas. Poisonous weeds eaten by cattle may indirectly produce poisoning in man. The disease known to the pioneer settlers in parts of the United States as *milk sickness* was early recognized to be connected with the occurrence of *trembles* in milch cows, but its origin long remained obscure. It is now believed that both *trembles* and *milk sickness* were due to a poisonous substance in the white snakeroot (*Eupatorium*) which was eaten by the cows when other pasturage failed.

Mineral Poisons.—Occasionally mineral poisons like arsenic and lead find their way by accident into food in the process of manufacture, as in the famous outbreak of *peripheral neuritis* in several of the Midland counties in England in 1900, involving at least 6,000 persons and causing about 70 deaths (*see ADULTERATION*). More recently the cocoa sold by an English firm contained a small amount of arsenic derived from the potassium carbonate employed in its manufacture. Long-continued action of food on containers may dissolve harmful metals such as lead, copper or tin. Tin poisoning from canned foods, although theoretically possible, is so rare as to have little practical significance, doubtless partly because such tin as is dissolved is largely fixed in an insoluble form by the solid portions of the canned food and eliminated directly from the body. Copper, although not a violent irritant, may have a highly injurious effect when absorbed during many years, as in the constant use of distilled liquors containing copper derived from the copper worm of the condenser; cirrhosis of the liver (*see LIVER*) may be caused in this way. Lead, owing to its well-known cumulative effect on the human body, is an undesirable substance to come in contact with food or drink. As long ago as 1767 the local malady of *Devonshire colic* was shown by Baker to be due to the action of cider on lead vessels. Lead poisoning has also resulted from the frequent use of acid beverages in bottles with lead stoppers. When lead was generally used in glazes and enamels for cooking vessels, recognized poisoning from these sources sometimes occurred; the enamelled ware at present in common use in England and the United States is lead free.

Food Preservatives.—The use of food preservatives constitutes a very difficult and important phase of the problem of the addition of poisonous substances to food. Numerous substances have been added to food intentionally for the purpose of preventing the growth of micro-organisms and consequent spoiling. Some food preservatives once widely used are now known to be poisonous for man as well as antiseptic for microbes, and have been generally discarded or prohibited. Such are formaldehyde and hydrofluoric acid and their derivatives. Regarding some other preservative substances there is great diversity of opinion among those who have given the matter most study. The use of boron

and salicylic acid compounds is generally, but not universally, disapproved. Benzoic acid, sulphurous acid and sulphites are regarded by many hygienists as permissible in certain foods under controlled conditions. The differences of opinion emphasise the insufficiency of our knowledge. Until information commanding the respect of all competent experts is available, it is well to err on the side of caution and minimise the use of preservatives.

The practice of adding poisonous substances to food merely for the sake of altering colour or appearance has nothing to recommend it. At the present time any danger of actual poisoning from colouring matter added to candy, pastries and the like is slight. In most countries the health authorities maintain a list of substances, such as certain coal-tar dyes, which are permitted, and prohibitory regulation is strictly enforced. In the United States no colours and no preservatives in foods are permitted unless they are deemed harmless. (See FOOD, PURE, and ADULTERATION.)

Bacterial Poisoning.—Food may serve as the vehicle for certain kinds of disease-producing bacteria and other parasites. In some instances the bacteria are exclusively of human origin and occur in or upon the food as the result of contact with sewage-contaminated water or through handling by a *carrier* of disease germs, e.g., the contamination of oysters with typhoid bacilli present in polluted water and the contamination of milk by a typhoid carrier on a dairy farm. In other instances the bacteria present in the food are derived from an infection of the food animal. This second class of infections is especially important in any survey of food poisoning since the gastro-intestinal symptoms produced are often sudden and violent; many of the most typical and best known mass outbreaks of food poisoning belong to this group. The nausea, vomiting and diarrhoea that characterize these attacks usually attract attention to some article of food eaten shortly before. An attack of this kind rarely terminates fatally, and the symptoms pass off within 24 to 48 hours, having little after effect. Such symptoms characterize acute toxic poisoning and though cooking may have killed the bacilli themselves it will in many instances have left unaltered the toxins to which they give rise. Often a history of illness in the slaughtered animal can be secured. Some of the most extensive outbreaks of meat poisoning in European countries have been traced to the use of meat from an animal noticed to be ailing and promptly killed by the thrifty peasant as an emergency measure.

The bacteria that cause this typical form of food poisoning belong for the most part to the *Salmonella* group of *paratyphoid* bacilli, organisms closely related biologically to the typhoid bacillus, but distinguishable by laboratory tests. Within this group are several different species (e.g., *B. enteritidis*, *B. aertrycke*, *B. supestifer*) that primarily cause disease in various domestic animals, but secondarily and occasionally give rise to food poisoning in man. Food poisoning from bacilli would probably be much more common than it is if foods were not usually cooked. These bacteria are killed by boiling, and the history of many attacks shows that, while parts of an animal eaten raw or partly cooked have given rise to illness, other portions cooked before being eaten have been quite innocuous. Sausages made from uncooked meat or internal organs (liver sausage, blood sausage, etc.) have been the cause of food poisoning in a disproportionately large number of cases. Unfortunately inspection of the meat before sale may fail to reveal any evidence of infection, so that protection against this form of food poisoning depends chiefly on (a) the selection of healthy animals for slaughter and (b) thorough cooking of all foods of animal origin.

Foods may be also contaminated with the bacilli under discussion by rats and mice. These rodents suffer from natural infections with these bacteria and can become carriers. Rodent contamination must always be reckoned a possibility in investigating outbreaks of this type.

Certain of the higher animal parasites occasionally enter the human body in contaminated food. The small roundworm (*Trichinella*) that causes trichinosis is one of the best known. Thorough cooking is an effective safeguard.

Ergotism.—One of the earliest established instances of poisoning due to the products formed by the growth of micro-organisms

in food substances is the disease of *ergotism* so prevalent in the middle ages. Ergot (*q.v.*) is the poison formed by a fungus that grows on rye; in times of famine the enforced use of rye that would not otherwise have been eaten led to much suffering and many thousands of deaths.

Ptomaines.—It was long believed that many instances of gastro-intestinal disturbance (the typical food poisoning of the layman) were due to the products of various micro-organisms found in partly spoiled or decomposed food. Definite chemical substances—*ptomaines* were incriminated, and the expression *ptomaine poisoning* came for a time to play as large a part in popular self-diagnosis as "influenza" or "the grip." In point of fact ptomaine poisoning, if it occurs at all, must be exceedingly rare. Ptomaines appear in food substances in the later stages only of putrefaction—after about a week. Alleged instances of "ptomaine poisoning" when investigated by modern methods may almost always be traced with greater plausibility to some other form of food poisoning.

The products of bacilli that have grown in food may in some instances be the cause of food poisoning, even when the bacteria themselves have been killed. The determination of this question presents great technical difficulties and has not yet been settled.

Botulism.—The most conspicuous and definite example of poisoning from a microbic product formed in food is *botulism*, a disease which is dealt with at length under that heading. Here it may suffice to note therefore that, although so serious when experienced, botulism is fortunately, of very rare occurrence and, further, can be more or less completely guarded against by the adoption of simple precautionary measures. Foremost among these are steps to ensure cleanliness in all foods subjected to preservative processes and, in the case of heat-preserved foods, to use so far as practicable temperatures high enough to destroy the most resistant spores of the infective germ. The majority of canned foods proved to contain botulism toxin give sensible evidence of spoilage. The botulism toxin, unlike the organism that produces it, is readily destroyed by boiling. The immediate rejection, without tasting, of any food showing signs of spoilage, and the re-cooking of canned foods before serving, constitute a second line of defence. If these precautions are followed, botulism already rare should become practically unknown.

FOOD PRESERVATION. As food material in its natural state only keeps sound and edible for a comparatively short time, its preservation has engaged the attention of mankind from the very earliest times and has been practised from the dawn of civilization. Pastoral man preserved milk in the form of butter or cheese, and grape juice in the form of wine; the hunter soon learned to dry or salt his game or fish. The ever increasing spread of man over different parts of the world, into widely differing climates, and still more the increase in the population of towns and large cities has rendered the development of adequate methods of preservation a matter of vital necessity in the maintenance of the food supply of the world. For many centuries the art of preservation developed but slowly; it was purely empirical, drying, smoking or curing with salt being the principal methods. Rapid advance follows when the underlying cause of a matter is understood: so, when the biological causes of the decomposition of food were realised, appropriate methods were soon developed for dealing with the causative agents.

Very few substances decompose of their own accord; almost

always the changes associated with decomposition are due to the activity of living organisms, usually bacteria, yeasts or moulds. In the case of fruit and other vegetable substances, there may also be the activity of ferments or enzymes. The very fact that a substance is available as food for man pre-supposes that it is decomposable by living agency, either microbes or enzymes. If bacteria are completely excluded foodstuffs will keep indefinitely, so that the problem to be solved is how to destroy all living organisms in the food and prevent their subsequent access. As an alternative we can so reduce the temperature that the activity of the bacteria or of any enzyme present is suspended. Yeasts decompose sugary substances into alcohol and carbon dioxide; some bacteria produce acetic, lactic or other acids; others decompose the nitrogenous constituents of the food, giving rise to various gases which often have offensive smells. Moulds attack the carbohydrates, thereby forming various compounds. All these processes may be going on simultaneously if conditions are favourable. The preliminary infection of the food may arise from the bacteria naturally present therein or from contamination from outside, since the air, water and soil are all normally infested with an almost infinite variety of organisms.

Sterilization by Heat.—Of the various methods of preserving food to be considered, only one—sterilization by heat—aims at the complete destruction of all bacterial life. The others merely reduce the numbers of organisms or produce such conditions that their development or activity is prevented; such methods include refrigeration, drying, salting, smoking, the addition of sugar or pickling with vinegar, salt or nitre, or the addition of a chemical antiseptic or preservative. The efficacy of sterilization by heat was known for centuries before its theory was understood. Cooking renders food temporarily sterile, so by repeated cooking it can be made to keep indefinitely, if adequate means are taken to prevent re-infection. This fact is used by the housewife unwittingly when she covers the potted meat with a layer of hot fat, or the jam with paper soaked in brandy. Few bacteria can long survive a temperature above 80°C (176°F) in the presence of moisture (those which can are termed thermophilic) with the exception of some which form spores needing temperatures as high as 140°C (284°F) for their destruction. Sterilization proceeds more rapidly in an acid medium than in an alkaline one, and the fact is that, except for milk, all natural foods are slightly acid in reaction. In the ordinary operations of cooking the temperature employed is above 100°C (the boiling point of water) so almost all bacteria are killed—but not their spores—with the important reservation that in the case of large masses the central portions may not actually reach 100°C (212°F). If conditions are favourable the surviving spores may develop into the vegetative form, hence it is needful either to repeat the cooking or to keep the food under such conditions that the spores do not develop. The presence or absence of air is an important factor since bacteria and their spores are of two classes, aerobes and anaerobes, which respectively grow in the presence or absence of air; of these the aerobes are much the larger class and among its members are those organisms which are most frequently the cause of spoilage.

The application of these principles to the canning of food dates back to the Napoleonic wars, although at that time they were little known. François Appert, in 1810, was the first to preserve meat; he had but indifferent success. Fish and fruit were preserved by about 1840, and in 1856 Borden patented the first process for the manufacture of condensed milk. Since then the industry has advanced and extended greatly, and is now being placed on a surer and more scientific basis; cruder methods and those involving the use of chemicals suspected of being injurious to health are being replaced by processes beyond the reach of criticism. Of prime importance in the canning of food is the vessel in which it is to be cooked, transported and sold. This must be unaffected by heat, or by contact with the food material in it; it must be light, cheap and strong. Glass is sometimes employed, but the most usual material is tin-plate; this is thin sheet steel which has been cleaned and dipped into molten tin and subsequently rolled so as to leave a very thin layer of tin all over the surface of the iron. It is not quite an ideal substance as, quite

apart from mechanical defects, such as pinholes or an imperfect surface, it is to some extent attacked by all acidic foods so that a tiny quantity of tin is communicated to the food. When this amount is only a fractional quantity, at the most not exceeding a grain or so per lb., it is not considered to be prejudicial to health, but as it may be avoided by the use of lacquered tins these are much to be preferred, especially for the more strongly acid foods such as tomatoes. Glass vessels are mainly used for potted meats, tongues and similar articles. There are two principal types of tin-can, the "hole-and-cap" and the "sanitary," the former is the older, into it the foodstuff is filled, then the lid is put on, leaving a small hole which is filled in with a dab of solder after the processing or sterilization. In the sanitary can the lid is put on in its entirety, before or after the cooking, by means of a special "crimping" machine; a gasket is usually inserted to ensure that the can is air tight. This latter type is now the more common.

The process of sterilization usually consists in heating the tins or pots in trays in a large autoclave or pressure chamber, by means of superheated steam, to a temperature in the neighbourhood of 120°C (248°F), but varying according to the nature of the foodstuff. The time also is variable, though it should be sufficient to ensure that the central parts of the tins reach at least 100°C (212°F); it therefore depends upon the size and distribution of the cans in the oven. After this cooking the tins are allowed to cool slowly in the oven with suitable adjustment of the pressure; it then remains only, if hole-and-cap cans have been used, to close up the holes with a drop of solder. It is interesting to note that the development of the food canning industry has been to a large extent favoured by fortune; it was intended to sterilize the food in the tin but in fact this is rarely accomplished. What does happen is that most of the bacteria are killed and those which survive, and any spores, are under such conditions that they cannot develop owing to the lack of air or suitable conditions of food. Almost all the air has been excluded during the process and the proteins of the food have been so changed as to become unsuitable for the organisms which developed in it before cooking. Of all kinds of canned foods not more than about 20% of the tins are sterile, and in the case of sweetened condensed milk a sterile tin is quite a rarity. (See also PRESERVING AND BOTTLING.)

Refrigeration.—This is really the only method which affords a means of preserving food in its raw state for a reasonably long period; it is therefore the only process which is entirely unexceptionable. Its introduction on a commercial scale has immensely influenced the food supply of the world and has affected all civilized countries. It would be no exaggeration to say that no scientific advance since the advent of railways and steamboats has so greatly altered the economic life of Europe and America. Enormous quantities of food, meat, fish, fruit, butter and vegetables are exported, imported and stored, so that the abundance of supply in one country is made to serve the scarcity of another. The use of cold in this way depends upon a plentiful supply of ice; this is rendered possible and cheap by the ingenuity of the engineer (see article REFRIGERATING), and the use of this method is rapidly extending from the large-scale operations of the importer to the small scale of the household, which has its own ice-chest. The object in refrigeration is not to kill bacteria, since these microscopic forms of life can resist a very low temperature without injury; it is to reduce or to arrest completely their activity. All bacteria are rendered incapable of growth at the freezing point of water, so that at or below this temperature all biological change ceases and the only changes which may go on are physical ones, depending on the evaporation of water and volatile flavouring substances, or certain chemical oxidation changes. Enzymes likewise are rendered inoperative by low temperatures. Refrigeration includes both freezing and chilling, not merely because it involves much lower temperatures but because of its effects on the food itself. On cooling foods, particularly nitrogenous ones such as meat, two kinds of change take place, some reversible some irreversible, so that the food may or may not return to its natural condition when it is allowed to resume a normal temperature. A point of great practical importance also is the rate of cooling, since it is found that if the cells and tissues of food are frozen suffi-

ciently rapidly the changes are usually reversible; therefore, to obtain the best results, both the rate of cooling and the temperature must be regulated according to the nature of the particular foodstuff. The foods most usually preserved by freezing are meat, fish, poultry and butter; eggs present special difficulty and when once frozen do not return satisfactorily; they are therefore usually only chilled.

Two methods are in general use for the freezing of flesh foods, (i.) by cold air and (ii.) by cold brine. The former method is slower and occasions more loss of moisture but, as meat does not dry very rapidly, it is preferable; the air must be carefully filtered and purified to remove bacteria and moulds (which grow at low temperatures) or any contaminating odours. Fish suffers much from desiccation and is best treated by the cold brine process. This latter method has the advantage of being much more rapid, but the disadvantage that it communicates some salt to the tissue of the foodstuffs. The more rapid the freezing, the less the penetration of salt; it is therefore the practice to use the lowest possible temperatures; with ordinary brine this is about -21°C (-6°F). Meat may be frozen by the air method, using a much lower temperature, not only because the time taken for the cooling of thick masses of flesh would otherwise be too long, but also to minimise the "drip." A temperature of -60°C (-76°F) or even -70°C (-94°F) is employed for the freezing, and is followed by storage at -6°C ($+21^{\circ}\text{F}$) or -10°C ($+14^{\circ}\text{F}$) in Europe, or often -20°C (-4°F) in America. Recent research has shown that the freezing of flesh has no detrimental effect on its vitamin content or its nutritive value.

Preservation by Drying.—Desiccation or drying is nature's method of preservation. It will be found that all natural substances which will remain unchanged for long periods of time contain but small amounts of moisture, not exceeding say 10%. For example, cereal seeds of all kinds and nuts will keep almost indefinitely; nature preserves them simply by removing water. The reason for this is that bacteria cannot grow on dry materials, so if any food is desiccated, or the water content reduced below 8% or 10%, it is immune from attack—except for a few innocent types of mould. Meat is not now dried in the more civilized countries, though in the wilder parts of South America and in the Balkans the method is still in use; freezing is preferable. Fish is still cured by drying, with or without salting or smoking. Eggs, milk, fruit and vegetables also are dried in enormous quantities. Different kinds of grapes dried in the sun produce raisins, sultanas and currants; plums, apples, pears, peaches, apricots and other fruits are evaporated by exposure on wooden or galvanized iron trays in a warm atmosphere; when galvanized trays have been used there is not unfrequently contamination by zinc which has been dissolved by the acid in the wet natural fruit. Vegetables such as peas, carrots and onions are widely prepared in the dry state and sold in packets, and will keep almost indefinitely. The flavour and colour of such vegetables is apt to be impaired, a fact which sometimes leads to the addition of artificial colouring matters and chemicals to improve the flavour.

Although the desiccation of meat in the ordinary way is not now practised, mention may be made under this heading of the manufacture of meat extract since the keeping property of this depends largely upon a low water content, usually about 15 or 18%. This process was discovered by Justus von Liebig and von Pettenkofer about a century ago. Lean meat, beef or mutton, is extracted with warm water, the fat is skimmed off and the extract heated to coagulate the albumen, which is then removed; salt is added and the broth is evaporated *in vacuo* to the required degree of dryness. One pound of such extract is obtainable from about 25 lb. of lean meat. Yeast when similarly treated yields an extract almost indistinguishable in taste from beef extract; chemically it is recognisable by the absence of certain specific proteins. A well-known preparation of yeast in this form is in common use and is a valuable source of vitamin B. Closely allied to the desiccation method of preserving is the addition of sugar. Although dilute sugar solutions are peculiarly liable to fermentation and other decomposition, a solution containing less than about 25% or 30% of water does not undergo bacterial change, particularly

in the presence of a small amount of acids such as those from fruit. For this reason jam keeps well; it is only liable to a growth of mould on the surface if this is not adequately protected from such infection. Various sweetmeats, jellies and fruits are preserved in this way.

Salt is one of the oldest preservative substances and is used for the preservation of all kinds of fish or flesh; sometimes saltpetre is added with it to give the meat a bright pink colour. The method of application is simply to sprinkle salt on the layers of meat or fish, or in the case of large joints it may be dissolved in water and forcibly injected into the tissue. Alternatively the flesh is soaked in strong brine. Butter also is often salted, the amount added varying from 1% up to 10%, but with the improvement in refrigerating methods salt butter seems to be losing popular favour. Salt is a poor preservative but a useful accessory in conjunction with drying methods, as it enables a larger percentage of moisture to be safely left in the foodstuff. It suffers from the disadvantage of rendering the food less palatable, though much of it can often be washed out before consumption. Smoking is a practice confined almost entirely to fish and ham; its efficacy depends partly upon the drying which accompanies it and partly upon the bactericidal action of the chemical compounds, such as phenols and aldehydes, in the smoke. Other classes of food are preserved in media which inhibit bacterial growth; a notable instance is pickling in vinegar or in brandy. Vinegar is essentially the product of bacterial life; the vinegar bacillus with the aid of oxygen from the air converts alcohol into acetic acid, but when the strength of the acid reaches about 6% the bacillus can no longer grow and other types of bacilli may be killed. For this reason vinegar, which is essentially a solution of acetic acid, inhibits the growth of bacteria in pickled vegetables or fruits or fish. The preservative qualities of these products are strictly limited and it is necessary to minimise risk of infection by exposure to the air. About 3% of acetic acid is necessary to keep pickled vegetables and in making such it must be borne in mind that the vegetables themselves contain about 80% or 85% of water so that the acid added will slowly be diluted to a corresponding extent by the process of diffusion as the water passes out of, and the acid passes into, the tissue of the fruit. Strong alcohol acts in a similar way, for which reason wines of a sufficient alcoholic strength keep indefinitely if evaporation is prevented, and fruit may be preserved by immersion in spirits, as for example in cherry brandy.

The preservation of eggs is worthy of special mention. Several methods are in common use on a large or small domestic scale. On the large scale, refrigeration is generally employed. Millions of eggs arrive in Europe from South Africa and other parts after a voyage of a month or six weeks in perfectly good condition by reason of storage in a cold chamber at or just above the freezing point of water. There is a critical temperature for eggs at about -6°C ($+21^{\circ}\text{F}$); if in the chilling or storage the temperature falls below this point a non-reversible change takes place in the white or albumen, so that the egg cannot be restored to its normal transparent condition. Egg is sometimes preserved in the frozen state for manufacturing purposes, in which case it is cooled to a temperature approximating to -20°C (-4°F), and becomes a solid mass which takes a considerable time to thaw and which, though fluid, never returns to its normal state. On a domestic scale eggs are usually preserved by the simple expedient of preventing the access of air through the shells. Scores of devices for effecting this have been patented; common methods include immersion in water-glass, or in bran or sawdust, coating with vaseline, or even wrapping in oiled paper. When eggs are immersed in sodium silicate solution (water-glass) or milk of lime the shell becomes impregnated with the silicate or lime and is then impervious to the atmosphere. One minor defect in this very good method of preservation is that the eggs have a tendency to burst when boiled—this may be overcome by first pricking the shell with a needle. Also the yolk is apt to burst easily; this is because, when the egg is preserved, water tends to pass from the white to the yolk (which has normally a less percentage of water) and to distend the membrane surrounding the yolk:

Chemical Preservatives.—A very large number of chemical substances, having real or supposed preservative properties, have at different times been added to foodstuffs; many of these are discussed in the article on ADULTERATION. Some are considered harmless and even necessary in certain articles and are permitted to be added in most countries. Nevertheless it is generally agreed that chemical preservatives are not desirable and should be excluded wherever possible; they are as a class self-condemned, for it is obvious that if a chemical inhibits bacterial or enzyme action it must, at least to a small extent, retard digestion and assimilation. The compounds, other than positively objectionable or toxic ones, best known as preservatives include boric acid and borax, sulphurous acid and its salts, salicylic acid and benzoic acid, and formaldehyde or formalin. The last-named substance is now recognized as being injurious and is not tolerated in most civilized states. Perhaps the most used compound is boric acid; at one time all margarine contained it, as did a large percentage of butters, and often cream, bacon and ham. Its use became the more general as the public palate turned against salted foods, and for years it held almost universal sway, as about one-half per cent of boric acid serves to keep most foods sweet for a reasonable period. Salicylic acid and its salts found favour in saccharine beverages, wines and preserves, as it is particularly useful in preventing the growth of moulds. Benzoic acid is in nature similar to salicylic and serves a similar purpose but has the advantage of being less active pharmacologically. Sulphurous acid, or sulphites, are specially useful in light wines where the alcoholic strength is insufficient to preserve them, and in beer and cider; it is also used as an adjunct in the drying of fruits such as sultanas, currants, apples, apricots, etc.

Nearly all civilized countries have now legislated on the question of preservatives in food; all agree in prohibiting formalin and fluorides and any other substance of such definitely toxic properties. Boric acid is tolerated in certain dairy products in Australia, New Zealand, Canada and Holland, but is prohibited in England, the United States and Sweden. Salicylic acid is very rarely permitted, and then only in very small declared amounts in certain countries; it is prohibited in Britain and America. Sulphurous acid is permitted in certain commodities in England up to small stated quantities; it is prohibited generally in meat-stuffs but sometimes permitted in sausages and in wines, beer and dried fruits. Benzoic acid is allowed in stated proportions in certain foods in England, Australia and Denmark and is generally permitted in small amounts in the United States Federal Law. Japan and a few states in the United States are quite intolerant of any preservative of any kind in any food. There can be no doubt that such a veto is the ideal to be aimed at, but its realization in many countries awaits the better development of refrigeration and other methods of food preservation. See also CANNING, REFRIGERATION and ICE MANUFACTURE.

Savage, *Canned Foods in relation to Health* (Camb. Univ. Press, 1923). Much information as to methods of drying and storing is also contained in the Reports of the Food Investigation Board published yearly by H.M. Stationery Office and in the Report of the Committee of the Departmental Committee on Preservatives in Food. (H. E. C.)

Concentrated Milks are among the most important preserved foods and are extensively used. Some 720,000,000 lb. entered international trade in 1925, according to the U.S. Department of Commerce. Of a total world production of about 3,000,000,000 lb., approximately 60 per cent is manufactured in the United States, where 346,368,000 lb. of condensed milk, 1,509,354,000 lb. of evaporated milk, and 186,393,000 lb. of dried milk were produced in 1927. Condensed milk denotes milk from which a considerable portion of the water has been removed, and to which sugar has been added. Milk is rapidly heated to effect destruction of bacterial life; sucrose is added; and the milk is condensed in a vacuum until $2\frac{1}{2}$ parts of whole milk are reduced to one part of sweetened condensed. It is cooled and placed, usually, in small tin containers, although also distributed in bulk. Condensed skim milk is likewise manufactured. Evaporated milk, or

unsweetened condensed, is somewhat similarly made, but without sugar. Milk is forewarmed, condensed under vacuum, and before cooling, homogenized. It is canned and then heated for a sufficient period to cause complete sterility.

Dried or powdered milk was first made by Grimwade in England in 1855, but has been prepared commercially by several methods. In the spray process pre-condensed pasteurized milk, under high pressure passes through fine nozzles into a steel chamber at 270° F. The water evaporates and the resulting powder is removed from the bottom of the chamber. In the roller process for drying milk pre-condensed milk is poured upon hot steel-drums or cylinders. More *dried skim milk* is manufactured than is *dried whole milk*. Malted milk, marketed since 1887, is a powdered product made from whole milk, whole wheat, and barley malt. Evaporated milk is a sterile product, while condensed and dried milk are generally low in bacteria, although not sterile. The sucrose in condensed milk inhibits or destroys the growth of bacteria and molds. Pathogenic bacteria which might be present in the whole milk are destroyed by the various manufacturing processes. Except for vitamin C, heating for concentration does not appreciably affect the vitamins of the whole milk. Vitamin C is not present in evaporated milk and is *apparently* somewhat reduced in condensed and dried, though there is evidence that spray process dried milk retains most of its content of this vitamin. Other nutritive qualities are not appreciably affected. The canned concentrated milks are stable and will keep for considerable periods of time, especially as methods of packing have become more efficient. (J. A. To.)

FOOD SERVICE, the preparation and serving of food to large numbers of people over a continuous period, usually through a chain or a group organization with highly standardized methods. Such quantity food service, since the World War, has been a factor of great importance in effecting changes in the restaurant business. This article is intended to complement the articles in this volume describing the mass production and marketing of food supplies and deals with food distribution and consumption in mass. For a study of restaurants of the typical English, continental or early American type see RESTAURANTS.

Food service has undergone the most significant change in the United States where "mass feeding" has more than doubled since 1918. This branch of the food business sells about 15% of all meals served to the literate, white population of the United States. A recent survey shows one restaurant for each 750 persons residing in American cities. In New York, Chicago and San Francisco from 25% to 35% of meals served are eaten in hotels and restaurants. Population considered, this percentage is greater than that in any other nation. Switzerland ranks second, closely followed by Canada, England, Sweden, Denmark, France, Germany, Italy and Spain. Switzerland leads in food service in schools and hospitals. There are also in Switzerland several excellent hotel and restaurant schools.

In the order of their importance the three main divisions of the food-serving industry are (1) large commercial establishments, (2) non-commercial or semi-commercial groups and (3) small commercial operatives.

The commercial branch of food service business in the United States is made up of about 90,000 restaurants, 25,000 of which serve more than 500 meals a day each, and 20,000 hotels equipped for food sales, about 8,500 of which serve more than 500 meals a day each. The groups serve a total of about 53,500,000 meals daily. Owing to the fact that the terms "hotel" or "restaurant" do not in all countries always mean complete food service, it is impossible to make an accurate comparison of food service in the United States and the rest of the world. It is estimated that outside of the United States there are approximately 500,000 food service units. These include hotels, restaurants, pensions, schools, hospitals, railway diners and steamships. The growth in food service has been constant ever since the close of the World War. Tourists have materially increased the number of hotels and restaurants in Europe, Asia, South America and parts of North and South Africa, and steamships and railroads food service facilities have been greatly expanded. In Europe and parts of Asia, the

trend toward urban life has brought about an increase in commercial food service units. Institutional food service subjects are being taught in colleges in most important countries of the world.

The non-commercial or semi-commercial branches of food serving so termed because they sell food to the public or because they do not compete with other establishments, constitute all kinds of social, charitable, or non-profit institutions, dining cars, steamships, construction camps, circuses, army and navy headquarters. This miscellany totals at least 50,000 units in the United States. Small commercial establishments include boarding houses, street lunch carts and road-side stands. Estimating conservatively, there are 150,000 such food outlets. Thus there is a total of about 310,000 places in the United States serving food to persons outside their homes. The world total is approximately 800,000.

Numerous factors have influenced the trend from individual to group food service. Some of these factors have been women in business, smaller families, shortage of servants, the general public's increased earning power, demand for more leisure, transport problems, automobiles, shorter working hours, the popularity of small apartments, improved catering facilities and in the United States, prohibition. Before the World War, both factory and office employees carried home-made lunches. In 1928 this was rarely done. As a result thousands of restaurants serve only the mid-day meal, five days a week, merely to fill this need. The unusually large turnover from 11 A.M. to 2 P.M. makes this profitable. A very large percentage of modern schools and colleges have food-serving facilities. The number of resort hotels, camps, clubs and road-side stands has materially increased due to greatly increased automobile travel, shorter business weeks and educational work to promote outdoor life. Automobile travel in 1929 was so general that in America many commercial hotels claim that 75% of guests use motor cars. Naturally the number of inns, wayside tea rooms and road-side stands has increased. Most of these changes occurred between 1922 and 1927, and the men and women concerned in the business anticipated the development. Colleges added courses on quantity cooking dietetics, hotel, restaurant and institutional management. Next came books and magazines on the same problems. The chain or group grew until there were about 800 restaurant and hotel chains in the United States. (See HOTELS.)

Simultaneously the character of the food served underwent considerable change. About 60% of the patrons of these group establishments in the United States are women—who are light eaters. Even many American men eat relatively little heavy foods. Therefore, with this consideration and the institution of prohibition, most old-fashioned steak and chop houses have closed their doors. There are sandwich, coffee shops, soda fountains and tea rooms instead. The following table, compiled after interviewing the managers of about 2,000 hotel and restaurant establishments in the United States, indicates this tendency. This covers changes since 1917:—

Decrease.—Meat, for main dishes, 45%; pastry, 26%; white bread (table service), 29%; coffee, 12%; potatoes, 15%; tea, 7%; soup, 5%.

Increase.—Sandwiches, 215%; salads, 110%; ice cream, 70%; milk (malted), 63%; milk (whole), 62%; ginger ale, 47%; fruit (fresh), 39%; whole wheat (bread, rolls, etc.), 35%; vegetables (fresh), 35%; vegetables (canned), 30%; fruit (canned), 33%; fruit (dried), 12%; cereals (breakfast), 34%; cheese, 40%; fish, 33%; grape juice, 32%; gelatine desserts, 26%; poultry, 25%; spring water, 20%; coffee substitutes, 15%; eggs, 11%; pie, 5%.

The tremendous increase in the restaurant and hotel business created a demand for labour-saving machines. This need was met and machines now prepare and sell more food at less cost, considering comparative prices of raw materials than was possible under pre-World War conditions. Seven kitchen and eight dining room workers can serve 185 persons thrice daily by the aid of machinery. A recent study by *Kitchen Management*, gives 40 labour savers used in most quantity kitchens. The figure after each group is the minimum of meals per day that must be served to justify the machines' expenses: dish-washer, food-mixer, butter-cutter, can-opener, scales, mop wringer, sink pumps, automatic

refrigerator, meat grinder, coffee mill, automatic toaster, knife-cleaner, knife-sharpener, urns, mopping trucks, 25 meals per day; vegetable-slicer, fruit-juice extractor, French-fry cutter, pressure-cookers, 50; spice mill, egg-timer, potato-peeler, time clock, potato masher, bread-slicer, food chopper, cream-dispenser, soap-feeder, incinerator, steam kettles, steam tables, 100; meat slicer, silver washer, water-softener, fruit-corer, potato-cutter, electric ice-cream freezer, ice-cream machine, food or dish conveyor, ice cuber, apple-peeler, cherry-stoner, bread-crusher, cheese-grater, trucks, cake-filler, ice-breaker, paper baler, 200; dough dividers, 500.

Great Britain is using labour-saving equipment for food service in greater quantities each year and Germany, France and Switzerland are also adopting these devices. However, the greatest progress made in this regard thus far is in America.

Chain organizations in the United States prepare much of the food in a central commissary and transport it in trucks containing heated containers. Individual units seldom prepare more than coffee and salads on the premises. Generally the ingredients come mixed, ready to be assembled and served. Many chain organizations prepare and wrap sandwiches for resale by drug stores, soda fountains and street carts. Most hotels and the better restaurants however cook and bake the food they serve with the exception of bread and ice cream. Most kitchens use gas, but the use of electricity has increased greatly since 1923. Specialty cooking equipment, such as electric automatic toasters, waffle irons, bacon fryers, steak grills and egg cookers, sells readily and is widely used. In larger hotels and restaurants steam cooking is general. A dozen 30 gal. steam kettles in one kitchen is not unusual. The quantity kitchens of 1928 are factories where the assembling, the preparing and the serving of food is accomplished within a few hours. Steam tables, electrically heated carts and boxes, keep food well conditioned until ready to be served as far as 20 m. away.

In Great Britain chain restaurant organizations are superior to those in the United States or any other country in the world. They are expensively furnished, fully equipped with the latest machines and staffed with highly trained personnel. France, Germany and Switzerland have a limited number of chain hotel and restaurant companies but they do not compare in size with those of the United States. The European hotel chains are often associations, such as the "Uniti." Members agree to assist each other in advertising and financing, and, at times, have a plan for the exchange of employees.

Manufacturing plants, supplying equipment to the food service industry, sell their products direct to users or, more generally, through kitchen supply houses or equipment jobbers. A number of architects and engineers are engaged in planning kitchen equipment.

The adoption of large kitchens has necessitated an extensive study of food and preparation costs. Specialists are employed to plan the most efficient and economical service. Many people are required to purchase, store, prepare, control and serve food. Some design and construct buildings, manufacture equipment, sell, install, collect and serve it; other groups write advertisements, books and magazines. Finally, there are schools and colleges teaching quantity cooking, hotel, restaurant, soda fountain and kitchen management, institutional dietetics, kitchen management. No accurate figures are available but it is estimated that in the United States alone 2,000,000 people devote their entire time to the quantity food service business, including only those actually engaged in the manufacture and sale of equipment and supplies, the building and furnishing of quantity kitchens and food service departments. At least 5,000,000 people are engaged in food service units in other parts of the world. This number does not include hundreds of thousands raising food products served from quantity kitchens, for those canning, packing or transporting such food products. Mass food preparation and service in the United States is growing five times faster than the rate of population increase. In America it is one of the leading businesses and it bids fair to rank second only to agriculture. In other civilized countries of the world it is growing steadily in importance. (See also RESTAURANT; CAFÉ AND CAFETERIA.) (J. O. D.)

FOODSTUFFS, a term applied to the products used for human food, as distinguished from "feeding stuffs" (*q.v.*), the term applied to products used for the food of animals in domestic cultivation. For foodstuffs generally see the articles CEREALS, GRAIN, MEAT, DAIRY, OILS AND FATS, etc., and for specific information the articles under the various product headings, as BEEF, MUTTON, SUGAR, TEA, etc., as well as the articles FOOD and FOOD PRESERVATION; NUTRITION; DIET AND DIETETICS.

FOOD SUPPLY OF THE WORLD. The population of the world is believed to be about 1,800,000,000. The land area (excluding the Arctic regions) is roughly 33,000,000,000 ac., less than half of which is now regarded as arable. Taking good and bad land together, it may be estimated that five acres are required, directly and indirectly, to sustain one human being. Other things being equal, this would fix the limit of population of the globe at something like 6,000,000,000. The direct requirement of acreage per head of population will be reduced by improvements in agriculture and diminution in the number of domesticated animals. Nevertheless, one may regard a population of 6,000,000,000 as the point of saturation for the globe. But from this it is not to be inferred that such a population will ever be reached.

The Law of Diminishing Returns.—Considering the relation of food resources to population, we face the so-called law of diminishing returns. This proposition (it cannot be called a law, logically or scientifically) came into prominence over a century ago and is commonly associated with the names of Ricardo and Malthus. Revised by John Stuart Mill, the modern formulation is stated by Alfred Marshall, as follows: "Whatever may be the future development of the arts of agriculture, a continued increase in the application of capital and labour to land must ultimately result in a diminution of the extra produce which can be obtained by a given extra amount of capital and labour."

The law of diminishing returns proves too much when stated without qualification; when properly qualified it proves little. Of course, some lands are richer and easier to cultivate than others. The proposition can be applied either to extensive agriculture or to intensive agriculture and for both one may agree that *ultimately* the moment will come when the increment of extra produce will fall relatively below the extra amount of capital and labour involved. If the hypothesis of diminishing returns be strictly defined as related to "secular diminishing returns," as has recently been done by Patton, the proposition becomes at once clarified and qualified.

Historically considered, the proponents of the hypothesis of diminishing returns have over-emphasized the proposition, while underestimating the developments in agricultural practice. Up to the present, the agriculture of the world seems to have exhibited secular increasing returns. Statistical data are not complete enough to justify categorical statements, but the evidence lends support to the view that, considered by and large, the agriculture of the world has shown increasing rather than diminishing secular returns. How far this may continue is another question; but the non-fulfilment of inferences drawn from Ricardo and Malthus have transferred the problem from the domain of speculation to demonstration. Patton has remarked that: "Secular diminishing returns can be said to occur if the number of hours required to produce a given quantity of food-stuffs shows a tendency to increase, or if a growing proportion of the world's labour supply is necessary to produce enough food to avert starvation." Such secular diminishing return has not been statistically demonstrated, and until this ultimate result has arrived, the import of the abstract notion is not clear.

Developments in Agriculture.—There seems to be a widespread impression that the art and science of manufacture are relatively more advanced than those of agriculture and that during the last century urban industry has out-distanced rural industry. This is doubtful. Certainly for the United States it seems fair to conclude that farm out-put per man has advanced as rapidly as factory out-put per man. Improvements in agriculture apply both to extensive and intensive agriculture and in particular are important in the adaptation of machine cultivation to terrains that up to the present have been cultivable only by primitive methods. Agri-

cultural technique is very unevenly distributed over the world. In general, highly industrialized countries have well-developed agriculture, industrially backward countries have undeveloped agriculture. The agriculture of India and China, for example, is primitive and inefficient; but the future improvement of China and India depends more on industrialization than on advances in agriculture. The advance in production per head of farming population over the past half century has been facilitated by cheap money, growing familiarity with foreign investments, perfection of world-wide systems of credit and exchanges and developments in transport and refrigeration. Researches and inventions are gradually making agricultural operations feasible in regions where they have been impracticable. Through plant breeding and selection of seed, the cereal belts are being gradually pushed towards the poles. This is strikingly illustrated in Canada and will hold for Russia, Siberia and Manchuria when the agriculture of those regions becomes skilful. When the period required for maturing wheat is reduced 20 days, this will permit substantial extension of the wheat belt towards the poles. Plants are being made more resistant to extremes of heat and cold, drought and moisture, and are being adapted to less favourable soils. Through the physical and chemical study of soils, notable progress is being made in the recovery of barren land. When such advances are technically appraised from the standpoint of experimental botany, it becomes clear that the possibilities are not approaching exhaustion; on the contrary, the technically practicable improvements have scarcely more than begun.

In two directions in particular, improvements still to be accomplished will result in wide extension of agricultural operations throughout the world. Predatory animals, insects and parasitic diseases have inflicted enormous losses, so onerous indeed as to operate heavily in restraint of agriculture, both intensively and extensively. Some of the enemies of the agriculturist tend to retreat with advancing population; but others, in particular certain diseases of plants, are favoured by increasing concentration of cultivated units. The problem is both direct and indirect: direct as involving the plants and animals that represent the crops of agriculture, indirect as involving human beings, for whose occupancy, disease-infested regions must be made safe. It seems now established that if infectious diseases are eliminated, all parts of the tropics are fitted for habitation and agriculture. The effects of tropical isolation have apparently been much exaggerated. If the world could be made free of infectious diseases involving human beings (in particular those transmitted by insects, among them sleeping sickness, yellow fever, typhus and malaria), the world scope of agriculture would be greatly extended. If, thereafter, predatory animals, insects and infectious diseases destructive to domesticated animals, forests, orchards and plants could be reduced to a minimum, or exterminated, the result would be an enormous increase of output with lowering of cost. Notable advances have been achieved in the prevention and control of infectious diseases of animals. Less has been achieved in the prevention and control of infectious diseases of plants; and it is not too much to say that herein lies one of the major future problems of agriculture. These improvements are entirely practicable, technically and socially. If one will compare the sanitation of civilized communities with the sanitation of backward countries, and apply a corresponding advance to the control of predatory animals, insects and infectious diseases afflicting animals and plants, one secures a measure of the possibility of future improvements.

The potential of the agricultural resources of the world cannot be regarded as even relatively attainable until full application is made of the principle of the division of labour. This implies fluidity of transport, both within countries and between countries, also fluidity of credit and convertibility of exchanges. Quarantines must cease to set up barriers to international trade. These several conditions are not yet attained for any one continent, and their attainment for the world at large will presumably be delayed beyond the lifetime of the present generation. Fertilizers represent a substantial, if indirect, agricultural resource, since the indispensable elements must be returned to the soil if depletion is to be

controlled. Valuable as are the natural manures, they fall short of the minimum requirements. Recent improvements in manufacturing technique have greatly enlarged the supply of chemical fertilizers. With cheapening of fixation of atmospheric nitrogen, improvements in recovery of low-grade natural saltpetre, and continuing development of recovery of ammoniacal by-products, the supply of nitrogenous fertilizers may be expected to expand greatly and the price to decline. The available and developed deposits of phosphate rock promise also relatively unlimited supplies of soluble phosphate, presumably on a declining price level. The same thing may be said of potash, of which the out-turn from developed deposits in different parts of the world is being restrained in order to maintain price. In addition, fixation of atmospheric nitrogen through the action of micro-organisms in the soil is becoming better understood and more effectively applied. Corresponding actions by micro-organisms, whereby insoluble phosphate and potash are converted into soluble forms in the soil, seem also to exist, and in view of what has been accomplished with nitrogen it does not seem utopian to look forward to practical developments in these directions. In the gradual transfer of agriculture from the extensive to the intensive basis, the use of fertilizers may be expected to become continuously more important.

Soil erosion is an important and difficult problem in many parts of the world. It has different causes in different regions, such as slashing of forests, destruction of brush cover, over-grazing, artificial drainage and misdirected tillage. Soil erosion tends to be progressive and the area denuded is added to annually. Loss of surface soil, loss of water and alteration of terrain are all of importance. Soil erosion, like reforestation, becomes a public problem because there is little incentive for private capital to enter upon long-time corrective measures.

It is an anomalous situation that the world is just now concerned with the economic problem of surplus of agricultural products and at the same time constrained to fear that the pressure of population on resources may soon lower the level of subsistence. In truth, however, the anomaly consists not in the questions themselves, technically considered, but in lack of perspective of the time relations. The present surplus problem, which in one way or another is practically world-wide, is not an emergency, but is still to be regarded as a relatively short-time situation. On the other hand, a forecast of significant pressure of food supply on population lies far in the future, even in the view of neo-Malthusians.

In judging of the agricultural potential of the globe, we must bear in mind that land has other uses than raising primary food-stuffs and supporting domesticated animals. Land must also be used for producing trees and fibres—industrial raw materials. The world requirements of building timber, fuel wood, paper pulp, rubber, cotton, linen, jute, hemp, sisal, naval stores, gums and other raw materials, are large and for the most part expanding. Since the growth of forests is rarely at the rate of over 3% per annum, in terms of material, the current rate of depletion of forests would seem to imply that in the not distant future, land in many countries will need to be formally withdrawn from agriculture for reforestation under State control. There are many substitutes for wood for building, but while the relative demand may decline through substitution with other materials, the absolute requirements, with growth of population and improvement in standards, may exceed the prospective rate of growth of the established stands of timber. The per caput use of rubber is steadily expanding. The per caput use of fibres for clothing is apparently growing slowly, if at all, while its use, outside of clothing, is obviously expanding. One must expect the time to arrive in the near future when in many countries it will be more profitable to raise industrial raw materials over certain areas than to raise food crops, feed crops, or animals. One must not construe the expanding world requirements of industrial raw materials grown on land as an enlargement of the Malthusian doctrine, whereby the future race may be compelled to choose between being warmed from the inside by food or warmed from the outside by clothing and dwellings. But it is necessary to bear in mind that modern improvements in the standard of living carry with them greatly enlarged consumption of industrial raw materials, at the same time that

food requirements are being reduced through substitution of machine power for manual labour and better protection of human beings from the elements.

Forms of Agriculture.—Considering the agriculture of the world dynamically, it may be separated into five divisions. One division includes land and labour devoted to the breeding and support of work animals. In some countries like India, this is the principal form of animal husbandry, since very rarely is use made of milk and meat. The flesh of work animals is generally used for food only in an incidental manner, but the hides commonly go into leather. The land used to raise and maintain work animals is usually adapted to the raising of primary food-stuffs. In advanced countries, work animals are being replaced by automotive machines; in backward countries, progress is being made in the use of animals to replace human workers.

The second division of agriculture includes land and labour devoted to the raising of animals primarily for production of industrial materials. There are now few countries in the world where animals are raised solely for wool and hides. The sheep, goats and cattle kept primarily for hides and wool furnish more or less milk and meat; indeed, in many countries meat is a joint product equal in importance with hides and wool. The land devoted to raising animals for hides and wool is to a large extent, in the present state of agriculture, not adapted to the raising of primary food-stuffs.

The third division of agriculture includes land and labour devoted to the raising of industrial plant products. Much of the land thus used in the temperate zone is adaptable to the other forms of agriculture, but in the tropics, this is less the case.

The fourth division of agriculture includes land and labour devoted to the raising of animals primarily for the production of milk and meat. Cattle may be used incidentally as work animals, and hides and wool are important joint products; but the primary purpose of such animal husbandry lies in the out-turn of secondary food-stuffs. In agriculture, the land devoted to such animal husbandry is usually adapted to the raising of primary food-stuffs, and is devoted to animal husbandry as the expression of economic or vocational choice.

The last division of agriculture includes the land and labour devoted to the raising of primary food-stuffs—tillage for harvested crops. Such land is also necessarily employed in the raising of feeding stuffs for domesticated animals.

These five divisions of agriculture overlap to some extent in all countries, varying according to the place and time. With improvements in transport and exchange, and with increase of population, these relations tend to change in the direction of increase in the agriculture devoted to primary food-stuffs with decrease in the agriculture devoted to animals and secondary food-stuffs. The conversion of nutrients into animal products is a wasteful process on account of the metabolic and caloric requirements of the animals. With continued increase in population, the food supply will tend to contain more of primary and less of secondary food-stuffs. If one can imagine a population of 5,000,000,000 on the globe, one must picture their diet as largely vegetarian with only such animal products (disregarding aquatic animals) as would be secured incidentally from work animals and such cattle, sheep, goats and swine as could subsist on land unadapted to the growing of primary food-stuffs plus the residues of primary food-stuffs devoted to human beings. Such animal husbandry, for a population of 5,000,000,000, might be as large as the present animal husbandry of the world, or larger, particularly in the event of control of animal diseases in tropical regions. Obviously, however, the intake of secondary food-stuffs, animal products of all kinds, would be lower than to-day. There is enough truth in the doctrine of vegetarianism to make it clear that with proper selection and combination of different plant products, a competent diet could be arranged to include only such animal products as could be secured without using for animals land adapted to the raising of primary food-stuffs.

Classes of Food-stuffs.—The food resources of the world are conditioned by (a) the agricultural potential of the land area of the earth; (b) the state of the arts and sciences in the culti-

vation of the soil, the raising of plants, the rearing of animals, and in the manufacture of food-stuffs; (c) the annual out-put of edible animals from fresh and salt waters; and (d) by the state of transport and exchange. The value of the food resources is to be measured in the light of the existing population of the globe. To some extent, these factors are static, but to a large extent they are dynamic. In a certain way, the food resources of the world are static in the same sense as are the resources of coal and iron; *i.e.*, they rest upon a chemical basis. But even in the case of minerals and metals, the resources are not to be measured solely by chemical analysis and geological surveys; they depend also upon the state of technique in the recovery of demonstrated deposits, and to that extent are dynamic. In the case of agricultural products, the static limitations imposed by composition of soil, rainfall and climate hold far less than in the case of minerals and metals, partly because the chemical elements involved are less circumscribed in quantity and location, and partly because there is in agriculture more of human art and less of nature than in the case of mining. In what follows we endeavour to present a succinct statement of the present food resources of the world. A static comparison of food supply with population has important immediate interest, but little import for the future. A dynamic comparison of food resources with population has little practical importance, but large import for the future.

A convenient classification of food-stuffs, commercial rather than botanical, separates the main food-stuffs into five groups: cereals, legumes, roots, oil-seeds and animal products. The remaining food-stuffs, mostly fruits and vegetables, though highly nutritive, have little importance as sources of energy and only incidental significance in international trade. Different peoples, in different regions and circumstances, cover their protein requirements with various amounts of animal products, cereals and legumes, and their caloric requirements with different amounts of carbohydrates and fats. The standard of subsistence is at once a cause and a result of agriculture and commerce.

Cereals.—The cereals are the most important food-stuffs, furnishing the largest proportion of calories. In a country like the United States, with a high standard of living, the cereals may contribute less than a third of the calories of the diet. In most of the countries of Europe it is over 50%. In Asia, cereals contribute over three-fourths of the calories of the diet. The important cereals are wheat, rice, maize, barley, oats, rye and the sorghum grains. The cereals are quite adaptable in agriculture, relatively non-perishable, and the crushed or milled products lend themselves well to culinary preparation, both in the home and in commercial avenues.

An estimate of the cereal crops of the world is to be undertaken only in very rough figures, since for large regions, especially Asia, reports are mere guesses. If in any year the grain fields of the world were to have large crops, the wheat would approximate 5,000,000,000bu., rye 2,000,000,000bu., corn 4,000,000,000bu., oats 4,500,000,000bu., barley 2,000,000,000bu., and rice 4,000,000,000 bushels. Converted into pounds, this would mean for the world population of 1,800,000,000 a per caput supply of about 600lb. per annum for all purposes. Grain used for seed and animal feed would represent a heavy proportion. Despite relatively small numbers of domesticated animals in Asia, contrasted with the human population, it is difficult to picture more than half of the grain produced in the world being consumed as food for human beings.

Wheat occupies the premier position, largely on account of gluten, which enables wheaten flour to be baked in loaves of yeast-leavened bread. Rye resembles wheat in this particular. Rice, maize, barley, oats and the sorghum grains do not lend themselves to the making of yeast-leavened bread. These grains are therefore used in the form of groat, grits, flakes or meals, prepared for ingestion by steaming, boiling, baked as biscuit or used as alimentary paste. To some extent, the preparation of cereals depends upon the cost and the nature of available fuel; this is one of the elements in the preference accorded to rice in Asia. Although wheat is raised in large amounts in both China and India, rice and millet are the predominating cereal.

While cereals may be consumed in their natural state, or crushed and milled without loss, it is customary to separate the cereal meals into a flour and offal fraction. The offal comprises the coat and the germ, including the bran; the flour corresponds roughly with the endosperm of the seed. In the case of rice, the offal is removed by polishing, without crushing the berry; a similar process is followed in the manufacture of pearl barley. Broadly speaking, in the manufacture of cereals into food-stuffs, between one-fourth and one-third of their weight is thus separated as offal. This offal is employed as concentrated feeding stuff for domesticated animals, for which it is highly prized. In regions where animal husbandry is undeveloped, cereals tend to be consumed in their entirety. Also, there is some consumption of whole-grain flour in all countries, since whole-grain bread is preferred by some to bread made of bolted flour. In fact, the offal of cereals contains elements of value in nutrition—mineral salts, vitamins and roughage. If one were subsisting solely on cereals, it would be necessary to consume them in their entirety. In a mixed diet it is a matter of choice. Bolted flour and whole-grain flour are both incomplete foods; in a diversified diet, however, the one is as good as the other, since it is possible to secure in fruits and vegetables the minerals, vitamins and roughage removed from grains in the manufacture of bolted flour. In countries with a diversified diet, the milk-equivalent of grain offal is more important than the offal as human food.

The cereal-raising capacity of the world is by no means fully developed. A world crop of 6,000,000,000bu. of wheat is possible within a relatively short time. Beyond the wheat lands lie the rye lands, rye being a hardier cereal than wheat, and representing the second line of bread defence. It would not be extravagant to suggest a world crop of 3,000,000,000bu. of rye, along with 6,000,000,000bu. of wheat. Corresponding expansions are also feasible for the other cereals. All in all, therefore, it would not seem out of perspective to envisage the gradual expansion of the world crop of cereals during the next century, to double the present volume if necessary. Since the per caput count of domesticated animals is expected to decline, a continuously larger proportion of cereals would be used as primary food-stuffs, and the expanded future population of the world would depend more upon cereals than at present.

Legumes.—Legumes (using the term in the broad sense to include all varieties of beans, peas, lentils and other pulses) have long been important as supplements to cereals. They are widely distributed, being as prominent in the diet in Central America as in China; however, we have no real statistics on production. Though relatively non-perishable, they are far less conspicuous than grain in international trade, though gram and soya bean are prominent articles of commerce. Most legumes are poor in fat, except the soya bean and peanut, rich in fat and often classified as oil-seeds. Legumes are richer in protein and poorer in starch than cereals. Legumes, being rich in protein, are substitutes for meat. Since legumes are a primary food-stuff, protein may be more cheaply secured therein, other things being equal, than in animal products. Therefore, with increase in population and its initial evidence of local pressure on food supply, legumes tend to supplant animal products as sources of protein. India and China may be cited in illustration, especially China, where the use of meat is restricted by economic conditions rather than by fanaticism or superstition. It is from this point of view that efforts are now being made in Europe to increase the production of soya beans in the hope of supplying the population with a cheaper source of protein than meat. Under usual circumstances, more protein can be secured from the unit of land in the form of legumes than in the form of grain and much more than in the form of meat. But that Europe is approaching the position where legumes need to be substituted for meat, as has long been the situation in China, is hardly to be believed. The position of soya bean products in the Chinese diet is an illustration of skilful adaptation in covering with available domestic food-stuffs the minimal requirements for the congested population. Had China been an industrialized nation, it is doubtful if the present Chinese dietary would have been evolved. Europe's export of manu-

factured goods and disposition of services in finance and trade, enable her to continue the customary diet of bread and meat. China's lack of export and undevelopment of transportation compelled her to perfect the national diet in the direction of legumes and away from meat. The different political spirit of Europeans and Chinese, as expressed in government and education, has of course played a large part in their historical developments.

As population increases, the production and consumption of legumes may be expected to expand, primarily in substitution of meat, and later possibly in substitution of grain. For North America, western Europe and the dominions of the British empire outside of India, this development lies in the distant future. For them, these legumes remain merely vegetables, in the United States, indeed, of declining use and not a staple source of protein in the national diet.

Roots.—Under roots we here class potatoes, sugar-beets, sugar-cane, fodder roots, cassava, sago-palm and analogous tropical products. These food-stuffs are largely composed of carbohydrates and are farinaceous, containing in their raw state only small amounts of protein and still less of fat. When refined by manufacture, they are practically pure starch or sugar. Consumed in the fresh state, these food-stuffs rank as vegetables; prepared in the dry state, they are highly valuable, because concentrated and practically non-perishable.

Though coming from a stalk and not from a root, cane sugar is to be classed with beet sugar. Before the World War, the world production of sugar was about 18,000,000 tons, of which about half was cane sugar and half beet sugar. The present sugar production is around 25,000,000 long tons, of which 16,000,000 are cane sugar and 9,000,000 tons are beet sugar. As a result of the World War, the production of cane sugar expanded, that of beet sugar contracted. With the recovery of beet sugar, the level of world sugar is rising. Broadly speaking, beet sugar is a product of the temperate zone, while cane sugar is a product of the tropical (or sub-tropical) zone. With selection of seed, protection from pests and diseases, and appropriate fertilization, the output of cane sugar on tropical lands seems to be a function of temperature. Much land adapted to sugar-cane is still available for future expansion of that crop and substantial increases in the yield per acre is demonstrably practicable. In the case of the sugar-beet, with selection of seed, control of diseases and pests, and appropriate fertilization, the output seems to be the function of hours of sunlight; and, other things being equal, the farther north the beet can be brought to maturity, the higher the sugar content. Large areas still remain adapted to the sugar-beet, so that substantial future expansion is practicable. The refining of sugar is an efficient and economical operation, producing a concentrated and non-perishable food-stuff of expanding importance in the diet and in international commerce. Both crops are restrained by hand-labour requirements, as yet unsolved by development of machines. A world crop of 30,000,000 tons of sugar is to be anticipated within a decade or two.

The world crop of potatoes is not even roughly measurable. The usual crop in North America and Europe except Russia, is around 100,000,000 long tons. Potatoes of one sort or another, white and sweet, are adapted to many climates and soils and give a large yield of calories per acre. Potatoes are of outstanding importance in Europe and North America. They have not secured the favour of oriental peoples, due presumably to the fact that the oriental diets are already low in protein. The potato is highly perishable, and does not lend itself to refining, as does the sugar-beet; considerable potato starch is prepared for food and industrial use, but nothing comparable with the refining of sugar. The potato remains, therefore, an important vegetable, of limited transportability, but highly valuable as human food, animal feeding stuff and material for the fabrication of alcohol.

The tropical flora include a number of plants whose roots, stalks and leaves contain large deposits of starch. Of these, the cassava and the sago-palm are the best known. The cultivation of these plants is expanding and land adapted to them is abundantly available. They are of course one-sided food-stuffs and need to be supplemented with protein. But as sources of cheap starch, they

are of considerable importance. These farinaceous products compete with rice rather than with wheat and are broadly comparable with the potato in the diet. The production of these food-stuffs may be expected to expand upon improvements in machinery for harvesting and refining quite as much as upon adaptability of soil.

Oil-seeds.—An important and expanding food resource has, within comparatively recent times, been uncovered in oil-seeds. Under this term are included all seeds and nuts that are rich in oil; the segregation of grains from oil-seeds is of course to some extent arbitrary. The important oil-seeds include flax, tung, olive, sunflower, rape, sesame, soya-bean, peanut, cotton, palm, palm kernel and coconut. Some of the plants are annuals or perennials, some are legumes; some come from grasses, others from trees; some are strictly tropical or sub-tropical, others widely distributed over the temperate zone.

Oil-seeds contain starch and protein as well as fat. Contrasted with grains, they contain much more fat and protein but much less starch. Since protein is relatively scarcer than fat and starch, oil-seed crops would seem to possess some advantage over grain crops; but for several reasons, both agricultural and nutritional, the theoretical advantages of an oil-seed crop frequently disappear in practice. The principal disadvantage of the oil-seed crop is that the unexpressed meal is unadapted to culinary uses, while the expressed meal is much less esteemed than flour. In the case of the soya-bean, the Chinese have developed uses whereby the expressed meal, freed of fat, finds uses comparable to those of meals from grains. But in Europe, the expansion of soya-bean growing is limited by disinclination of the public to expand the food use of the expressed residue. To use the meal as feeding stuff is an imperfect solution of the problem, because the recovery of the protein in terms of edible animal products will be not over one-third, and often less, of the protein of the oil-seeds. To raise an oil-seed primarily as a source of fat, with secondary utilization of the protein and starch as feeding stuffs, is much less advantageous than if two or all three could be employed as food-stuffs. Up to the present, the fat-free residues of coconut, palm, palm kernel, peanut, sunflower and flax are used largely as feeding stuffs, and for little else. Nevertheless, oil-seeds have a large importance as a food resource, and as a concentrated feeding stuff, the residues are highly important in the industrialized countries of Europe and North America.

Apparently, the production of oil-seeds could be greatly expanded if agricultural hindrances in the tropics could be overcome and the utilization of the fat and carbohydrate as food-stuff brought into conformity with established customs and tastes. In a certain sense, it was tropical oil-seeds that made possible the present industrialization of Europe. To what extent added expansion in tropical oil-seeds will contribute to the further development of industrialism in Europe, indirectly by providing feeding stuffs for European animals or directly by providing food-stuffs, is a matter on which it is hardly possible or desirable to speculate. When one attempts to forecast the future use of oils and fats in the diet, it is necessary to realize that to a considerable extent vegetal oils and fats are competitive with animal oils and fats and that consumption may shift from one to the other. The tropical regions possess surpluses of vegetal oils; nevertheless, animal fats (butter, milk, lard and pork) are shipped in to meet the desires of the white population. On the other hand, the industrial nations of the northern temperate zone are increasing the use of vegetal oils from the tropics. It is not possible to say whether the use of vegetal oils and fats in Europe and North America is merely additive, supplementing animal oils and fats; or whether, and if so to what extent, it represents a substitution. In any event, it is clear that for some countries the point must have been reached where the current use of vegetal oils is in partial replacement of animal oils and fats. Certainly also, it is difficult to doubt that in the future the trend toward substitution is likely to become more pronounced. It is hard to interpret otherwise the enormous expansion in the manufacture of vegetal lard substitutes in the United States and vegetal butter substitutes in Europe. When the imitations are made technically perfect, use will be based on price. Vegetal lard substitutes have made little

headway in Europe and vegetal butter substitutes have made little headway in the United States. We do not expect the use of butter substitutes to expand rapidly in the United States, but it is to be anticipated that the use of vegetal lard substitutes will expand largely in Europe. Gradually it will become true for the food supply, as it already is for the manufacture of soap, that one fat is practically as good as another.

Domesticated Animals.—It is difficult to form an opinion on the count of domesticated animals in the world. Except for countries with unusual development of the census of animals, the data are both fragmentary and untrustworthy. The world over, animal husbandmen—whether nomads, peasants or squires—conceal animals in order to avoid taxes. Of the count of animals in backward pastoral countries little is known. The number of animals on public ranges tends to decline, certainly in North America. On the other hand, animals tend to increase in the diversified agriculture of advanced countries. The losses of the World War have been restored and the inflations liquidated. Taking the figures at their face value, the world population of domesticated animals has been estimated as follows, in rounded figures: horses, mules and asses, 140,000,000; cattle, 580,000,000; swine, 200,000,000; sheep and goats, 860,000,000; camels and buffaloes, 60,000,000. These estimates are too low, especially for asses, sheep, goats, camels and buffaloes; but how much too low is indefinite. Apparently, the world population of domesticated animals is almost as large as that of human beings, but the subsistence requirements of the latter are much larger. With improvements in transport and in the standard of living, one might expect an increase in domesticated animals, yet it is doubtful if this can be demonstrated. A per caput increase in domesticated animals is certainly not in evidence, but a shift from cattle to swine is possible.

More important than the number of domesticated animals is the improvement in grades. With each generation measurable progress is achieved in all except backward countries. Through breeding and selection, improved types are secured; animals are brought to maturity earlier, by better utilization of nutrients, and the turn-over is increased. In the case of sheep, improvement is attained both in wool and in the carcass. In the case of cattle, the frame and flesh are being improved, but the improved breeds do not possess the heavy hides of unimproved breeds. With each decade, the average annual secretion of milk rises, and the return of milk per unit of nutrient is enlarged. The same fact holds for swine; both the lard-type and bacon-type hogs are brought to maturity earlier and the return of nutrients in the form of edible products is enlarged. In the case of all animals, a considerable part of the gains have been the result of cutting down the mortality in early life, thus increasing the turn-over of the breeding stock. In short, while the number of animals per million inhabitants may be declining, the out-put of edible products per head of population may be increasing. However, we have no trustworthy statistics.

The meat consumption of the world is very unevenly distributed, the highest being observed in Australasia, Argentina, Canada and the United States, the lowest, in Asia. Consumption of meat is influenced not merely by the state of agriculture, relation of population to area and limitation of transport, but also by fanaticism and superstition, as is illustrated in the dietaries of Hindus, Mohammedans and Jews. Occasionally one observes a country, such as Japan, in which consumption of fish takes the place of consumption of butcher meats; but for the most part, fish cannot be relied upon to replace the flesh of domesticated animals.

It seems reasonable to conclude that the consumption of milk may everywhere be expected to increase. Fanaticism and superstition do not oppose the use of milk. With improvement in the herds in pastoral countries, incidental milk production tends to increase. The decline of animal husbandry on public ranges, with increase in diversified agriculture, represents enlargement in the production of milk. Finally, improvements in the manufacture of butter, butter oil, cheese, condensed milk and dried milk are gradually making practicable the utilization of the milk of animals in outlying regions. The importance of this trend of developments

is enhanced by the fact that the milch cow is an efficient converter of feeding stuff into food-stuff.

Sea-food.—The resources of the sea are measurable with less accuracy and greater difficulty than those of the land. The sea area of the globe is four times that of the land, but the productivity is very much lower. Aquatic animals depend on aquatic plants and there is little plant life in water over 200ft. deep. The shallow area of the sea is estimated at less than 2,000,000,000 acres. Even if the plant growth in the shallow sea were comparable with that on land, the return in edible animal products cannot be as large relatively as on land. Thus appraised, the food-producing potential of the seas appears low. The growth of marine plants must be conditioned to some extent by the availability of soluble salts of potassium, phosphorus and nitrogen utilizable by plants. These are being continuously added to the sea with the inflow of waters from the land. Probably bacterial fixation of atmospheric nitrogen occurs in sea water, and possibly conversion of insoluble into soluble phosphates through the action of micro-organisms. But these elements would seem to be distinctly limited in sea water except close to land. It is practically impossible to estimate the number of aquatic animals, to appraise the rate of growth, the limitations of the food supply and depredations of natural enemies and diseases. For a few species of marine animals, it is known that the numbers are declining—for example, whales, sturgeon and salmon. For other varieties, much less is known. The general impression is that the resources of the fresh waters are declining rapidly and those of salt waters less rapidly but still progressively.

To some extent marine animals find uses outside of the diet. Substantial amounts are employed as fertilizer and animal feed. The oils and fats find widespread uses in industry. For some marine animals, extermination is to be feared because of their exploitation for industrial materials.

The technique of catching fish and other marine animals has been highly perfected within recent years, and distribution and utilization have been advanced by technical developments. Fish do not need to be salted, but may be transported frozen over long distances. Extensive processing and packing may occur on the high seas. Marine fats may now be so refined and transformed as to become substitutable for vegetal and animal oils and fats. Thus, from marine fats may be prepared butter substitutes that are nearly as good imitations as margarines prepared from vegetal oils. Up to the present, the public is unsympathetic to such substitutions; but experience teaches that this attitude will wear off with time. The future questions are not the extent to which marine materials may be adapted to food uses, nor the conversion of the public to such use, but rather the quantity of material available and the prospective length of time over which new industries might count on supplies large enough to make it worth while to develop the business.

The present use of the flesh of fish and other marine animals in the human diet cannot be measured. For North America, the fish of salt and fresh waters are little more than incidental luxuries; but in the countries of western Europe, in regions surrounding certain inland seas, like the Caspian, and in the coastal regions of Asia, fish constitute an important part of the diet. The trend of output is impossible to estimate. Over-catching is difficult of restraint, both in inland and territorial waters, and especially on the high seas. Gradually we are coming to question the practical results of artificial propagation in hatcheries. Pollution, whether by oil film on the surface, suspension of insoluble particles, or solution of noxious chemicals, has everywhere widespread and destructive effects, especially to the young. Apparently, fresh and coastal water fish are on the decline, also fish that come from deep-sea water to spawn in fresh water or vice versa. The whale, walrus, seal and other large marine animals are, only incidentally, sources of food supply. With respect to other marine animals, the evidence is less conclusive. Fishing on the high seas is at present largely confined to banks, most of which are adjacent to the mainland, of which the banks off western Europe and Newfoundland may serve as illustrations. It is difficult to measure the trend of fish supply on such banks. With replacement of sails with motors, the efficiency of fishing and radius of cruising are

much increased. There is the feeling in trade circles that the supplies of cod, herring, halibut and mackerel are on the decline. Beyond this, there is a popular notion that practically unlimited numbers of fish exist in deeper and more distant waters (especially tropical waters) awaiting improvement in methods of fishing, with the technique of refrigeration already perfected. Just how extensive are such supplies of fish, what are the limitations of season and the costs of procurement are not known. One cannot, however, resist the inference that the importance of deep-sea fish, like that of the reindeer, is more hypothetical than demonstrated.

In a mixed diet the flesh of fish, on the basis of dry weight, has about the same value as the flesh of domesticated animals. The fats of fish differ rather widely from those of domesticated animals, but by modern technological methods lend themselves both to industrial and dietary uses. Refrigeration and canning make the flesh of fish as safe and dependable as that of domesticated animals. It is, however, doubtful if the flesh of fish will ever exert a world-wide appeal as a food of preference. The use of fish on fast-days has not tended to favour its use as a regular article of diet. On the whole, the flesh of aquatic animals contributes relatively little to the food supply of the world in terms of calories and for the immediate future the prospect is for decline rather than for increase.

Minerals and Vitamines.—Minerals and vitamins are indispensable factors in the diet. Very often, otherwise adequate diets have failed because of shortage in these essential factors. A normal ration of minerals and vitamins is not only of direct importance in maintenance of health, it is indirectly of importance in extending the effectiveness of an otherwise minimal intake of protein, fat and carbohydrate. Fortunately, such shortage need no longer be feared, since information on the processes of nutrition and advances in manufacturing technique make it readily possible to supply balanced salt rations and adequate intakes of vitamins.

Industrial Utilizations.—Food-stuffs have important industrial uses. This holds especially true of starch and fat, starch being the common material for the fabrication of alcohol, while fat is the raw material for soap-making and other industrial processes. The more alcohol made from sugar residues, straw and sawdust, the less demand for grain for this purpose. The larger the use of oils and fats in industrial directions, the heavier the competition to be encountered by oils and fats as food-stuffs. For the most part, the tendency has been toward increase in the industrial use of oils and fats. In several directions, however, the contrary is to be observed, substitutes in industrial uses replacing oils and fats previously employed. Paints and varnishes containing linseed oil are being widely replaced by pyroxylin enamels prepared from cellulose. At present, this is limited to automobiles, railway cars, steamships and household interiors, but it is not improbable that paints may be replaced for commoner exterior uses. Mineral and other non-fat detergents are taking the place of soap. During the World War substantial technical progress was achieved in the perfection of substitutes for soap and the future limit of such substitution is not yet definable. The total use of detergents is greatly on the increase, but in many directions soaps are being replaced by cheaper substitutes. Mineral lubricants are replacing lubricants made of animal and vegetal oils and fats. Lastly, the use of vegetal and animal oils and fats as illuminants is being everywhere replaced by mineral oils, gas or electricity, surviving only for sacramental and social occasions not involving large volumes of the materials.

Conclusion.—The food resources of the world have never been more ample for the population than at present. This is the result of developments in agriculture, perfection of transportation, improvements in distribution, reduction in wastes and efficiencies in finance and commerce. Expansion in manufacturing, the so-called industrial revolution, has been accompanied by growth in agriculture and improvement in the standard of living. Improvement in the standard of living in turn reacts upon agriculture, as upon manufacturing. There is no sign that these bilateral movements are approaching a decline. (A. E. T.)

FOOD VALUES: see DIET AND DIETETICS; NUTRITION.

FOOL, a stupid person; a buffoon or jester.

Professional fools or jesters appear to have existed in all times and countries. Not only have there always been individuals naturally inclined and endowed to amuse others; there has been in most communities a definite class, the members of which have used their powers or weaknesses in this direction as a regular means of livelihood. *Scurrae* and *moriones* were Roman parallels of the mediaeval witty fool; and during the empire the manufacture of human monstrosities was a regular practice, slaves of this kind being much in request to relieve the languid hours. After the conquest of Mexico court fools and deformed human creatures of all kinds were found at the court of Montezuma.

The dress of the court fool of the middle ages was not altogether a rigid uniform. To judge from the prints and illuminations which are the sources of our knowledge on this matter, it seems to have changed considerably from time to time. The head was shaved, the coat was motley, and the breeches tight, with generally one leg different in colour from the other. The head was covered with a garment resembling a monk's cowl, which fell over the breast and shoulders, and often bore asses' ears, and was crested with a cockscomb, while bells hung from various parts of the attire. The fool's bauble was a short staff bearing a ridiculous head, to which was sometimes attached an inflated bladder, by means of which sham castigations were effected. A long petticoat was also occasionally worn, but seems to have belonged rather to the idiots than to the wits.

The fool's business was to amuse his master, to excite him to laughter by sharp contrast, to prevent the over-oppression of State affairs, and, in harmony with a well-known physiological precept, by his liveliness at meals to assist his lord's digestion. The names and witticisms of many of the official jesters at the courts of Europe have been preserved by popular or State records. In England the list is long between Hitard, the fool of Edmund Ironside, and Muckle John, the fool of Charles I., and probably the last official royal fool of England. Many are remembered from some connection with general or literary history.

Richard Tarleton, famous as a comic actor, cannot be omitted from any list of jesters. A book of Tarleton's *Jests* was published in 1611, and, together with his *News out of Purgatory*, was reprinted by Halliwell Phillips for the Shakespeare Society in 1844. Archie Armstrong, for a too free use of wit and tongue against Laud, lost his office and was banished from the court. In French history, too, the figure of the court-jester flits across the gay or sombre scene at times with fantastic effect. In Germany, Rudolph of Habsburg had his Pfaff Cappadox, Maximilian I. his Kunz von der Rosen.

Late in the 16th century appeared *Le Sottilissime Astuzie di Bertoldo*, which is one of the most remarkable books ever written about a jester. It is by Giulio Cesare Croce, a street musician of Bologna, and is a comic romance giving an account of the appearance at the court of Alboin, king of the Lombards, of a peasant wonderful in ugliness, good sense and wit. The book was for a time the most popular in Italy.

That the private fool existed as late as the 18th century is proved by Swift's epitaph on Dicky Pearce, the earl of Suffolk's jester, but the professional fool died out soon after his day of glory in the Elizabethan period. The principle of his existence has lasted to the present day; he disappeared in name only. In the circus and the rodeo, he is the clown; in the motion picture, he is the slap-stick comedian; in the ventriloquist act, he is the clever repartee—the "dummy"; in the opera, the comedy-drama, the musical comedy, he appears under various names.

See Flügel, *Geschichte der Hofnarren* (Leipzig, 1789); Doran, *The History of Court Fools* (1858); Olive M. Busby, *Studies in the Development of the Fool in the Elizabethan Drama* (1923).

FOOLS, FEAST OF, the name for certain burlesque, quasi-religious festivals which, during the middle ages, were the ecclesiastical counterpart of the secular revelries of the Lord of Misrule. (Lat. *festum stultorum, foliorum*; Fr. *fête des fous*.) The celebrations are directly traceable to the pagan Saturnalia of ancient Rome which, in spite of the denunciation of bishops and ecclesiastical councils, continued to be celebrated by the people with all

their old licence. In the 11th century Bishop Burchard of Worms thought it necessary to fulminate against the excesses connected with it. The clergy set apart certain days as special festivals for different orders: the feast of St. Stephen (Dec. 26) for the deacons, St. John's day (Dec. 27) for the priests, Holy Innocents' Day for the boys, and for the sub-deacons Circumcision, the Epiphany, or Jan. 11. The Feast of Holy Innocents became a festival of children, in which a boy, elected by his fellows of the choir school, functioned solemnly as bishop or archbishop, surrounded by the elder choir-boys as his clergy. (*See* BOY-BISHOP.) At first there is no evidence to prove that these celebrations were characterized by any indecorous behaviour; but in the 12th century such behaviour had become the rule. In 1180 Jean Belet, of the diocese of Amiens, calls the festival of the sub-deacons *festum stultorum*. A young sub-deacon was elected bishop, vested in the episcopal insignia (except the mitre), and conducted by his fellows to the sanctuary. A mock mass was begun, during which the lections were read *cum farsia*, obscene songs were sung and dances performed, cakes and sausages eaten at the altar, and cards and dice played upon it.

This burlesquing of things sacred, though condemned by serious-minded theologians, conveyed to the child-like popular mind of the middle ages no suggestion of contempt, though when belief in the doctrines and rites of the mediaeval Church was shaken, it became a ready instrument in the hands of those who sought to destroy them. This naïve temper of the middle ages is nowhere more conspicuously displayed than in the Feast of the Ass, which under various forms was celebrated in a large number of churches throughout the West. Often the ass was a mere incident in the Feast of Fools; but sometimes he was the occasion of a special festival, ridiculous enough to modern notions but by no means intended in an irreverent spirit.

Celebration at Beauvais.—A singular celebration at Beauvais, which was held on Jan. 14, represented the flight into Egypt. A richly-caparisoned ass, on which was seated the prettiest girl in the town, holding in her arms a baby or a large doll, was escorted with much pomp from the cathedral to the church of St. Étienne. There the procession was received by the priests, who led the ass and its burden to the sanctuary. Mass was then sung; but instead of the ordinary responses to the *Introit*, *Kyrie*, *Gloria*, etc., the congregation chanted "Hinham" (Hee-haw) three times. The rubric of the mass for this feast actually runs: *In fine Missae Sacerdos versus ad populum vice, Ite missa est Hinhamabit: populus vero vice, Deo Gratias, ter respondebit Hinham, Hinham, Hinham.* (At the close of the mass the priest, turning to the people, instead of saying, *Ite missa est*, shall bray; the people, instead of *Deo gratias*, shall thrice respond Hee-haw, Hee-haw, Hee-haw.)

Celebration at Sens.—At Sens the Feast of the Ass was associated with the Feast of Fools, celebrated at Vespers on the Feast of Circumcision. The clergy went in procession to the west door of the church, where two canons received the ass, amid joyous chants, and led it to the precentor's table. Bizarre vespers followed, sung falsetto and consisting of a medley of extracts from all the vespers of the year. Between the lessons the ass was solemnly fed, and at the conclusion of the service was led by the precentor out into the square before the church (*conductus ad ludos*); water was poured on the precentor's head, and the ass became the centre of burlesque ceremonies, dancing and buffoonery being carried on far into the night.

Various efforts were made during the middle ages to abolish the Feast of Fools. How little effect these had, however, is shown by the fact that in 1265 Odo, archbishop of Sens, could do no more than prohibit the obscene excesses of the feast, without abolishing the feast itself; the festival was, in fact, too popular to succumb to these efforts, and it survived throughout Europe till the Reformation, and even later in France; for in 1645 Mathurin de Neuré complains in a letter to Pierre Gassendi of the monstrous fooleries which yearly on Innocents' Day took place in the monastery of the Cordeliers at Antibes.

(Lausanne, 1741); Aimé Cherest, *Nouvelles recherches sur la fête des Innocents et la fête des Fous dans plusieurs églises et notamment dans celle de Sens* (1853); Schneegans in Müller's *Zeitschrift für deutsche Kulturgeschichte* (1858); H. Böhmer, art. "Narrenfest" in Herzog-Hauck, *Realencyklop.* (ed. 1903); Du Cange, *Glossarium* (ed. 1884), s.v. "Festum Asinorum."

FOOLSCAP, the cap, usually of conical shape, with a cockscomb running up the centre of the back, and with bells attached, worn by jesters and fools (*see* FOOL); also a conical cap worn by dunces. The name is given to a size of writing or printing paper, varying in size from 12x15 in. to 17x13½ in. (*see* PAPER). The name is derived from the use of a "fool's cap" as a watermark. A German example of the watermark dating from 1479 was exhibited in the Caxton exhibition (1877).

FOOL'S PARSLEY, in botany, the popular name for *Aethusa Cynapium*, of the family Umbelliferae, a common weed in cultivated ground in Great Britain and sparingly naturalized in the eastern United States and Canada. It is an annual herb, with a fusiform root and a smooth hollow branched stem 1 to 2 ft. high, with much divided (ternately pinnate) smooth leaves and small compound umbels of small irregular white flowers. The plant has a nauseous smell, and, like various other members of the family (e.g., hemlock), is poisonous.

FOOT, the lower part of the leg, in vertebrate animals consisting of tarsus, metatarsus and phalanges, on which the body rests when in an upright position, standing or moving (*see* ANATOMY: *Superficial and Artistic*; and SKELETON: *Appendicular*). The word is also applied to such parts of invertebrate animals as serve as a foot, either for movement or attachment to a surface. From the resemblance to the foot, in regard to its position, as the base of anything, or as the lowest member of the body, or in regard to its function of movement, the word is applied to the lowest part of a hill or mountain, the plate of a sewing-machine which holds the material in position, to the part of an organ pipe below the mouth, and the like. In printing, the bottom of a type is divided by a groove into two portions known as "feet." Probably referring to the beating of the rhythm with the foot in dancing, the word was applied in prosody to a grouping of syllables, one of which is stressed, forming the division of a verse. "Foot," i.e. foot-soldier, was formerly with an ordinal number prefixed, the name of the infantry regiments of the British Army. It is now superseded by territorial designations, but is used in the five regiments of the Infantry of the Household, the Foot Guards. As a lineal measure of length the "foot" is of great antiquity, estimated originally by the length of a man's foot (*see* MEASURES AND WEIGHTS). For the ceremonial washing of feet (*see* MAUNDY THURSDAY).

FOOT-AND-MOUTH DISEASE (Aphthous Fever, Epizootic Aphtha, Eczema Epizootica), a virulent contagious and inoculable malady of animals, characterized by initial fever, followed by the formation of vesicles or blisters on the tongue, palate and lips, sometimes in the nostrils, fourth stomach and intestine of cattle, and on parts of the body where the skin is thin, as on the udder and teats, between the claws, on the heels, coronet and pastern. The disease begins suddenly and spreads very rapidly. A rise of temperature precedes the vesicular eruption, which is accompanied by salivation and a peculiar "smacking" of the lips. The vesicles gradually enlarge and eventually break, exposing a red raw patch, which is very sensitive. The animal cannot feed so well as usual, suffers much pain and inconvenience, loses condition, and, if a milk-yielding creature, gives less milk, or if pregnant, may abort. More or less lameness is a constant symptom, and sometimes the feet become very much diseased and the animal is so crippled that it has to be destroyed. It is often fatal to young animals. It is transmitted by the saliva and the discharges from the vesicles, though all the secretions and excretions are doubtless infective, as well as all articles and places soiled by them. This disease can be produced by injecting the saliva, or the lymph of the vesicles, into the blood or the peritoneal cavity. The cause of the disease is a filter passing virus (*q.v.*).

If we were to judge by the somewhat vague descriptions of different disorders by Greek and Roman writers, this disease has

been a European malady for more than 2,000 years. But no reliance can be placed on this evidence, and it is not until we reach the 17th and 18th centuries that we find trustworthy proof of its presence, when it was reported as frequently prevailing extensively in Germany, Italy and France. During the 19th century, owing to the vastly extended commercial relations between civilized countries, it has, like the lung-plague, become widely diffused. In the Old World its effects are now experienced from the Caspian sea to the Atlantic ocean. Hungary, Lower Austria, Bohemia, Saxony and Prussia were invaded in 1834. Cattle in the Vosges and in Switzerland were attacked in 1837, and the disease extending to France, Belgium and Holland, reached England in 1839, and quickly spread over the three kingdoms (*see also under AGRICULTURE*). At this time the importation of foreign animals into England was prohibited, and it was supposed that the infection must have been introduced by surplus ships' stores, probably sheep, which had not been consumed during the voyage. This invasion was followed at intervals by 11 distinct outbreaks, and for a period after 1902 Great Britain was free of foot-and-mouth disease. Since the World War the disease has appeared in numerous districts but has been held in check by restriction of movement of cattle over a radius of 15m. from the centre of infection and compulsory slaughtering of diseased animals. From the observations of the best authorities it would appear to be an altogether exotic malady in the west of Europe, always invading it from the east; this has been the course noted in all the principal invasions. It was introduced into Denmark in 1841; and into the United States of America in 1870, from Canada, where it had been carried by diseased cattle from England. It rapidly extended through cattle traffic from the State first invaded to adjoining States, but was eventually extinguished, and does not now appear to be known in North America. It was twice introduced into Australia in 1872, but was stamped out on each occasion. It appears to be well known in India, Ceylon, Burma and the Straits Settlements. In 1870 it was introduced into the Andaman islands by cattle imported from Calcutta, where it was then prevailing, and in the same year it appeared in South America. In South Africa it is frequently epizootic, causing great inconvenience, owing to the bullocks used for draught purposes becoming unfit for work. These cattle also spread the contagion. It is not improbable that it also prevails in central Africa, as Schweinfurth alludes to the cattle of the Dinkas suffering from a disease of the kind.

In 1926 a disastrous epidemic occurred in Scotland which was traced to a bacon factory receiving weekly consignments of fresh carcasses of pigs from Europe. In consequence the importation of fresh carcasses and their offals from Europe was prohibited. In January 1927 the Foot-and-Mouth-Disease Research Committee reported that they had found by experiment that bone-marrow from infected carcasses kept at 22° remains infective for 42 days and kept at 15° remains infective for 76 days. Blood kept at either of the two low temperatures remains active for 30-40 days. In 1928, negotiations were proceeding between Great Britain, Argentina, Brazil and Uruguay to prevent the export to Great Britain of the carcasses of animals killed during the infective stage of the disease or of animals that had been in contact with them. The Argentine Government thereon passed a decree on Feb. 1, 1928, and similar decrees by other Governments were pending.

Though not usually a fatal malady, except in very young animals, or when malignant, yet it is a most serious scourge. In one year (1892) in Germany, it attacked 150,929 farms, with an estimated loss to the owners of £7,500,000 sterling. It is transmissible to nearly all the domestic animals, but its ravages are most severe among cattle, sheep, goats and swine. Human beings are also liable to infection.

The treatment of affected animals comprises a laxative diet, with salines, and the application of antiseptics and astringents to the sores. The preventive measures recommended are: isolation and slaughtering of the diseased animals, boiling the milk before use, and thorough disinfection of all places and substances which are capable of conveying the infection.

FOOTBALL. Few of the investigators who tried to discover the origins of the game of football have gone very far, for they have soon found that the sport of football as enjoyed by ancient peoples had no relation to the organized game which is played in modern times. The early history of football, in England, and its nature, are also obscure. Joseph Strutt, writing in 1801, said: "It was formerly much in vogue among the common people, though of late years it seems to have fallen into disrepute and is little practised." Yet at the same time he had hazy ideas that some sort of a football game was then being played in England, for he adds that when a match of football is played there are two goals, with a distance of 80 or 100 yards between them, that the object of each party is to drive the ball, a blown bladder cased with leather, through the goal of its antagonist, and that sometimes the players kick each others' shins without the least ceremony. Only in the '50s of last century did sane order begin to appear and the basis was laid for the distinction between Rugby and Association. (*See FOOTBALL, ASSOCIATION; FOOTBALL, RUGBY.*)

FOOTBALL, ASSOCIATION. Out of the chaos existing during the '40s and '50s emerged certain clubs which considered that football was a game to be played with the feet and not with the hands, and certain other clubs which regarded carrying the ball as the salt of the game. The advocates of football for the feet were the first to take any decisive actions and in 1848 or 1849 a meeting was held at Cambridge attended by old boys from Eton, Harrow, Winchester, Rugby and Shrewsbury. A list of rules was drawn up and published as "The Cambridge Rules," but what they were, or what became of the printed rules, or whether they were ever put into action, is unknown. The next attempt of which there is any record was made in 1862 when a set of rules was drawn up and published, with no known results. In the meantime the number of clubs had increased, and Sheffield (1855), Blackheath (1857), Hallamshire (1857), Old Harrovians (1859), and the Forest F.C. (1860?), afterwards known as "The Wanderers," were among the earliest of any note. In Oct. 1863 another determined effort was made, and a code of rules was drawn up at Cambridge and published. In the same month a meeting of representatives of the chief London and other clubs was held at the Freemasons' Tavern, Great Queen street, and the Football Association was formed. The Blackheath club, which played the carrying game, was willing at first to join the new association, but when the rules were published on Dec. 1, it protested against the omission of the permission to hack, and withdrew. Henceforth each party played in its own way.

The Laws and the Off-side Rule.—When the laws of Association football were first published in 1863 they were recognized as good work; they were expressed clearly and so easy to understand. But there was one law which, although it was easy to understand, was difficult to carry out. This was the off-side rule, which from 1866 to 1926 read as follows: "When a player plays the ball, or throws it in from touch, any player of the same side who at such moment of playing or throwing in, is nearer to his opponents' goal-line, is out of play, and may not touch the ball himself, nor in any way whatever interfere with an opponent, until the ball has been played, unless there are at such moment of playing or throwing in, at least three of his opponents nearer their own goal-line. A player is not out of play in the case of a corner kick, or when the ball is kicked off from goal, or when it has been last played by an opponent."

The difficulty of applying the law is concerned with the words "at such moment of playing or throwing in." Suppose a centre forward (A) has the ball at his feet at the half-way line, that the outside left (B) is behind the half-way line, and that seven or eight of the opposing side are in their own half. A now kicks the ball forward and high towards the left touch line; the attention of the players and probably the referee is naturally directed to the spot where the ball will drop. But just as it is about to fall B suddenly arrives, having rushed up, and takes the ball on with him, only two of the opposing side being now between him and the goal-line. B is obviously not off-side, for when the ball was kicked by A he was behind the kicker. But from the crowd would come

a vociferous shout of "off-side!" and it was not unlikely the referee would blow his whistle. This difficulty of seeing exactly where each forward is placed at the moment of kicking has been the cause of endless disputes; but if there is an off-side law at all there must always be this difficulty, which may easily be exaggerated. A player could not (in 1928) be off-side in his own half of the ground, but may as before be off-side unless there are at least two opponents between him and the goal-line. But the difficulty of application has only been altered, not removed.

For a few years after the World War there was often consternation among the forwards when the opposing side played the "one-back" game. That is to say, one of the two backs would suddenly advance and place a forward off-side. The manoeuvre was exploited with great success by McCracken, an Irishman playing for one of the Football League clubs, but it gradually died out. Many forwards learned that by passing back they could easily outwit the "one-back" method. Most of the other laws have been slightly altered as the years have gone by, and the law as to throwing in from touch has been changed several times. At one period the thrower need use but one hand, and strong men like William Gunn and George Brann could throw it in this way as far as a man could kick.

THE GAME AND ITS GREAT PLAYERS

There can be no doubt that one of the chief reasons why the Association game is so popular is that although in its highest

PLAN OF FIELD AND POSITION OF PLAYERS AT THE KICK-OFF

form it gives scope for an immense amount of skill, it can be played and thoroughly enjoyed by those who have hardly any skill at all. Another excellent reason is that a spectator who has hitherto never seen a game of football can in a few minutes follow the progress of the game with ease and understanding. To learn the rudiments of the game is a matter of a few minutes. With the aid of the accompanying plan a would-be spectator or player can see how the different players are standing just before the game begins. When the ball is kicked off from the centre by

the centre-forward of one side, he generally pushes it gently forward in such a way that his inside left or inside right may get to it first. Whether he or one of the opposing side gets it, the game is in progress, and resolves itself into a continued struggle between the two sides for the possession of the ball. In a general way the players will keep their relative positions wherever the ball may be, so that there is not the same difficulty in following their movements as there is in the Rugby game, in which, to the uninitiated spectator, the players may in a few minutes seem hopelessly mixed up. In the Association game the attacking force, the forwards, pass the ball to each other until the defending force of the other side, the half-backs and backs, take it away from them and give their own forwards a chance to attack. But except on the rarest occasions there is no confusion, and each player should be found in his proper position. The skill shown by the forwards in passing the ball to each other, and by the half-backs and backs in taking the ball from them and passing to their own forwards, is a continual feast of pleasure to the spectators; sometimes this skill is lacking when the forwards have a chance of kicking a goal.

The Dribbling Period.—In the years which immediately followed the formation of the Football Association, the forwards, as an attacking force, concerned themselves very little with passing; they made progress chiefly by keeping the ball close to their feet and dribbling it, often at a great pace, round one defender after another, until it was taken away from them. It might seem to-day that the backs and half-backs would have a very easy time if dribbling were the only means of progression; but some of the old dribblers were so quick in their movements, so clever and so elusive, that the task of stopping them was anything but easy.

In estimating the position held in the football world by a player who is gone, it must be remembered that whereas a cricketer leaves behind him invaluable records in the way of scores or analyses, a footballer leaves nothing but his memory. He can only be judged by the men of his own time, and their opinions often differ widely. Hence in attempting to give the names of the greatest players of their time it is only possible to pick out men who were generally regarded by their contemporaries as being in the very first rank—there can be no finality and no unanimity. The Association game, moreover, by its very nature does not give the same scope as Rugby for a player to force himself clear above all his contemporaries, but it produces many great players of about equal ability.

The Years of Passing and Dribbling—First Period.—Many people think that the years between 1880 and 1896 were the palmy days of Association football.

The forward play was very good, and by its very excellence produced good defenders. The old dribbling forwards still playing had become experts in passing, but at that time men passed only when they thought a comrade was in a better position to take the ball, or had a better chance of scoring: they did not neglect the art of dribbling. Old players can still feel a thrill when they remember the glad shout of the spectators, "He's off," when William Gunn (Notts.), George Brann (Ardingly and Swifts and the Sussex cricketer) or W. I. Bassett (West Bromwich Albion) on the right wing, or W. J. Townley (Blackburn Rovers) on the left wing, received the ball near his own goal and sprinted up the line, apparently with quite a straight run, but in reality dodging with the greatest cleverness. The defenders never knew what they might do with the ball, for they might pass it when half way up the ground, or go straight to the corner and then centre just in front of the goal. Nor will old players ever forget the long, elusive runs and deft passes of W. N. Cobbold (Charterhouse and Cambridge), whose contemporaries are agreed that he was the very best forward the game had so far produced. At inside left he was magnificent as a dribbler, being very elusive and very fast, getting into his pace at once. Above all, he had the instinct of knowing when to shoot at goal, and the ability to turn the instinct to good account.

The Second Period.—At the beginning of the '90s, passing had become something like an exact science, and dribbling was

not so frequently practised. The consequence was that there were fewer opportunities for special distinction, and outstanding players became less numerous.

But this was a period of great levelling up from below and levelling down from above, and although there were many very fine forwards most of them just missed greatness.

The Age of Levelling.—In the next 20 years before the World War there was more levelling up and levelling down; the first-class game had become so scientific that there were fewer and fewer opportunities for special distinction. To mention the names of the greatest players of this period would practically be to give a list of half the men in the teams of the Corinthians and the chief leagues. Already passing was becoming a fetish, and many forwards, finding themselves in such a position that they had the glorious opportunity to shoot, were afraid to take the responsibility, and passed to a comrade simply because they were anxious to get rid of the ball. But there were still men who, by reason of their personality or special skill, were able to stand out among their fellows.

After the World War.—During the World War men played football in the army in their intervals of rest, but naturally, not being able to get first-class practice, they fell off in skill, just as men did in cricket and all other games. Ever since then, all the great leagues have been straining every nerve, and spending large sums of money in trying to find satisfactory centre-forwards; but although every now and then the right man seemed to have been discovered, he usually fell off in his play after a few matches. It was the same with men in other positions; they sometimes did so well for a time that the greatest hopes were raised, but in a short time the hopes were disappointed; either they were injured or their great skill seemed to leave them. A tendency developed for every player, whether he was a back or half-back or a forward, to part with the ball at once, even if he was in a much better position than any of his comrades to go on with it himself. This resulted in much fascinating play in mid-field, but when the ball was near the goal these tactics were fated not to succeed. Heading the ball, which in the early days of the game was seldom practised, has become so general and produces so little

follow that they were outstanding players of their time. If, as in the case of Association football since the World War, the names of players are constantly changing, it is a certain sign of the absence of outstanding players. Everything since the war has tended to merge the individual in the team, and a list of the greatest players of the day would be a list of the men in the chief leagues in England, Scotland, Ireland and Wales. To differentiate between them is a task which even selection committees seem to find nearly hopeless.

THE FOOTBALL ASSOCIATION

Ever since its formation in 1863, the Football Association has shown a talent for organization. In 1905 it turned itself into a limited liability company, although no dividends may be paid to the shareholders nor may the directors be paid for their services, and has managed its affairs with an ability which would have done credit to any great company.

In its early days the Association was not without its struggles against adversity. Its rules were not generally adopted, and the newly formed Scottish Association would not allow the claim of the Football Association to be the lawmakers, and the Irish and Welsh associations insisted on certain rules of their own. Finally the Football Association, anxious to put the game on a perfectly sound basis, suggested that an International Board should be elected, consisting of two representatives each from England, Scotland, Ireland and Wales. This proposal was adopted in 1882, and there has been complete peace since then. After the legalization of professionalism, the Football Association settled down to its task of reorganizing the game, rendered necessary by the admission of professionals, and since then it has had no trouble except a few disagreements with the professional leagues, which were always increasing in power. Until 1886 Mr. C. W. Alcock was honorary secretary of the Football Association, and he was then made secretary. He retained the office until he retired in 1895, when he was succeeded by Mr. F. J. Wall, who had been honorary secretary of the Middlesex Association.

The Football Association Cup.—The competition for this trophy, which was once stolen and replaced, has been the cause of much enthusiastic rivalry. It began in a humble way in 1871, and the Scottish cup, instituted two years later, had many more entries for several years. In the first year of the Football Association cup, the Wanderers were the winners, and there were only 15 entries. Until the season 1882-83 the cup had always been won by a Southern club, but times were changing. Although professionalism was illegal, the amateur status of some of the Northern clubs was so questionable that gradually the best Southern clubs began to drop out. The cup was won in 1883 by the Blackburn Olympic club, and when two years later professionalism became legal, the big amateur clubs practically dropped out. With the formation of the Football League, the competition for the cup so rapidly increased that in 1888 it was divided into two parts: a qualifying competition and the competition proper. As the years went by even the matches in the qualifying competition attracted spectators from all parts of the district. The matches in which the chief league clubs were concerned filled the grounds to their utmost capacity, and when the final began to be played at the Crystal Palace, the spectators sometimes mustered about 120,000. By the time that the final tie was transferred to Wembley the enthusiasm of the public had increased so much that for the first match many thousands had to be turned away. The consequence was that the Association was compelled to take the hitherto unknown step of reserving the ground for the holders of special tickets, which have always been sold out long before the date of the match.

Success or failure means so much to the professional clubs that the actual players often become too much excited to be able to do themselves justice and "cup-tie" play has become a thing quite apart from play in ordinary matches. Often the cup has been won by a team which in league games could make no headway at all, but by sheer rush and boldness could force itself through the numerous, preliminary and grimly-fought rounds of the cup competition.

TRAPPING WITH INSIDE OF FOOT AND LEG (LEFT); TRAPPING WITH SOLE OF FOOT (CENTRE); HEADING WITH FRONT OF HEAD (RIGHT)

good result, that many footballers are beginning to think that it might be abolished. Even if a man has a hard skull it cannot be good for him constantly to meet a ball with his head, however hard it may be kicked or however heavy through wet. Nor can a man possibly know, when he heads a ball, exactly where it will go; and as likely as not it goes to an opponent.

A glance at the list of internationals will always show how a game stands at any period in regard to outstanding players. If the names of several men appear time after time it does not follow that they are great players, or even the best; but it does

The Cup Winners.—Up to 1928 the cup had been won six times by Aston Villa and Blackburn Rovers, five times by Wanderers (amateur), four times by Sheffield United, twice by Old Etonians (amateur), West Bromwich Albion, Bury, Sheffield Wednesday, Tottenham Hotspur, Wolverhampton Wanderers, Newcastle United and Bolton Wanderers, and once by Oxford University (amateur), Royal Engineers (amateur), Clapham Rovers (amateur), Old Carthusians (amateur), Blackburn Olympic, Preston North End, Notts County, Nottingham Forest, Manchester City, Everton, Manchester United, Bradford City, Barnsley, Burnley, Huddersfield Town and Cardiff City. Amateur clubs won the cup between 1872 and 1885, since then the winners have been professional clubs.

THE FOOTBALL LEAGUES

When, in 1888, Mr. William McGregor, known afterwards as the "Father of the League," wrote a letter to certain clubs suggesting that they should band themselves together and arrange to play out-and-home matches with each other, he cannot even have dreamed that the seed which he had sown would produce so prolific a crop. Twelve of the clubs agreed, formed themselves into the Football League, and for some years became a sort of close corporation. The success of the new league was so great that a second league was formed in 1892, consisting of 12 clubs, the number of the parent league being increased to 16. A southern league was formed which, after a chequered existence, asked in 1920 to be admitted to partnership as a third division, and in the following year a northern section of the third division was formed. In 1927 each of the four sections comprised 22 clubs. Various systems of promotion and relegation have been tried, with the result that in 1927 Blackburn Rovers, Aston Villa and Everton were the only clubs which had always kept their places in the first division. Frequent alterations have been made in the payment of players, in the arrangements for transferring them, and in the rules for the conduct of the leagues. In the early days of these organizations most of the teams included local players, but in the process of time the constant rearrangement of the teams resulting from transfers and importation, brought about many kaleidoscopic changes. Most of the leagues and other professional clubs have formed themselves into limited liability companies, but the directors are not paid, and the shareholders may not receive a larger dividend than 5%.

THE AMATEUR FOOTBALL ASSOCIATION

When a large number of the amateur clubs, including nearly all the old boys' clubs, seceded from the Football Association in 1907, they unwisely retained the old name with the addition of the word "amateur," thus beginning their new career by causing confusion. They instituted an Amateur Football Association cup on the lines of the already famous Football Association cup; but the Football Association promptly replied by taking a much greater interest in their own amateur cup. The result was that footballers at large refused to take the trouble to differentiate between the Amateur Football Association cup and the Football Association Amateur cup. The new association abolished the penalty kick, which most amateur players so much disliked; but very little headway was made; partly because the committee did not understand the use of advertisement, partly because there was no sort of punctuality in beginning the matches, and partly because the actual position was never properly realized. There seemed at first no reason why the new association should not become as powerful an organization as the Rugby Union, but the position of the two bodies was not the same. When the Rugby Union began its career its clubs were few, and the great players had to be discovered, whereas the A.F.A. had many clubs with the best players already well known. What happened was that the greater players, being all members of the Corinthian football club, had no strong opposition to meet, and they soon desired to meet the professionals again. In 1914 the Amateur Football Association and its clubs returned to the Football Association, but still retained its title and its own cup. Times had changed, and the separatists found that they were not on the old footing. Their best players

had been deteriorating, and the league clubs opposed to them were generally content to put reserve teams in the field against them. By slow degrees their players were eliminated from the International teams, and by 1927 these were practically confined to professionals. The Amateur Association also found that when public school after public school began to play Rugby, there was an always increasing difficulty in obtaining recruits for the universities and the old boys' clubs; and as, by the terms of readmission, they were not allowed to recruit from the amateur clubs already belonging to the Football Association, the teams became weaker every year. In 1927 an arrangement was made by which they might recruit from certain other clubs.

The Corinthians.—When the professional clubs had become so strong and their players so well trained that the untrained amateurs had no chance at all of beating them, the amateur clubs dropped out of the association cup. But there were some great players among the amateurs, and they very naturally regretted their want of opportunity to try their strength against professionals. In 1882 the idea occurred to N. L. Jackson, who was then honorary secretary of the London Association and assistant honorary secretary of the Football Association, that if a club was formed to include only the very best of the amateurs, it would not only enable the great amateur players to meet professional opponents, but would help towards combination in international matches. A meeting was convened at which the Corinthians came into being, and in the second year of the new club N. L. Jackson became its honorary secretary, an office which he held until 1898. The new club quickly became so popular that the professional clubs were glad to arrange matches with it. The result was interesting and scrupulously fair football; it became even a rare thing for the referee to blow his whistle—in many of the Corinthians' matches against the professionals the whistle would be heard no more than half a dozen times during the game, including the "kick-off," "half-time," and "time." So long as Jackson directed the fortunes of the club it flourished greatly, but when he retired it began slowly to lose ground. It had a great opportunity of reviving its former greatness when it seceded from the Football Association with the other amateur teams and joined the Amateur Football Association. If it had followed the example of the M.C.C. and had been content to be a missionary club, sending out well-chosen teams to all parts, and not caring overmuch whether victory or defeat was the result, the matches would have had an immense educational value. Unfortunately this method was not adopted, and the Corinthians gained a series of bloodless victories which were of no use to them or to anybody else. On the return of the amateurs to the Football Association, the Corinthians resumed their matches with the League clubs; but their glory had departed, and the leagues seldom put their strongest teams in the field. From the earliest days of the club the Corinthians had resolutely refused to enter for any competition, except for the Sheriff of London's shield; but apparently in hope of regaining their old supremacy, they entered for the Football Association cup in 1922. They were exempted from preliminary matches, but in 1927–28 results were not satisfactory.

Association Overseas.—At the beginning of the 20th century Association football was more or less confined to Great Britain and Ireland, but since then and more especially since the World War, it has made so great an advance abroad that it would be difficult to name a country where it is not played. It is becoming almost as popular in France, Holland, Belgium and Germany as it is in England. It is rapidly gaining a foothold in Spain, Portugal and Italy; it is making great progress in the United States, where it is already holding its own with baseball; it is popular in Canada, South Africa and Australia; it is played in Japan and Egypt; and the most remote outposts of the British empire have their clubs. There are associations and federations and leagues overseas, but in some of the countries the ideas of the authorities as to what constitutes an amateur are distinctly hazy.

UNITED STATES

Association football (soccer) of a kind has been played under varying conditions of popularity in the eastern United States since colonial days. Although at times it has been in danger of discontinuance because of lack of interest or greater interest in other games, it has shown a gradual increase in public favour. From a contest under limited and ill-defined rules with an irregular number of players on a side, played occasionally by towns-

PASSING WITH OUTSIDE OF FOOT (LEFT); PASSING WITH INSIDE OF FOOT (CENTRE); TRAPPING WITH THE BODY (RIGHT)

people or school boys, soccer has developed into a definite and well-codified game with a place among the leading sports of the eastern States. Other parts of the country have been slower but no less sure in recognizing its merits. It is estimated in 1928 that 75,000 individuals played soccer in the United States. A great number of these were Europeans employed by industrial companies and professional leagues or immigrants who played soccer previous to emigrating. Strenuous efforts are being made to increase the popularity of soccer among the native youth of America.

With the exception of a brief period in the '50s and '60s, before Rugby was developed, soccer had not been generally regarded in the United States as a school and college game until about 1920. Its increased use by colleges and schools, however, is enhancing its popularity among non-scholastic and non-collegiate groups, particularly among city leagues, industrial leagues, composed largely of foreign-born players and occasional teams.

Collegiate Soccer.—As early as 1830 a sort of football was played between the classes in Harvard college, and by 1844 football was being played in a number of American colleges. It varied in different institutions and, strictly speaking, was neither Association football nor Rugby. In general characteristics it was closely related to the former, however, and in fact developed in a logical fashion into the Association game. During the '40s and '50s everything concerning the game was excessively informal. There was no definite number of players, no special uniform was worn by the players, any available space relatively flat and open was utilized as a field, and the ball consisted of rubber or cloth, or perhaps a pig or beef bladder in its natural state or inserted within a covering. Rules were practically non-existent. By 1860 a dozen colleges along the Atlantic seaboard were playing Association football regularly (no inter-collegiate contests as yet) and the game had become somewhat uniform in its standards of play. On Nov. 6, 1869, the first inter-collegiate contest was played at New Brunswick between Rutgers college and Princeton college. It was essentially Association football. Stimulated by this introduction of inter-collegiate matches, the game was popular for the following six or eight years. Each of the colleges, Princeton, Rutgers, Columbia, Yale, University of Pennsylvania, Harvard, Haverford, Stevens, New York university and the College of the City of New York, as opportunity afforded, arranged one or more inter-

collegiate games unless prohibited—as Yale and Harvard were in 1871. For each contest a compromise was necessary, since each college had its own code of play. Delays were frequent. About 1874 Harvard began to favour the Rugby game. Other colleges soon did likewise, and by 1877–78 Rugby football, which was fast making strides toward the modern brand of the American game, replaced Association football as the official fall sport.

Association football did not entirely disappear from college campuses before the gains of its rival, Rugby, but the years 1877–1905 were a lean period for the game. During 1904–05 interest was revived and enough inter-collegiate matches were played in the spring to decide a championship. In 1914 the season was changed to autumn, as originally. For most of the academic year, however, the game is found on the campus, an extended period that gives opportunity to develop native players. There is a larger percentage of foreign students on soccer teams than on teams in any other sport. Since the World War a growing number of institutions have adopted soccer. Experienced ex-players have not been obtainable for coaching in sufficient numbers, with the result that many of the college teams—even occasionally successful teams—are being coached by men who know the game chiefly from a theoretical standpoint. Consequently soccer in the colleges generally is not played with the same finesse as in Europe.

It is significant, however, that an increasing number of colleges and universities are giving soccer a permanent place on their intra-mural and inter-collegiate programmes from year to year. The quality of playing is improving quite naturally as boys who have learned the game in secondary schools enter the colleges. In 1926 32 or more institutions played inter-collegiate soccer matches with four to eight games on a schedule, making a total of approximately 150 contests. In addition these institutions and some 30 others play intra-mural matches. The number playing at any one institution ranges from 15 at a very small college where the sport is new to 750 at a large university like that of Pennsylvania or Ohio State. Slight changes and adaptations of the rules by colleges (the use of substitutes, four quarter-periods, goal judges, offside rule, providing two defenders instead of three) are not looked upon with favour by non-collegiate officials. Association football is also being adapted for women at a few colleges and universities.

In general, Association football among colleges in the United States is strongest in the East, making fair headway in the Middle West and on the Pacific coast, and being introduced in the South. While at the University of Pennsylvania and Dartmouth college it has been given the standing of a "major" sport, at most institutions it remains in the "minor" sports class. Until this handicap is removed, soccer can not come fully into its own as a college game.

Non-collegiate Soccer.—Practically all soccer associations, clubs, leagues and competitions in the United States whether amateur or professional are affiliated with and controlled by the U.S. Football Association, Inc. This association, which also regulates international competition through its affiliation with the Federation Internationale de Football Association, was incorporated April 5, 1913, as an outgrowth of the revived interest in soccer in America, the need for international affiliation, and the progress of the game during the previous decade. Prominent among the regional associations which had already existed was the American Football Association, organized in 1884 and reorganized in 1906. The U.S.F.A. sponsors the organization of city, county, and district leagues and State associations the country over. Approximately 20 State associations have been organized and more than 1,000 clubs are playing. A large proportion of these are in and around centres with a prominent foreign-born population. The association stimulates competition through the National Challenge Cup Competition which it has conducted annually since 1913. Entries are permitted from all clubs under the jurisdiction of the association either by direct or indirect affiliation. In the 1926–27 contest, 124 teams participated. Total attendance at these matches has reached as high as 172,000 in one year. Rounds commence as early as October and extend to the grand finals in late spring. Since 1922–23 an amateur cup competition has also been conducted by the association. In 1926–27 57 teams entered. Ger

public interest which has been relatively small is increasing.

Professional soccer in the United States began in 1918 with the organization of the Bethlehem team. Practically all the players were Europeans. Since that time the same practice has been followed, so that few of the men playing on professional teams are native Americans. The professional organizations are privately owned but controlled by the U.S.F.A. Approximately 215 of the 2,000 registered players are employed by the American Soccer League comprising 10 leading teams in the East.

In public and private high schools soccer is notably popular in a few sections and is gaining acceptance consistently in many others. In New York city and Philadelphia schools the game is officially encouraged. Rugby is prohibited in State high schools of Maryland while soccer has been made a "major" sport in that State. The Playground Athletic League in Baltimore has had as many as 372 teams playing in one season. In the District of Columbia Municipal League the numbers participating doubled from 1925-26 to 1926-27. At the tournament held by the University of Pennsylvania 12 teams competed. In Michigan, and more particularly in Detroit, soccer among boys of school age is popular. Eighteen schools competed in the Tulsa (Oklahoma) league. Chicago, St. Louis, Cleveland and other large cities are sponsoring soccer among school boys. Over a great portion of the country, however, the game has not been introduced or has not as yet gained foothold.

FOOTBALL, RUGBY. From the first there were two distinct camps among football players—those who preferred to use only their feet, and those who used both hands and feet—and, for some reason which no one seems to know, the Rugby school game gained more adherents than any other among those who favoured the handling of the ball. A Rugby boy named William Webb Ellis is said to have been the first player to catch the ball and run with it, thus originating the distinctive feature of the Rugby game. This was in 1823; but it was not until the '60s that the game began to be taken seriously by clubs. Two of the first to do so were Blackheath, in 1862, and Richmond, in 1863. In the next few years many more new clubs sprang into existence, including the Oxford university club, in 1869, and the Cambridge university club, in 1872, in which year matches between the two universities were begun. In Jan. 1871, 17 clubs and three schools met and formed a governing body under the title of the Rugby Union. From this time the two games of Rugby and Association football went their separate ways, and were rendered the more distinctive by the fact that the Rugby players used an oval ball and the Association players a round one.

THE GAME IN ITS INFANCY

The Early Scrummages.—In both character and methods the Rugby game has changed more completely from its original form than any other game. In its earliest days the methods of play were based almost entirely on the traditions of the game at Rugby school, with its Bigside matches, in which anything from 40 to 100 or more players took part. Similar matches became popular in other schools, but it was customary in ordinary matches to play 20 a side. Though the players of the time seem to have enjoyed the game immensely, it was undoubtedly a rough and tumble affair, with many features which would have prevented its development without drastic modifications. It consisted mainly of fierce scrummaging, in which the bulk of the players would be locked and wedged together, in a heaving mass, sometimes for ten minutes or more at a time, struggling and kicking for a ball which most of them could not see. Often these scrummages would be continued long after a player outside the scrum had run off with the ball; or sometimes the ball would eventually be found lying perfectly still a yard or so away. But one great principle animated the players—that it was immaterial if, in kicking for the ball, they kicked their opponents' shins.

Hacking and Mauling.—From accidental kicking of this kind it was a natural step to intentional kicking, or hacking as it was called, and a player who could not give and take hacks was not considered worth his salt. Hacking developed into a deliberate means of forcing a way through the opposition; and kicking the shins of a player when running—known as "hacking over"—became a recognized feature of the play. An old Rugbeian, the

FIELD OF PLAY IN RUGBY FOOTBALL, SHOWING DIVISIONS AND GOALS

late A. G. Guillemard, who assisted in the foundation of the Rugby Union, related how he once saw the crack "hack" of the Woolwich Academy team, then noted for its fierce forward play, come through the scrummage and finish off his triumphal progress by kicking a half-back clean off his legs. Another curious feature of the game at that time and for many years afterwards was the maul-in-goal. This occurred when a player with the ball was tackled over the goal line. The tackler and the tackled player would then engage in a sort of private wrestling match for possession of the ball, while the rest of the players in both teams became merely interested spectators. It was not uncommon to see the two men lying on the ground, locked in deadly grips, motionless sometimes for several minutes until one of them gave a sudden heave, which might only alter their positions a little. On the initiative of the Richmond club, most other clubs in the London area abandoned hacking by mutual consent after 1866, and when the Rugby Union drew up its first laws in 1871, the practice was made illegal.

THE GAME ESTABLISHED

Fifteen a Side.—The new laws did much towards improving the general tone of the game, but the dawn of the modern game really broke with the general reduction in the number of players from 20 a side to 15 a side. The universities first adopted the change in 1875, and in the following year it was introduced into international matches. From that time the game became more and more open and interesting in character, players began to

realize the value of team work, and new methods developed rapidly. Instead of pushing blindly in the scrummages, standing upright to form the tighter mass, forwards began to push with their heads down so that they could see the ball, and to develop skill in controlling it and breaking away with it. Forwards were no longer chosen entirely for their weight and strength, but also for their ability to dribble the ball and to combine in concerted tactics.

Wheeling and Heeling Out.—Of these tactics wheeling or screwing the scrum, so as the better to start a concerted rush, became a prominent feature. Some of the old players were frankly disgusted at this manoeuvre. For instance, Mr. Arthur Budd, a great forward of his day, wrote contemptuously of "a forest of legs scraping for possession of the ball," and characterized the proceeding as "extremely unfair." Nevertheless wheeling became recognized as a skilful and effective part of the game, and there was no more thrilling sight than a pack of well-trained forwards wheeling the scrum and breaking away with the ball in a rush. Dribbling developed into a high art, and it was wonderful to see men like the brothers E. T. and C. Gurdon, of the Richmond club, two of the greatest forwards of their day, break away with the ball at their feet and steer it past opponent after opponent.

When the practice of heeling the ball out of the scrum came to the backs first appeared, it met with just as severe condemnation from old players as wheeling had done. Mr. Budd referred to it as a "canker-worm of work," and wrote in the Rev. F. Marshall's classical book on the game: "You can bet your bottom dollar that a team who habitually heel-out are no pushers. Their sole anxiety is to get the ball to their half-backs, and the same miserable scraping goes on as in wheeling." Mr. Budd's indignation may be the better understood when it is remembered that at one time it was regarded as exceedingly bad form, almost unfair in fact, to heel the ball out of a scrum even if the players were in such a position that a certain score would have resulted from it. But other times, other manners. To-day Mr. Budd's "miserable scraping" for the ball is recognized as a highly specialized job, known as hooking and a clever hooker is invaluable.

Developments in Back Play.—New forward tactics brought with them new methods among the backs. Hitherto their functions had been chiefly those of defence, and for many years it was customary to play two half-backs behind the scrum, one three-quarter behind them, and two or three full-backs. To pass the ball was practically unknown, and regarded as a sign of "funk" in any player who attempted to do so. When one of the backs happened to secure the ball he either kicked it or tucked it under his arm and ran and dodged until he was brought down and forcibly compelled to part with it. With the development of more open play by the forwards, the backs found themselves with more work to do and fewer opportunities for individual efforts. The activities of the half-backs in particular became more and more hampered by the opposing forwards, and the position of three-quarter-back became of increasing importance. It was soon found an advantage to play two three-quarters instead of one, and one of the full-backs was accordingly transferred to that position.

The Inception of Passing.—Although the backs handled the ball more than the forwards, it was, curiously enough, among the forwards that hand to hand passing first developed to any extent. The Blackheath club gave special attention to short passing by the forwards and achieved such success by it that public interest was aroused, and other players quickly followed their example. But it was left to the most famous of all university captains, H. Vassall, to show the real possibilities of passing among forwards. The Vassall era at Oxford was one of the outstanding periods of the game. Himself a fine forward, he trained his men not only to exploit the short passing game, but to give and take long passes, and to combine in rapid team work. The results took most of their opponents by surprise, and in four seasons, from 1881, the Oxford team suffered only two defeats—both at the hands of Edinburgh university. In the season 1882–83 the side scored 28 goals and 26 tries, and had only a goal and

two tries scored against them. Apart from their success in the development of new methods, the Oxford teams of that period contained some exceptionally talented players, and among them was Alan Rotherham, who proceeded to revolutionize half-back play just as Vassall had revolutionized forward play. It is claimed that passing by the half-backs had already been started in Scotland, but Rotherham was the first to demonstrate its great possibilities. He made the half-back a connecting link between the forwards and the three-quarters, and showed the possibility of a wide variation of tactics. He demonstrated the great advantage of getting the three-quarters on the move before passing, and also of making openings for them, and it is not too much to say that on the methods he introduced, half-back play has ever since been modelled. At about the same time as Rotherham was thus gaining fame, there appeared in the Bradford club team a player named Rawson Robertshaw, who extended Rotherham's methods still further by developing passing among the three-quarter-backs. One of three brothers whose name became a household word in Yorkshire, he showed genius as a three-quarter. By that time the practice of playing three three-quarters, instead of two, had been generally adopted, and at centre three-quarter Robertshaw introduced passing to the outside men, and developed combined work with it in a way that gave players an entirely new conception of a three-quarter line as an attacking force. It was but a short step to the introduction of another player into the three-quarter line, with the idea of making it more effective, but curiously enough it was left to Welsh clubs to demonstrate its advantages before the three-quarters were universally increased to four players. Indeed, some years elapsed before the Welshmen were able to perfect the four three-quarter game so as to show its real effectiveness. Opinion in the other countries held out against it for some time on the ground that it meant weakening the forwards who were thereby reduced from nine to eight players.

LATER DEVELOPMENTS

The Orthodox Formation.—There have been a few isolated variations in the formation of the players since then, but the orthodox arrangement of a fifteen has remained unaltered—that is, eight forwards, two half-backs, four three-quarter-backs and one full-back. In New Zealand a formation consisting of seven forwards, two half-backs, two five-eighth-backs, three three-quarters, and a full-back was adopted, and visiting teams from the Dominion have shown remarkable skill in making use of the extra back. A few clubs in England and Ireland followed their example, but have never been able to show definite superiority as a result; for it has been clearly demonstrated that seven forwards must be exceptionally good to hold their own against eight; and without that condition the extra back is generally useful only in defence. Though the scrum is not the dominating feature of the game that it used to be, the balance of power still remains with the forwards, and modern developments have chiefly centred in them. A forward is expected to be able to take his share in practically every phase of the game, and without a doubt his is the most exacting work on the field. Of real scrummaging, as it was known to the old players, there is very little to be seen; but in their anxiety to obtain possession of the ball the forwards have had recourse to all sorts of manoeuvres of which their forbears never dreamed. The normal formation of the eight forwards in a scrum is in three rows—three players in the front, two in the second row, and three at the back. The front three forwards on each side pack down shoulder against shoulder, with their heads tucked down so that they can see the ball as it is thrown between them by the scrum half-back. The middle man in each front row is the hooker, who endeavours to sweep the ball back with his foot through the legs of those behind him. Now it is obvious that when three men pack down in this way against another three, one of the outside men on each side will have a disengaged shoulder, and that the middle men will not be directly opposite to each other. The half-back who puts the ball in will naturally choose, if possible, to put it in on that side of the scrum on which his own forward has the disengaged shoulder, since the middle man will then be a little

nearer than his opposite number, and will thus have the first chance of hooking the ball—the outside men being debarred from doing so.

Wing Forwards.—One forward development which has had a large influence on the game all round is what is known as wing forward play. This concerns mainly the back row players in the scrummage. Briefly, it means that these players must break

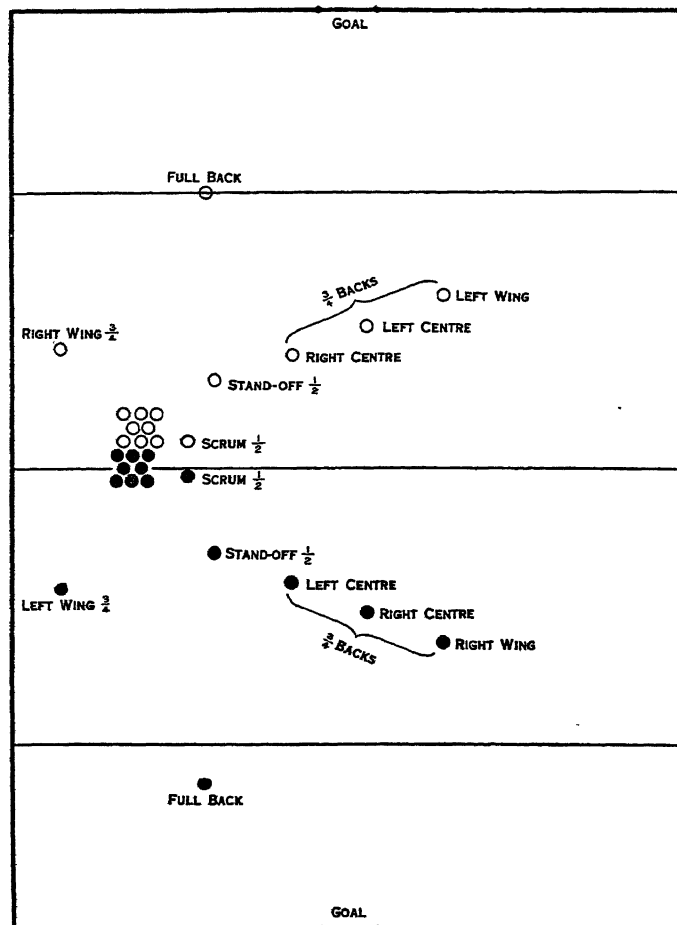

DIAGRAM SHOWING PLAYERS IN THE FIELD IN POSITION FOR A SCRUMMAGE

very quickly from the scrummage and, if their opponents get the ball, rush on the opposing backs to nip any possible attack in the bud; if their own side get the ball they are expected to follow up to support the backs in passing. In most teams players are now specially chosen as wing forwards for their ability to break away quickly, and at the right moment, and for their instinct to see at once where they are likely to be of most use in open play. The New Zealand team which visited Great Britain in 1905 demonstrated the possibilities of wing forward play. Their captain, David Gallagher, used as a rule to take no part in the scrummage, but stood outside it, ready to go in any direction as the ball was gained or lost by his forwards. Though the idea and principles of wing forward play were then entirely unknown in England, Gallagher prophesied that they would soon become established. At first, like previous developments, the wing forward was anathematized as a curse to the game, but he has now been accepted as an inevitable consequence of the general tendency towards speeding up the play.

THE LAWS

Until the formation of the Rugby Union in 1871 the Rugby school laws of the game were the only ones in existence, and they were so complicated that teams generally compromised and made rules of their own, so that when they played each other it was necessary for the captains to meet and agree as to how they should play. Even when the Rugby Union drew up a revised code

of laws they were not properly understood by players for some time, and though many modifications and alterations have since been made, complete uniformity in interpretation has so far never been attained. The Rugby Union produced an entire re-draft of the laws in 1926, but the new form did very little to simplify them.

The Field of Play.—A plan is here given showing the dimensions of the field of play and the method of marking it out; and though it looks complicated, it is really very simple. The ten yards line, for instance, concerns only the kick-off from the middle of the field, which takes place at the beginning of the game and after every score. The ball must be kicked as far as or beyond the ten yards line, and none of the opposing side may advance over that line until the ball has been kicked. The 25 yards line similarly has very little to do with the play, except when the ball has been made dead behind the goal line other than by means of a score. The defending side may then take a drop kick from any point behind the 25 yards line, and the opponents may not advance over the line. The broken line marked five yards inside each touch line was introduced in 1926 in connection with an alteration in the laws providing that when the ball goes over the touch line it must be thrown in at least five yards. The goal line is the most important line on the field, since a try may be scored anywhere in the area between it and the dead ball line. The ball is in play in this area until a player touches it on the ground with his hand, or it is kicked over the dead ball line or the touch-in-goal lines. On most big grounds the dead ball line is marked at the maximum distance of 25 yards behind the goal line, but it varies on some grounds which are not large enough to permit of the maximum distance being used. There is no recognized height for the goal posts and they are found of various heights on different grounds. When the United Services Rugby team was formed, and Lord Fisher, then First Lord of the Admiralty, was appealed to for support he is said to have replied, "Certainly; and the United Services shall have the tallest goal posts in England"—and he at once sent out an order for them to Portsmouth Dockyard. It is an advantage to have the tallest possible posts, for as the ball may be kicked at any height over the cross-bar to score a goal, it is often difficult to judge a kick if the posts are short.

Points in the Game.—Though the play in detail is frequently very complicated, the game can be followed easily if one or two of the chief features are understood. Two of the cardinal principles are that a player may never pass forward, and that, with certain reservations, he may take no part in the play while he is in front of the ball when it is being kicked or carried by one of his own side. These rules sound simple enough, but in practice the second of them, which relates to off-side, is complicated by various provisions and conditions. The enforcement of both rules depends solely on the opinion of the referee. In most of the other rules of Rugby the referee has only to deal with plain questions of fact. For certain deliberate infringements or unfair play, he may award a penalty kick to the opposing side; otherwise the game is resumed after an infringement by means of a set scrummage, the ball being put into the scrummage by the half-back on the non-offending side. A player may be tackled only when in actual possession of the ball, and must then play the ball; he is considered to have been tackled only when he is so held that there is a moment when he cannot pass or play the ball.

Kicking.—There are three distinct methods of kicking the Rugby ball—the place kick, the drop kick, and the punt. The place kick is a simple kick at the ball after it has been placed on the ground for the purpose. It is used in kicking at goal after a try, and is generally employed in attempts to score from penalty kicks. The drop kick is made by letting the ball fall from the hands to the ground and kicking it almost simultaneously, actually just as it is rising. A goal may be scored by the use of a drop kick from any part of the field during the play, and a drop is frequently used for penalty and free kicks. The punt, or kick at the ball before it touches the ground, is used chiefly for kicking into touch. There was once a time when a deliberate kick into touch met with howls of derision from spectators, but it has

RUGBY IN ENGLAND: SCENES AT TWICKENHAM AND RICHMOND

1. Good break away by English forward, at Twickenham. In English Rugby the standard formation makes use of four three-quarter-backs, one full-back, two half-backs, and eight forwards to each side
2. Scottish player held up by English opponents: Calcutta Cup, at Twickenham
3. Getting the ball away: the Inter-Hospital Cup, Richmond
4. W. W. Wakefield, the English international, well tackled in the

Middlesex Seven-a-side Tournament. Seven-a-side tournaments have been played in Scotland also for many years, and are regarded chiefly as a "curtain" to the Rugby season

5. Clearing from a "scrum" (scrummage): Army vs. Royal Air Force, at Twickenham. (The picture shows A. T. Young, the English international scrum-half-back, passing the ball out)

come to be one of the most applauded features of the Rugby game.

Scoring.—Many changes have been made from time to time in the methods of scoring in the Rugby game, but the goal kicked from a try has always been supreme. At one time a match could not be won unless a goal was scored, no matter how many tries had been gained, since the basic significance of a try was that the side which obtained it had the privilege of "trying for a goal." The first change came in 1875, when it was ruled that if neither side had an advantage in goals, a match should be decided by a majority of tries. This was still unsatisfactory, for one goal would still beat any number of tries. In 1886 a system of scoring by points was introduced, and three tries were made equal to a goal. Five years later another change was made, two points being awarded for a try, and five for a goal; and in 1905 the present system was adopted, with scoring values as follows: A try—3 points; a goal from a try (in which case the try does not count)—5 points; a dropped goal, other than from a free kick or penalty kick—4 points; a goal from a penalty kick—3 points; a goal from a "mark"—3 points. The "mark" is the only occasion when a free kick, as distinct from a penalty kick, is given. It may be claimed by any player who makes a fair catch either direct from an opponent's kick, or when the ball is knocked forward—or thrown forward by an opponent.

THE GREAT PLAYERS

So many changes have taken place in the methods of play in the Rugby game that opinions are bound to differ widely as to the comparative merits of players who gained fame in their day. Some of the older players shone perhaps with a special glamour because they were pioneers of new methods, and the players of one generation will nearly always champion their particular stars against all others. All that can be done in this article is to indicate some of the most outstanding players of their times.

Full-Backs.—By general consent two of the best full-backs the game has ever seen were H. B. Tristram and H. T. Gamlin. It is impossible to compare them in any way, for Tristram played in the days when there were only three three-quarters, while Gamlin did not appear until four three-quarters were played and the game had changed a great deal. Both were particularly noted for their deadly tackling, and Tristram is still remembered for the way in which he saved the game for England in 1887 by stopping the Herculean rush of W. E. MacLagan, the greatest Scottish three-quarter-back of that time, on the goal line. Some of the old full-backs were wonderfully long kickers, and among those who excelled in this way were F. J. Byrne, who played for England in the middle '90s, and W. J. Bancroft, the most famous of Welsh full-backs, who played in 33 international matches from 1890. Bancroft was a particularly fine drop kicker and an extremely clever player in every way. One of the very safest of full-backs was A. R. Smith, who played for Scotland from 1895 to 1900, and was an unusually fast runner. Among more modern full-backs W. R. Johnston, who played 16 times for England between 1910 and 1914, was undoubtedly a great back, who was hardly ever known to misfield the ball, even in its most greasy state. Since the war three fine full-backs have appeared in B. S. Cumberlege (England) who always inspired the players in front of him with complete confidence in everything he did; W. E. Crawford (Ireland), a player of unsurpassed brilliance in his day but not so consistent as Cumberlege; and D. S. Drysdale (Scotland), a clever player with very safe methods.

Three-quarter-backs.—Among the earliest three-quarter-backs when the game became organized, Lennard Stokes, a younger brother of F. Stokes, the first English captain, was both a great player and an outstanding personality in the game. He began playing when teams had only one three-quarter and he saw the increase to two three-quarters, and then to three. W. E. MacLagan, who made an equally great name in Scottish Rugby at that time, was tremendously strong and his tackling was a terror to opponents. Mr. R. W. Irvine, who captained the Scottish team in his time, wrote "I would rather fall into the hands of any

back in the three Kingdoms than into those of MacLagan." But the foremost attacking three-quarter of the '80s was undoubtedly A. E. Stoddart, the great cricketer. Possessed of great speed, he had an extraordinary faculty for running through his opponents, who would seem hypnotized. While Stoddart was playing for England, Wales produced A. J. Gould, whose daring agility and versatility earned for him the soubriquet of "monkey"; and hard on his heels came E. Gwyn Nicholls, perhaps the most famous of Welsh three-quarters. At that time the four three-quarter system had not long been adopted, and Nicholls was largely instrumental by his play at centre three-quarter in bringing it to a perfection that will long be remembered in Welsh Rugby. He was a player with a born instinct for making openings for his colleagues, and always seemed to do things a little quicker than any other player. Between 1896 and 1906 Nicholls played in 24 international matches. J. E. Raphael, who played for England from 1902-06, was a three-quarter who always kept his opponents wondering what he would do, for he had an instinct for making the best use of an opening and had a swooping, dodgy run which made him very difficult to tackle. J. G. Birkett was another outstanding personality in English Rugby for many years in the early part of this century, and opponents always held him in great respect, for he had a fine physique, of which he knew how to make the best use in running and tackling. Scotland had a player of conspicuous all-round ability in K. G. MacLeod, and Ireland in Basil Maclear. But the player who was most prominent for several years before the World War was R. W. Poulton-Palmer. He was a great tactician and often won matches by daring strategy. C. N. Lowe has been perhaps the most remarkable three-quarter since the World War, though he began playing for England in 1913. He must have been the lightest wing three-quarter in history for he never weighed more than 108 lb. but he was very compactly built and could bring down much bigger players than himself because he timed his tackles so perfectly. He was a very elusive runner with a natural instinct for position. As a complete line the Scottish International three-quarters of 1924-25, I. S. Smith, G. P. S. Macpherson, A. I. Aitken, and A. C. Wallace, who all played for Oxford, stand out for their clever combination.

Half-Backs.—The half-backs may well be considered in pairs, for although several players have shone individually, it is in partnerships that most of them have become famous. Scotland and England had two remarkable pairs at about the same time in the '80s in A. G. Grant-Asher and A. R. Don Wauchope (Scotland) and Alan Rotherham and H. T. Twynam. Wales has had two outstanding pairs in the brothers D. and E. James, who were extremely nippy, and were very clever in passing; and R. M. Owen and W. J. Trew, with Owen a master-hand at evolving surprise tactics. Before them W. H. Gwynn was noted as the most scientific half-back of his day, and after them there was T. H. Vile, a diminutive but brainy player, who improved on many of Owen's methods. Irishmen still think that Louis Magee, whose international career extended from 1895 to 1904, was the greatest half-back Ireland has ever had; but R. A. Lloyd, who played from 1910 to 1920, was a very good second. P. Munro, of Scotland, and A. D. Stoop made a great pair in the Harlequin team a few years before the war. Stoop created new methods which revolutionized English half-back play, and had much to do with a revival of England's fortunes in international matches from 1910, when he first appeared. But there can be no question that W. J. A. Davies and C. A. Kershaw, who came together in the navy and England teams after the war, were players worthy to be compared with any of their predecessors. With a lithe, compact physique, Davies always had the quickness of genius in seizing his chances, and was a most elusive runner. When he had the ball no one knew what he might do, and he would sometimes drop a goal from an apparently impossible position. Kershaw, a strongly-built player, was not only able to give a much longer and swifter pass out from the scrum than most other players, which helped Davies enormously, but he was a player of brilliant originality.

Forwards.—Fifty years ago, when forward play was more largely a matter of weight and strength than it is to-day, there

were some terrific men in the game. The two brothers E. T. and C. Gurdon, who stood out among English forwards for many years, were very muscular men, C. Gurdon in particular having enormous strength. C. Reid, reckoned the "champion forward" of Scotland at about the same time, was another giant with great tackling powers, and J. W. Taylor, a great Irish forward, was of similar type; while there was no better example of the solid forwards of the '80s than C. J. B. Marriott, who afterwards became known to every Rugby player as the secretary of the Rugby Union. In the '90s S. M. J. Woods and F. Mitchell were among the greatest forwards as well as the greatest cricketers of their time, as also was J. Daniell in the early part of the present century. No one could inspire and control a pack of forwards better than he did. Among later forwards C. H. Pillman, who played for England from 1910 to 1914, earned distinction for the skill with which he developed wing forward play. L. G. Brown, a very solidly-built player, who appeared for England both before and after the war, was a great leader as well as a player of conspicuous skill and judgment. W. W. Wakefield has been easily the most outstanding forward since the war, both for his skill as a player and his genius as a leader. Very sturdily built, he is a fine scrummager, but very fast in the open, and no player knows better than he how to put his full weight and strength into a rush for the goal line. W. F. Browne is another exceptionally sturdy and fast forward who has been dominant in Irish Rugby in the last few years. Among the players who have gained special distinction as wing forwards, H. L. Price has shown perhaps the truest instinct for the position, but A. T. Voyce has rivalled him very closely.

THE FOUR RUGBY UNIONS

How They Were Founded.—When the Rugby Union was formed in 1871 it received the support of both English and Scottish clubs, but the Scottish clubs had already become strong enough to challenge England to play an international match, which took place in Edinburgh in March 1871. Soon afterwards the Scottish clubs decided to form a ruling body of their own, and the Scottish Rugby Union was founded in 1873. Meanwhile the game had been making substantial headway in both Ireland and Wales, and Irish clubs began to make a move towards establishing a separate governing body. The southern clubs put the idea into shape by forming the Irish Football Union in 1874, but the northern clubs resented their action and formed a rival North of Ireland Union in 1875. It was not until 1881 that they became reconciled, and founded the Irish Rugby Union. The Welsh Rugby Union grew out of the South Wales Union, which was dissolved to give place to it in 1880.

Disputes.—The code of laws drawn up by the Rugby Union was at first accepted by all the other unions, but in 1884 the Scottish Union disputed the validity of a try scored by England in the international match on a point of law, and as the two unions, after long correspondence, could not reach an agreement, Scotland declined to play England in the following year, 1885. Scotland challenged the right of the Rugby Union to be the sole interpreters of the laws, and when in 1886 the Rugby Union proposed to alter the method of scoring, disaffection spread to the other unions, who as a consequence withdrew from playing matches against England during the season 1887-88. A proposal was then made that the laws for international matches should be framed by an international board composed of an equal number of representatives from each union. The Rugby Union had agreed to the formation of such a board to settle disputes only, but, as the parent body in the game, it could not agree to join the board on a basis of equal representation if it was to make the laws. Eventually the Rugby Union offered to submit the matter to arbitration, and the other unions agreed. The arbitrators were Lord Kingsburgh and Major Marindin who met in April 1890 and decided for the formation of an international board to control the laws and settle disputes in connection with international matches, with six representatives from England, and two each from Scotland, Ireland, and Wales. Except that the Rugby Union's representation has been reduced to four members, the board has continued on the same basis ever since.

The Fight Against Professionalism.—No sooner had the international difficulties been settled than the Rugby Union began to be seriously perturbed by the increase in the number of cases of professionalism which came to its notice. These emanated principally from the north, where the game had taken a hold among players of the working class, many of whom were being secretly compensated for time which, through playing, they lost at work. In 1893 the matter came to a head at the general meeting of the Rugby Union, when the Yorkshire representatives put forward a motion "That players be allowed compensation for *bonâ fide* loss of time." The meeting was historic. The amateur forces in the game rallied strongly to the support of the union, and the motion was defeated by 282 votes to 136. But the evil was only partially checked, and in order to quash it decisively the Rugby Union drew up a comprehensive code of laws as to professionalism which closed practically every loophole by which a player might receive any financial benefit from playing. As a result, a number of clubs in the north resigned from the union, and formed the "Northern Football Union" which, at first admitting only payment for broken time, soon sanctioned outright professionalism. In course of time the Northern Union adopted a different form of the game, with 13 players instead of 15, and a few years ago its name was changed to the "Rugby League."

International and County Matches.—Though England and Scotland were the first to begin playing international matches in 1871, Ireland very soon joined them, playing its first match against England in 1875, and against Scotland in 1877. Wales began to play matches against England in 1881, against Ireland in 1882, and against Scotland in 1883. In 1879 the Calcutta club, which had joined the Rugby Union four or five years previously, presented a handsome silver cup, known as the Calcutta cup, to be competed for annually by England and Scotland. Though several other minor cup competitions exist among the clubs, the four unions have always discouraged them, as inimical to the best interests of the game.

County matches began to be played by Yorkshire and Lancashire teams in 1870. Other counties soon joined in, and in 1890 the Rugby Union approved a system of grouping for a recognized championship competition.

RUGBY OVERSEAS

France.—The Rugby game appears to have been started in France in the '70s, but for some years progress was very slow. It began to make more headway in the '90s, and had become firmly enough established by the beginning of the present century for France to enter into international matches, which were begun against England in 1906, against Wales in 1908, against Ireland in 1909, and against Scotland in 1910. After the World War the game developed probably more rapidly in France than in any other country, and clubs sprang up all over the republic. This is the more remarkable since French players, coming little into contact with clubs and players in Great Britain, had more or less to work out their own salvation in the game. For years their ideas of scrummaging, in particular, were crude, and the first French teams in international matches suffered a series of most disheartening defeats. In later years the play of French teams improved all round. Among the clubs there has grown up an intense rivalry. So far a real genius has yet to arise among French players, but some very good players have appeared, perhaps the most outstanding being A. Cassayet, a fine forward, who played in 32 international matches from 1920 to 1927, and A. Jaurréguy, who has been a conspicuous wing three-quarter during the same period.

New Zealand.—The first Rugby match in New Zealand is reputed to have taken place at Auckland in the early '70s. The game made an instant appeal to football players, and in a few years it had become established in both the North and South Islands. It is regarded as the national game in New Zealand, and nowhere has more study been given to methods of play. As early as 1888 a team composed principally of Maoris visited Great Britain and beat many of the leading clubs; and when, in 1905, the first representative New Zealand side came over, it

proved ahead of British teams, both in methods and skill, and won all its matches except one against Wales. Its captain, D. Gallagher, was the first to demonstrate the possibilities of wing forward play, and the general combination and cleverness of the whole team came as an eye-opener to British players. Nineteen years later, in 1924, the second New Zealand team arrived in Great Britain and had an even greater triumph than the first, winning all its matches. Again it proved ahead of British players in skill and tactics. Its chief secrets of success were its versatility in exploiting varying forms of attack, and an intensive system of backing up, which scarcely ever left a loop-hole for a serious mistake. But the team was also notable for a number of outstanding personalities among its players. G. Nepia was an exceptionally sound full back, strong in physique, a fearless tackler, and very safe in fielding and kicking. In M. Nicholls and A. E. Cooke, as five-eighths backs, the tactics of the side largely centred, and both were unusually gifted players; while M. Brownlie and J. Richardson were outstanding among the forwards, both for their size and skill. In 1926 a Maori team visited France and Great Britain, and beat several of the strongest clubs, but it was naturally not so strong as the representative side.

South Africa.—The Rugby game developed more slowly in South Africa than in New Zealand. It appears to have grown up side by side with the Association game; and a hybrid form of football, embodying features of both games, was also played. Largely as a missionary enterprise, to encourage the Rugby game, the Rugby Union sent a team to South Africa in 1891, and though the side won all its matches the South African players showed considerable skill. Two more teams visited the country, in 1896 and 1903, before the first South African team came to Great Britain in 1906. In this team the brilliance of the backs came as a revelation to most players. They had an exceptionally clever three-quarter line in J. D. Krige, H. A. De Villiers, A. Stegmann, and J. Loubser; and in A. F. Marsburg, a great full-back. The forward play was not so well developed in South Africa at that time, but it improved vastly in the next few years, and when in 1912 another team came over to Great Britain the position was reversed, the forwards proving the strongest part of the side. But the team had in G. P. Morkel another full-back worthy to rank with the great players, and in D. F. T. Morkel a forward with extraordinary skill as a place kicker.

The Australian Game.—In Australia the Rugby game has always centred chiefly in New South Wales, while in Victoria an entirely distinct game became popular. Like Rugby, this is played with an oval ball, but there the resemblance ends. The game is played on an oval field 180yd. long at its greatest length and 120yd. at its greatest width. At each end there are goal posts, 7yd. apart, but without a cross-bar; in addition there are posts, called "behind posts," at 7yd. distance on either side of the goal. A goal, counting six points, is scored when the ball is kicked at any height, without being touched, between the goal posts. A "behind," worth one point, is scored if the ball passes between the "behind posts" or is touched before passing between the goal posts. The teams are of 18 a side and they are scattered over the whole field in pairs, each man of one side marking an opponent, as in lacrosse. The ball may not be passed with the hands but must be kicked or punched, and a player may not run with it more than 10yd. without bouncing it. The entire absence of off-side avoids many of the complications of Rugby or Association; on the other hand there are constant halts for other reasons, when free kicks are given, though these are usually taken so quickly that the play is scarcely stopped. A particularly interesting feature of the game is the play of one man, who is called the rover. This player has no recognized position, but goes where he likes according to his judgment.

Australian Rugby Team.—Two teams of Australian Rugby players have visited Great Britain, the first in 1908 and the second in 1927. The first was not an outstanding side, but the 1927 team, composed of New South Wales players, captained by A. C. Wallace, an old Oxford Blue and Scottish International, and including A. T. Lawton, another Oxford Blue, soon became popular. It had not so many outstanding personalities as the New Zealand

side of 1924, nor were its methods as versatile and enterprising as those of the New Zealanders; but it trained into a thoroughly good all-round combination.

Other Countries.—In many other parts of the world Rugby football has made strides in recent years, and is now played in practically every British colony where the conditions are at all suitable. In Canada and the United States its followers, comparatively, have never been very numerous. This is due to the popularity of American Rugby, a derivative from English Rugby, and also to the popularity of "soccer," which likewise is a derivative from an English predecessor. In South America interest in Rugby has shown a marked increase, particularly in the Argentine republic, which was visited in 1927 by a team organized by the Rugby Union under the captaincy of D. J. McMyn, the Scottish international. The side was of fair strength and won all its matches, but the Argentine players, showed quick appreciation of what they could learn from the tour, which gave a great fillip to the game in the republic.

SCHOOL GAMES

The Eton Wall Game.—Though both the Rugby and Association games are played during certain periods at Eton, the college has retained as its chief forms of football two entirely distinct games, called the Wall game and the Field game. The Wall game owed its origin to the presence of a high wall enclosing part of the college grounds along the road from Windsor to Slough. The area of play comprises a strip of ground running along this wall. At each end there is an area known as "calx" equivalent to the area behind the goal line in Rugby. One end is called "good calx" and the other "bad calx," and goals are marked at the back of each calx. The teams are of 11 a side. Five players on each side form down against the wall in a bully, or scrummage; the remaining players take up positions outside the bully. The ball is put into the bully at the start of the game and whenever it goes out of the area of play; and the object is to work it along the wall with the feet into the calx. When the ball has been forced into calx, the attacking side strive to gain a "shy," which is accomplished by a player lifting the ball with his foot against the wall, and touching it there. This achieved, the ball may then be "shied" at goal. In scoring, a goal outweighs any number of "shies."

The Eton Field Game.—In the Field game the usual number of players is 11 a side, though more are sometimes included. The game is played in a large field with goals at each end, similar to the goals in the Association game but smaller in size. The chief features of the play are the bully, resembling an attenuated scrummage in Rugby; dribbling by the forwards, who form the bulk of the team; and long and accurate kicking by the "behinds" or backs. A goal may be scored either by an ordinary shot or by forcing a "rouge." The "rouge" is closely allied to the try in Rugby and is scored by an attacking player touching the ball down behind the goal line. The ball is then brought out in front of the goal, a bully formed, and the attackers endeavour to force it through. A goal counts three points, and a rouge from which no goal is scored one point.

The Harrow Game.—The Harrow game is comparatively simple in principle and play. It consists mainly of dribbling by the forwards and long kicking by the backs. Two posts are set up at each end of the ground without a cross bar, and a goal, or "base" as it is called, is scored when the ball passes between them at any height. The ball may not be handled, but it may be caught from a kick, when the catcher may either kick it or drop it and begin dribbling it. A cardinal principle of the game is that players must keep behind the ball; otherwise they are off-side except in certain contingencies, much the same as in Rugby. The great art in the play is to be able to keep the ball close under control in dribbling. Usually teams are of 11 a side, but the number of players may vary according to circumstances.

The Winchester Game.—The Winchester game is played on a much smaller area than either Rugby or Association, the dimensions being about 80yd. by 25yd. There are no goal posts, a goal being scored whenever the ball crosses the end lines. This is not as easy of accomplishment as it would appear, for one of the

rules is that the ball may not be kicked more than 5 ft. high, unless it comes rolling or bounding towards a player direct from an opponent. The number of players varies, but in the chief matches there are six a side. The main feature of the play is the "hot," which is somewhat like an old-time scrummage in Rugby. This takes place at the beginning of the game or whenever the ball goes out of play. Dribbling forms no part of the game, and almost the sole business of the backs is to kick hard and straight. A player is off-side if he is in front of the ball, and passing is illegal. In spite of the small area of play the game is very exacting and calls for great speed and quickness.

AMERICAN RUGBY

This, as its name imports, is a derivative from the game invented and played at Rugby, in England, but passing through the rules of the Rugby Football Union. To understand properly its position relatively in the sports of America one must be slightly acquainted with the formative period in American football which preceded the adoption of the Rugby game.

Princeton and Rutgers, on Nov. 23, 1869, played the first intercollegiate football game in history, Rutgers winning by 6 goals to 4. The rules of the game were specially drafted, and followed generally the rules of the London Football Association, then as now, known as "Association" or "Soccer." Football at that time, as an organized sport, was not played at any of the other colleges in America. In 1870 Columbia joined Princeton and Rutgers as an opponent. In 1872 came Yale, with a specially devised game of its own but based nevertheless on the Association code. In 1874 McGill university, of Canada, introduced Rugby to the United States by scheduling and playing, May 14, in that year, a game with Harvard which resulted in a draw, 0 to 0. In the following year, Harvard invited Yale to play under the Rugby rules. Yale accepted but exacted certain concessions in the Rugby code from which the rules of the game as played were designated as the "Concessionary Rules." Princeton brought order out of chaos in 1876 by organizing an intercollegiate convention which was held at Springfield, Mass., on Nov. 23. This convention was attended by representatives of Columbia, Harvard, Princeton and Yale. The convention on that date organized the colleges represented into the American Intercollegiate Football Association. It adopted the rules of the Rugby Football Union of England as their common playing code; and scheduled a mutual set of games.

The genius of young America for invention, however, appeared in that original convention and made one radical change in the English code. The Rugby players of England for many years had determined victory in their games by a majority of goals, the touchdown ("try") being only an incident in play which entitled a team to a try for a goal. The American collegians of 1876 modified this custom by changing Rule 8, in the code of that day, to read as follows:

"A match shall be decided by a majority of touchdowns; a goal shall be equal to four touchdowns; but in case of a tie, a goal kicked from a touchdown shall take precedence over four touchdowns."

The adoption of this basic change in Rugby football started a movement in the American game that has become one of the features of the sport, namely, the annual changing of the rules. In every year since 1876, excepting three, important changes have been introduced, and probably only the abeyance of the sport during the World War prevented the football authorities from making additional innovations in two of those years.

On the whole the result of this vast body of changes has been to create a distinctive American game, featured by the presence of sustained, swift and intense action, skilful and varied performances, and by the brilliant, predominating characteristic of strategy and tactics.

This game has become the most popular of the collegiate sports. It has been adopted and is played by approximately 400 college

teams and by about 3,000 school teams. The games of this great army of players annually attract approximately ten million spectators. To accommodate this great and growing attendance the leaders in the sport have erected gigantic amphitheatres, stadia and bowls, seating, respectively from 25,000 to 100,000. The annual income from this sport in a single university has exceeded \$1,000,000 in one year. The game also is evolving among professional organizations and is being adopted by progressive cities as a part of their educational or playground systems.

Playing Field.—The game is played upon a rectangular field, 360 ft. in length and 160 ft. in width. This field is marked with lines of lime. It is divided into sections known as the field of play and end zones. The field of play, 100 yd. in length, is divided into 20 spaces, each 5 yd. in width, also marked with heavy transverse lines of lime, thus giving to the field of play a resemblance to a great gridiron, hence the origin of the grid-iron as a familiar name of the field. At each end of the field is one of the end zones, 10 yd. in length. The lines indicating the sides of this huge field are known as side lines. The lines at the end of the field of play are called goal lines, and the rear boundaries of the end zones are designated as end lines. In the centre of the end lines are erected goals. These consist of posts of wood or metal, at least 20 ft. in height, 18 ft. and 6 in. in width, connected by a cross bar 10 ft. above the ground.

FIG. 1.—DIAGRAM OF FIELD OF PLAY IN RUGBY FOOTBALL, GIVING MEASUREMENTS

Number of Players.—Eleven players constitute a side or team. This number is Etonian and not Rugbeian. It was copied from the Eton game and introduced into the American game in 1880. These players are divided into two sections, a line of seven men, known as the rush-line, or line of forwards and a group of four men known as the back-field or backs. The line-men and the positions which they occupy are named as follows: Left-end, Left-tackle, Left-guard, Centre, Right-guard, Right-tackle and Right-end. As arrayed on offence in the order named, they present technically a balanced line because in the arrangement three men are arrayed on each side of the centre as below.

FIG. 2.—BALANCED LINE AND BALANCED BACKFIELD FORMATION
E, end; T, tackle; G, guard; C, centre; Q, quarter-back; H, half-back; F, full-back

FIG. 3.—UNBALANCED LINE AND UNBALANCED BACKFIELD FORMATION. QUARTER-BACK BEHIND CENTRE

There are, however, many derivative line arrangements. Whenever more than three players are arrayed on the same side of the centre, as in fig. 3, the alignment is known as unbalanced line.

The backs, likewise, take their names from the positions they occupy in primary back-field grouping, namely, quarter-back, left half-back, right half-back and full-back. When these backs are so arrayed that the quarter-back and the full-back are in a straight line behind the centre with a half-back on each side of the full-back, they are said to be in a balanced formation (see fig. 2). When they are not thus evenly behind the centre they are said

PLAYS FROM UNIVERSITY GAMES IN THE UNITED STATES

1. General view of the field and grandstand at the Navy-Notre Dame game, 1927, at Baltimore, Maryland. The photograph, taken immediately before the game opened, shows the teams in their respective positions for the kick-off
2. The Army-Navy game, 1927, Polo Grounds, New York City. Murell of the Army making the kick-off. The Army eleven in line, in tense playing position, ready to follow the ball
3. The Army-Navy game, 1925, Polo Grounds, New York City, played before 70,000 spectators. Banks of the Navy is shown in early part of game, plunging through the line for a gain of 23 yds.
4. Washington and Jefferson versus Lafayette, 1925, Polo Grounds, New York City. Millman, right half-back for Lafayette, is shown running the ball around left end for a 9 yd. gain
5. Princeton-Yale game, 1925, at the Yale Bowl, New Haven, witnessed by 78,000 spectators. Allen of Yale throwing forward pass to Kline, which made possible a touch-down for Yale
6. Princeton-Harvard game, 1926, at Cambridge. Caulkins, Princeton quarter-back, is shown going around left end, after a triple pass, for the only touch-down of the entire game

to be in an unbalanced formation (*see* fig. 3).

Objective.—The object of the game, concisely stated, for the offence, that is the side in possession of the ball, is to advance the ball, if possible, by a player carrying it forward in his arms, a method styled the running attack; or by throwing the ball forward to be caught by a player of the same side, an advance known as a forward-pass attack; or by kicking the ball forward, an assault styled the kicking attack. If the ball is carried across an opponent's goal line it constitutes a touchdown and counts 6 points. If it is thrown across and caught by a player of the same side it also is a touchdown and counts 6 points. The ball is kicked in three different technical ways. The first of these, the punt, is commonly employed to advance the ball. It is executed by dropping the ball from the hand and kicking it with the foot before the ball touches the ground. Such a kick cannot score. Scoring by kicking, known as kicking a goal from the field, is accomplished by the use of a drop kick or a place kick. A drop kick is a ball dropped from the hand or hands to the ground and kicked the instant it arises from the ground. A place kick is a ball kicked from a position of rest upon the ground. A goal from the field counts 3 points. A third method of scoring occurs, when opponents are in possession of the ball, so close to their own goal line that to extricate themselves the ball, either by accident or design, is sent across their own goal line and there touched down by one of them—a play known as a safety. This play credits two points to the score of their adversaries. The scoring of a touchdown not only counts 6 points but permits the scoring side to try for an additional score of one point. This they attempt to accomplish by putting the ball in play at any point selected by them, provided it is 2 yd. distant from the goal line, and in a single play either scoring another touchdown by carrying or passing the ball across their opponent's goal line or by kicking a goal from the field. This manoeuvre is known technically as a try-for-point, or, popularly, as an extra point.

The defence, that is the side not in possession of the ball, concisely stated, endeavours to prevent its opponents from carrying the ball forward by tackling the carrier. To make a tackle a player of the defence wraps his arms around the carrier and throws him to the ground. Similarly, the defence strives to prevent the ball from being passed forward and caught by the opponents by intercepting and catching the ball themselves, a performance technically known as an intercepted pass or by batting or otherwise forcing the ball to the ground.

When the side in possession of the ball essays to kick it, the opponents endeavour to prevent the kick by seizing the kicker before he can get his kick off, or by blocking the kick, which is achieved by a player interposing his body against the ball while the latter is starting in flight. If the kick is blocked a great effort ensues by all the players of both sides to capture the ball. If, however, the kick is executed and the ball goes up the field another manoeuvre is imminent, running back the kick. The player of the receiving side attempts to catch the ball cleanly and if successful immediately bursts into a run back up the field towards his opponent's goal.

Officials.—On account of the volume, variety and complexity of action in the American game an unusually large force of officials is required to conduct it. These consist of a referee, an umpire, a linesman and a field judge. The linesman also may select two assistant linesmen. The referee has general oversight and control of the game. He exercises a general supervision over the ball, is sole authority for the score and forfeiture of the game under the rules. He supervises the proper putting of the ball in play, its position and progress. The umpire is judge of the conduct and position of the players, and assists the referee in decisions involving possession of the ball. The linesman, under the supervision of the referee, marks the distances gained or lost in the progress of play. His assistants operate on the side-lines two rods about 6 ft. in length connected at their lower ends by a stout cord or chain, 10 yd. in length, for the purpose of marking conspicuously certain distances involved in play. The field judge acts as assistant to the other officials under the jurisdiction of the referee and supervises the time.

The length of the game is 60 minutes divided into four playing periods of 15 minutes each, exclusive of time taken out for delays. There is an intermission of one minute between the first and second periods; 15 minutes between the second and third; and one minute between the third and fourth. The highest score determines victory.

Kick-off.—The game opens with a formal play called the kick-off (*see* Plate IV., fig. 1). Prior thereto the referee calls the two opposing captains together and directs one of them to "call the toss" of a coin. If he wins the toss he has the choice of goals, or of kicking off, or of receiving the kick-off. The loser of the toss has the choice of the options which the winner does not select. These selections having been completed, the side in possession of the ball puts it down on its own 40 yd. line for the kick-off. The side in possession of the ball deploys along its 40 yd. line, as in fig. 4, for the purpose of running down the field under the kick, and keeping apace with the ball and prevent, if possible, its opponents from catching the ball and carrying it back. The side receiving the kick spreads over its territory (*see* fig. 5) so as to be able to make a clean catch of the ball, wherever it may come, and thereupon either to run it back or to kick it back.

FIG. 4.—OFFENSIVE FORMATION ON THE KICK-OFF

FIG. 5.—FORMATION TO RECEIVE THE KICK-OFF

Experience and study have designed a number of ingenious kick receiving formations. For the most common one *see* fig. 5.

When the players of both sides are in position the referee blows his whistle to commence play. A player trained to kick off the ball kicks it high in the air up the field. The game is then in motion.

Orderly Possession of Ball.—The rules provide for the orderly possession of the ball by one side, with the right to put the ball in play, and barring a fumble, to execute the ensuing play. A fumble is the accidental dropping of the ball from the hands or arms of the carrier. A player of either side may recover and retain a fumbled ball. As the rules allow great freedom of action in the grouping of players in the methods of handling the ball, in advancing it, or of preventing an advance by opponents, there arises out of this rule relative to orderly possession another basic distinction of American Rugby, pre-arranged formations, tactics, plays and strategy. The right to put the ball in play by a team is designated as a down. Ordinarily a team upon obtaining the ball possesses the right to make four attempts to advance it a total distance of 10 yards. Each of these attempts constitutes a down. If in these four attempts or any part thereof this distance of 10 yd. is gained, the down instantly becomes a first down and the right is renewed to advance another 10 yd. in a similar series of four attempts. If in four consecutive downs a team fails to advance the ball 10 yd., the ball goes to opponents on the spot of the last down. The forward line is the line of scrimmage.

Offensive Formation.—An offensive formation is the tactical grouping of the players for the purpose of making an advance. Games frequently involve a series of preliminary formations. The

FIG. 6.—UNBALANCED BACKFIELD FORMATION BEHIND BALANCED LINE. HALF-BACKS BEHIND TACKLE

FIG. 7.—UNBALANCED LINE AND UNBALANCED BACKFIELD FORMATION. QUARTER-BACK OUTSIDE END

basic formation of the offence is the balanced formation, as shown in fig. 2. From this formation every point of the defensive terrain may be attacked.

In 1893 the tandem arrangement of the backs was invented, now called the unbalanced back-field formation. It was imposed, however, in 1893 behind a balanced line, as in fig. 6. This arrange-

ment was followed later by the introduction of the unbalanced line, thus giving to football its long used formation of the unbalanced backs behind the unbalanced line. (See fig. 3.) This formation commonly is made by arraying two of the backs in a tandem or straight line behind one of the tackles with the full-back about 4 yd. directly behind the centre and with the quarter-back kneeling or standing immediately behind the centre.

This formation generally known as the tandem formation frequently is varied, as in fig. 7, by moving the quarter-back to the outside of the offensive end on the long side of the line, about 1 yd. behind the line.

From these two basic formations the football tacticians of America have evolved ingeniously many other offensive formations upon each of which they have erected elaborate systems of attacks technically known as plays. In one of these formations, frequently employed, three of the backs are arrayed in a line oblique to the line of scrimmage with the fourth-back occasionally to the outside of the oblique formation. (See fig. 8.) In another formation (see fig. 9), likewise selected as a type because of its distinct variance and popular use, a back is stationed 1 yd. outside and 1 yd. behind each one of the offensive ends, a third-back directly behind one of the guards and the fourth-back behind the centre. The first three backs mentioned are about 2 yd. behind the line, the fourth-back is about $3\frac{1}{2}$ yd. from the line.

FIG. 8.—UNBALANCED LINE. BACKS IN OBLIQUE TANDEM

FIG. 9.—BALANCED LINE. BACKS IN SPREAD

Another basic formation in the tactics of the game is the kick formation shown in fig. 10, a formation specially designed to protect the kicker from interference while kicking the ball, and also highly useful as a basis for launching a varied attack. This formation is made by stationing the kicker, usually the full-back, or any other player selected because of his kicking skill, about 8 to 10 yd. directly behind the centre with two backs in front of him on the side of his kicking foot, with the other back on the opposite side. Since this kick formation is highly adapted for the execution of a kick, a run or a pass, it is known as a triple threat formation. This also applies to any of its derivatives. The player dropped back to kick, if also able to run or to pass, is known as a triple threat man. The foregoing formations present only prominent examples of this department of tactics. There are many other arrangements of the backs, particularly special formations designed not as the basis of a general attack but for special assaults. Two of the most useful and most used special formations are the spread formation and the line divide.

Preparatory to a spread play the line divides into two or more sections and deploys in as many groups widely across the field on the line of scrimmage. The backs also separate into two or more groups and likewise widely deploy across the field, shown as above.

FIG. 10.—KICK FORMATION

FIG. 11.—SPREAD FORMATION

The object of these tactics is to compel the defence also to spread widely and therefore, through the inability of the defence adequately to cover all of their territory with only 11 men, to expose themselves to an attack in an uncovered zone. As a spread formation is well suited for the launching of a run, a pass or a kick, the defence, if it concentrates to meet one of these forms of attack exposes itself to an assault by means of one of the other two arms of offence. A second special offensive formation fre-

quently employed is the split line, shown in fig. 12, or as it is also called, the line divide. This in reality is a modified spread play. In it the line is divided by sending an end well out on the line of scrimmage, known as an End Out Formation, or by making a second wide space between the end and the tackle, known as a double

FIG. 12.—A LINE DIVIDE

divide. The object of the line divide or split line is to force the defence to spread to cover the points thus widely threatened.

The Forward Pass Attack.—The forward pass system of attack is a highly complicated and very ingeniously organized department of offensive play. On any play which starts with a scrimmage the offence is permitted to throw the ball forward provided the pass is made from a point 5 yd. behind the line. The pass may be caught only by players on the end of the line of scrimmage or who were 1 yd. behind the line when the ball was put in play. These are known as "eligible men." If one of these eligible men catches the pass, the pass is said to be a complete pass, and the receiver if not tackled at the spot where he catches the ball may run with it for a farther advance. If the ball strikes the ground it is called an incomplete pass. Such a pass counts as a down but goes back to the point from which it was played. Any player of the defensive team may intercept in the air the forward pass of opponents by catching and retaining the ball. Upon such an interception the player who catches the ball may advance it toward his opponent's goal. A great many manoeuvres are designed for the purpose of executing forward passes. These manoeuvres involve feints and delays in order to delude the defence and to give the "eligible men" time to get down the field to receive the pass.

The Kicking Attack.—If a team fails to make the necessary gain of 10 yd. in the four trials, or downs, they are required, as previously stated, to deliver the ball to their opponents on the spot of the last down. Customarily, a team perceiving that it will not make the 10 yd. in the four downs abandons the running attack before these downs are exhausted and turns to a kicking attack, thus delivering the ball to the opponents at a greater distance from the former's goal-line, since a kick of the ball on the final down will send it ordinarily from 35 to 65 yd. deeper into the opponent's territory. If, however, the offence is within kicking distance of their opponents' goal when they elect to kick they will not punt the ball but will endeavour to score a goal from the field by kicking the ball, either by a drop kick or a place kick, over their opponents' cross bar.

Plays.—A "play" is any manoeuvre, either offensive or defensive. On offence the plays are based upon the formations, that is to say, the team first assumes a tactical formation. From this formation a play may be launched or the team may shift into a secondary formation, the first formation having been assumed merely to mislead the defence. General formations are so designed that various points not only may be attacked from one and the same formation but in order that these points may be attacked in different ways. These plays combine many movements on the part of the players, all of which are carefully worked out in detail by the coaches, rehearsed many times by the players and when finally perfected assigned a number by which they are known and controlled. Theoretically, in every play the 11 players of the offence must be so disposed and utilized that each one of the 11 players of the defence will be prevented from stopping the attack. This involves charging the line-men back, making an opening in the line, boxing or pocketing the ends, blocking off the line-men and defensive backs, and in many other ways aiding the carrier of the ball. These latter men separately are called "interferers," and, collectively, "the interference."

Whenever an attack momentarily advances the ball the defence for that portion of time has been thus completely covered, and

whenever a score is achieved it has been achieved because each player of the offensive side has discharged perfectly his assignment. To aid in thwarting the defence many methods are employed. Plays are organized by concentrating the players of the offence so ingeniously and powerfully that the play moves forward by sheer might. These are known as power plays. Again, craft is employed to weaken the defence. The attack employs feint movements in which a certain point is conspicuously threatened while the real attack strikes elsewhere. At times the interference goes in one direction and the carrier in another; at other times, the interference divides into two sections. These manoeuvres are known as split interference. Delivery of the ball is feinted, delayed and concealed to add to the confusion of the defence; or the carrier on receiving the ball will hand it secretly to another player. All of these features are so well differentiated that they have come to be known technically by certain names. Plays usually take their popular names from the point and manner attacked. Thus the sport presents plays familiarly known as end runs, off-tackle slants, centre plunges, cross-bucks, line-bucks, concealed, delayed, double and triple passes, end-around, cut-backs, lobs, flat passes, flying wedges, man-in-motion, wasted man, pivots, whirls, race plays, reverses, lateral and multiple passes, splits, spreads, hidden ball and trick plays.

While this list indicates the existence of a great many plays a team seldom carries more than 30 plays in its equipment, and many of these are duplicates, that is, the same play but designed to strike right or left in the same manner. Experience has proved that it is not a large variety of equipment that makes a team powerful but perfection of execution of an adequate number of plays.

The number of plays possible under any formation is limited only by the ingenuity of the generals of the game. To illustrate this distinctive and fascinating feature of American Rugby two plays will be selected as types and explained. The first of these is a wide run around the right end. In this illustration the unbalanced formation as in fig. 3 will be employed. The quarter-back gives the secret signal for this particular play. With the snap of the ball into action the 11 men in the formation leap forward to discharge their particular parts in the execution of the manoeuvre, according to the following diagram:

The tackles, guards and centre charge initially forward. The right-end attempts to turn his opponent in, so that the play can sweep around behind him. The full-back and quarter-back run out to help the right-end turn the flank. The left half-back receiving the ball follows close behind them. The left-tackle and the right-guard, having initially charged their opponents, likewise join the interference in the turning movement. The left-end dashes behind the opponent's line and endeavours to cut down a secondary defender. If each opponent is successfully blocked, the left half-back with the ball sweeps around the right-end in a wide-end run.

For a second illustration of a play a cross-buck will be selected and the balanced formation (see fig. 2) will be employed. The following is a diagram of the execution of this play:

With the snap of the ball into action the offensive line charges sharply forward, the right-guard and right-tackle charging slightly obliquely as the opening is to be made between them. The quarter-back and full-back leap with tremendous force against the point to be attacked, in order to aid in forcing the opening. The right-half simultaneously blocks off the defensive left-end. The left-tackle runs behind the opponents' line to cut down a secondary.

FIG. 13.—WIDE END RUN TO THE RIGHT FROM UNBALANCED FORMATION

FIG. 14.—CROSS BUCK FROM BALANCED FORMATION

The left-end does likewise, or as indicated in the diagram follows after the play to retrieve a fumbled ball. The ball in this play is passed directly to the left half-back who plunges across from left to right and strikes between his right-guard and right-tackle.

Defence.—The defensive systems in American Rugby are as highly involved but more standardized than those pertaining to the offence. The rules, by design, provide for a game in which the offence will have a slight preponderance of strength. The object of this provision is to prevent drawn games. It is accomplished by making the zones of attacks, so far as rules are concerned, larger than the defence can cover. In other words, 11 men are inadequate to cover their entire territory on defence. Some one spot must be exposed to attack. If the defence, however, is strong enough, swift enough and skilful enough, they can overcome this handicap by mobilizing their players, or some of them, at the threatened point. Therein largely originates the brilliance of defensive football.

The basic principle of line defence is 7 men on the line to withstand the offensive assault of the 7 offensive forwards. The defensive players, however, are differently placed. Usually the centre and the two guards face their opponents. The defensive tackle plays slightly to the outside of his tackle. There are two systems of deploying an end on the defence. The most common one finds the end stationed about 4 yd. distant from his tackle. This is known as the wide-end defence. The other defence, known as the close-end defence, finds the end by the side of his tackle. The spaces of these defensive line-men vary on different teams according to the system employed. On some teams the spaces between the different players on the line are even, on the others the largest spaces are between tackle and end and the next larger between tackle and guard. The variation as to the ends on defence not only covers their position but also extends to their use. Some systems require the end to charge through and plunge headlong into the adversary's interference for the purpose of breaking it up and forcing the runner into the open. This is called the smashing end defence. Other systems require the end to charge through but to hold the interference off with straight arms, thus remaining upon his feet but checking the interference and forcing the runner out. A third system requires the end to stand in his position on the line and wait until the interference comes to him. This is known as the waiting end defence. In this system the obligation is upon the tackle to get through and break the interference. Another variation in line defence is the use of the centre. In some junctures in the game described later under the title "Strategy," the centre plays in the line. At other junctures he drops behind the line as a support thus leaving only six men on the line.

The use of the backs on defence presents a variety of systems. The most common of these today is the so-called "box defence," in which 7 players stand upon the line, 2 backs known as tackle supports or wing backs each about 4 yds. behind his tackle, and the 2 remaining backs about 8 yd. behind them, the 4 backs thus forming a square or box as in fig. 15. This style of defence is the most powerful defence against a running attack, but is weak as a defence to forward passes and also ignores kicks

FIG. 15.—BOX DEFENCE, 7—2—2

FIG. 16.—A—7—3—1 DEFENCE

entirely. As the rule regulating on side play prevents members of the kicking side who are in front of the ball when it is kicked from recovering it, automatically the ball when it comes to rest must go to the defensive team. The theory of the box defence, therefore, is that unable adequately to defend the entire field they take a chance on overhead forward passes and allow the kick of their opponents to go as far as it will. Other systems of defence, however, which endeavour to cover the entire field as far as possible, are formed as in fig. 16 by placing one of the backs in the deep back field to catch kicks, the other three being

deployed about 10 yd. behind the line, 2 as wing-backs and 1 as a centre defence. When a centre is withdrawn from the line an opportunity for three different defensive formations is possible; one with 6 men on the line, 2 in a secondary line, 2 in the third line, thus forming the box, with a fifth back in deep field to cover kicks and to tackle a runner who gets by the other lines of defence. (See fig. 17.) The back in the deep back field is called a safety man. Such a defence among football men is technically known as a "6-2-2-1 defence."

If three backs are played in secondary line and two on the third line of defence, as in fig. 18, it is known as a "6-3-2 defence."

FIG. 17.—A-6-2-2-1 DEFENCE

FIG. 18.—A-6-3-2 DEFENCE

Signal System.—An additional basic feature distinctive of American Rugby is the elaborate signal system by which its manoeuvres, formations, tactics and plays are controlled.

Coaching.—On account of the vast knowledge and the skill required to play the various positions in football as well as to amalgamate all of the players into a team functioning in unison with precision and accuracy, an elaborate system of coaching is required in the American Rugby game. Therefore, football establishments endeavour to have a staff consisting of a head coach and assistant coaches. The assistant coaches are specialists, men who are particularly skilled in coaching certain positions or in coaching some special department of play or they may be skilled in strategy and tactics. These assistant coaches are assigned to their speciality by the head coach who is charged with the general preparation of the players and the team, and its supervision during a game.

Strategy, or generalship, is the general policy of directing the play of a team. This depends upon many considerations. First of all it depends upon the detailed character of the play of opponents as shown in previous games or as developed in the game being played. The first attacks directed against a team in a game are for the purpose of advancing the ball, of course, but they also are designed to find the strong and the weak spots in the defensive establishment, either in their methods or in their individual players. The field general, usually the quarter-back, therefore, studies the system of lining up of his opponents. He notes the spaces between the line-men, the distance from the tackles assumed by the ends, the position assumed by the tackles and the system of defensive play of the centre. Particularly he notes the disposition of the defensive backs, whether they are employing the box defence and thereby exposing their deep back-field. He carefully watches the positions assumed by the wing-backs, and notes scrupulously the assumption by the defence of a 7-2-2, 7-3-1, a 7-2-1-1, a 6-3-2 or a 6-2-2-1 system.

The general plan of conducting a game also requires taking advantage of the wind when this blows with substantial force directly or diagonally upon the back of a team. Such an aid brings into action frequently a vigorous kicking attack since the wind enables one full-back to out-kick the other and thereby gain ground without drawing upon the energies of the team for a running attack until a striking position is achieved. Between his own 30 yd. line and the opponents' 30 yd. line, the strength of all points in the defensive line are tried out, and various general methods of attack are employed. Within this zone, it is orthodox to essay difficult and hazardous plays, criss-crosses, triple passes, field reverses, forward passes and trick plays. If the field general finds he can advance, he selects for use his long gaining plays for the purpose of quickly approaching within scoring distance of his opponents' goal. Within this zone a wise field general invariably kicks on his third down unless he is behind in the score and with only inches to gain on a final desperate thrust. If play forces a team behind its own 25 yd. line, the field general abandons the general attack. In this zone he either kicks on first

down or calls for one long gaining play and, if it fails, kicks on the second down. No play involving the possible loss of the ball is prudently attempted within this zone. As the advance crosses the 25 yd. line the quarter-back changes his offensive policy. Here he employs a general attack but between the 25 yd. line and the 50 yd. line he kicks on the third down. If he successfully leads his army across his opponents' 25 yd. line, he again changes his general plan of play. He calls for plays that he previously has found can make headway. As he crosses his adversary's 10 yd. line he should not employ plays which attack the centre of his adversary's line. The proximity of the goal-line behind his opponents has enabled them to abandon largely their back-field defence and bring up their backs to support the line and carefully to guard the centre. Owing to the danger of a touch-back the quarter-back does not signal for a forward pass on second or third down.

If the offence is employing an unbalanced line and the defence does not realine or shift to match the distribution of strength the quarter-back abandons an attack towards his short side. If, however, the defence realines or shifts so as to match man with man he will frequently send attacks on his weakest side. If he sees that the defensive ends are playing unusually close to their tackles, he directs his plays to their outside. When the ends move in to fill this gap the quarter-back changes his attack and out-flanks them. If the defensive centre is behind his line the attack is directed against the centre. With the centre behind the line, it is more difficult to complete a forward pass. With the centre in line and only 4 men left to cover the extensive back field a forward pass can be used. With the offence in the situation of a second or third down with only a yard to go, the defence is in a predicament. If the centre plays in the line he exposes his back-field to a pass; if he plays behind his line he exposes the line to a running attack. Offensively, therefore, the quarter-back in such a juncture selects his play according to the position assumed by the defensive centre.

The foregoing presentation of American Rugby constitutes a brief review of the basic structure of the sport, its tactics and strategy.

GLOSSARY OF IMPORTANT FOOTBALL TERMS

Attack, Running.—Plays in which the carrier of the ball attempts to advance it by running.

Balanced Backs.—Arrangement of the backs in which one back stands directly behind the centre with a back on each side of him.

Balanced Line.—Arrangement of the line in which the seven forwards array in a regular line of end, tackle, guard, centre, guard, tackle, end, or any other alinement in which three forwards stand on each side of the centre.

Balanced Formation.—An offensive grouping of the 11 players in which seven men array along the line, three on each side of centre with the quarter-back behind the centre, the full-back behind the quarter and one half-back on each side of, and equidistant from the full back.

Block.—The checking of the movements of a player by another player through interposition of the latter's body.

Box Defence.—A defensive system in which seven men stand on the line, with two backs about 5 yd. distant behind the tackles and with the two remaining backs standing about 5 yd. behind the two backs on the second line, the four backs thus forming a box. In this system no back plays in the deep back-field for safety or to cover kicks.

Close Formation.—The grouping of the players of a side in a compact arrangement.

Close Line.—Arraying the line men in a straight compact line.

Cross Checking.—The diagonal charge by a player in the line, not against his opposite opponent but against an adjacent opponent.

Defence 7-2-2.—A defensive system which deploys seven on the line, two in the secondary line and two on the tertiary line.

Defence 7-3-1.—A defensive system which deploys seven men on the first line, three on the secondary line and one on the tertiary line.

Defence 6-3-2.—A defensive system which deploys six men on the first line, three on the secondary line and two on the tertiary line.

Defence 6-2-2-1.—A defensive system which deploys six men on the first line, two on the secondary line, two on the tertiary line and one man farther back for safety.

Down.—The completion of a play, or the cessation of play by direction of the referee, or by the ball automatically becoming dead.

Drop-kick.—A kick made by dropping the ball from the hand or hands to the ground and kicking the ball immediately it rises from the ground.

Free-kick.—Any kick in which the opponents are restrained by rule from advancing beyond a certain point before the ball is put in play.

Goal from Field.—The kicking of the ball from the field of play either by a drop-kick or by a place-kick, over the cross-bar of the opponents' goal.

Goal from Touchdown.—The kicking of the ball from the field of play, either by a drop-kick or by a place-kick, over the cross-bar of the opponents' goal, following the scoring of a touchdown, the latter giving the scoring team the right to try for a goal from the field at this juncture and, thereby, if successful, to add an "extra point" to the total of their score.

Interference.—Tactics which deploy a player or players in advance of the carrier to prevent opponents from tackling.

Kicking Game.—An attack in which kicking the ball is the principal offensive attack.

Line of Scrimmage.—An imaginary line parallel to the goal line and passing through the point of the ball as the latter rests upon the ground for the purpose of being put in play. There are two such lines, one passing through each of the two points of the ball.

Line Shift.—The sudden change of the players on the line from an initial alinement or position to a secondary alinement or position.

Loose Centre.—A defensive centre who does not retain his position in the line but who falls back to support the line.

Off-side.—A player is off-side when the ball has last been touched by a player behind him.

Off-tackle Run.—A run directed, or accomplished, by the carrier of the ball which passes to the outside of and adjacent to either offensive tackle.

On-side.—A player is on-side when the ball has not last been touched by a player behind him.

Open Formation.—The grouping of the players of a side in a distended manner.

Reversing the Field.—Running across the field from one side to the other by the carrier of the ball.

Safety Man.—The player on defence who plays farthest back as a final defence to the goal; the player on offence who follows the carrier for the purpose of retrieving a possible fumble.

Scoring.—Certain plays are assigned specific numerical values which determine the victory. These plays when achieved, and the numerical values thereof, are as follows:—

Touchdown	6 points
Successful try after touchdown	1 "
Goal from the field	3 "
Safety by opponents	2 "
Forfeiture of game, total score	1 "

Scrimmage.—A scrimmage occurs when the holder of the ball places it flat upon the ground, with its long axis at right angles to the line of scrimmage, and puts it in play by snapping or passing it back; a game of football generally in action.

Shift Play.—Any play in which the players, assuming certain positions at a signal suddenly change their positions into another system of grouping.

Signal, Starting.—A signal secretly given to enable a team to charge forward in unison simultaneously with the putting of the ball in play.

Solid Charge.—A simultaneous charge forward by the seven offensive forwards, standing shoulder to shoulder and driving their opponents straight back.

Split Play.—An offensive play in which the interference or a part of the interference runs in one direction while the carrier of the ball runs in another direction, the course of the interference being designed as a feint.

Spread Play.—A play in which the forwards or backs deploy widely across the field.

Tandem.—The stationing or running of two or more players behind one another in a straight alinement.

(P. H. D.)

HOW TO PLAY AMERICAN RUGBY FOOTBALL

The five important fundamentals of offence and defence are line play, backfield play, tackling, passing and kicking.

Line Play.—Line play is by far the most important. On

BY COURTESY OF AMERICAN SPORTS PUBLISHING CO.

FIG. 1.—STRONG SIDE OF AN UNBALANCED RUSH LINE READY FOR PLAY

offence the player takes a crouching position on hands and feet by placing half of his weight on each, with arms extended from the ground, elbows as stiff as possible, backbone line straight and inclined slightly upward, one foot forward of the other, with head held back so eyes face straight ahead. He must have balance. When he charges his opponent, he must do so with short, piston-like steps, with the rear leg always applying the power.

BY COURTESY OF AMERICAN SPORTS PUBLISHING CO.

FIG. 1A.—PROPER POSITION FOR A CENTRE TRIO ON THE OFFENSIVE

On defence position of middle or centre, linemen remain the same: when they charge they should immediately raise arms, keeping forearms stiff and using their hands freely to break through opponents. The tackles and ends on defence take another position, with one foot behind the other, slightly spread, and both hands swinging slowly until the ball is passed, then their

BY COURTESY OF AMERICAN SPORTS PUBLISHING CO.

FIG. 2.—RUSH LINE DEFENCE, THE CENTRE OUT OF LINE

hands cross line of scrimmage, with forearms rigid, and they use hands freely on opponents. The defensive lineman should keep eyes open while breaking through line of scrimmage.

It is necessary for linemen, either on offence or defence, to get the jump on opponents; that is, to leave their marks quickly and with all power and speed possible. In charging or blocking opponent, the offensive lineman must not use hands or hold the opponent in any way. He can by use of head and neck, assist

FIG. 3.—PROPER METHOD OF CHECKING AN OPPONENT ON THE FIELD

his charging greatly.

The three methods of defensive line play are: (1) in, under and up; (2) knifing; and (3) splitting. In, under and up is placing head and shoulders under opposing lineman and lifting up in time to stop ball carrier. Knifing is twisting the body and shoulders through the offensive line. Splitting is using one hand on each of two opponents, thus dividing them as defensive man makes charge. In both offensive and defensive football the original charge is straight ahead, and fighting should continue until ball carrier is tackled.

Backfield Play.—A backfield man should take offensive position well balanced, with tips of fingers of one hand touching ground, ready to catch ball with hands when passed to him by centre, looking straight ahead always. When receiving ball, one end should be in cup of hand and he should clamp arm down on ball so it is held tightly against his side. When he is tackled, he

BY COURTESY OF SPALDING

FIG. 4.—BACK BLOCKING OUT AN END, AN OFFENSIVE PLAY

should immediately place other hand on ball, using it as cushion to break fall.

The back must side-step, pivot and cross-step when carrying ball. When using straight-arm he should hold arm rigid and snap

BY COURTESY OF SPALDING

FIG. 5.—CORRECT METHOD OF BLOCKING TO CARRY OPPONENT OUT OF THE WAY

defensive player's head or shoulders as latter is about to make tackle. When bucking line, he should hit it with head down and eyes up, body slanting forward, using short piston-like steps, and lifting knees as high as possible. In open field he should run as swiftly as possible, never giving any ground to opponents, but

always going ahead so that when tackled he falls forward.

The most important backfield man in any combination is the back who has ability to block his opponent. To block an opponent, he must turn slightly while driving through air so as to hit opponent with the side of body or hip with enough speed and force to break through defensive man's stiff forearms. On defence the backfield man must be alert and must not leave position until he makes sure which man is carrying ball. His tackle should be hard and aggressive, and he must keep his eyes open. He should always try to develop his passing and kicking ability.

Tackling.—Two methods of tackling are employed by football coaches. One is to leave feet just before hitting ball carrier; the other, and probably better method, is running low with head down and eyes up, grasping opponent around legs just above knees and pulling him toward the body; at the same moment the tackler lifts with his shoulders, at all times making the man carrying ball land on ground first. The opponent can be momentarily stopped or checked even though held only by finger tips.

Kicking.—A kicker lines up approximately 10 yd. behind centre. He should stand with arms extended, one foot behind other. Upon catching ball from centre, he takes one step forward, holding ball with both hands, with lacing on upper right part of ball. When the foot comes in contact with ball, toe should be extended so that foot hits as large a surface of ball as possible, landing on outside of instep. It is necessary to follow through, that is, to have the foot follow ball after contact. When ball is kicked, kicker should spread arms to side in order to keep balance and driving leg straight. A spiral kick is best, because it spirals through air and gets greater height and distance. A player catching punts should attempt to catch the ball—with hands extended but not tense—just below eyes, letting ball drop into hands as an outfielder in baseball would catch a long hit fly ball.

Forward Pass.—To throw a forward pass lay ball diagonally across palm of hand with tips of fingers gripping lacing of ball, the nose of ball extended slightly upward. The hand of the passer should follow the ball through. An over-hand spiral is the best pass to throw. When a player is attempting to throw a forward pass he should have his left hand and arm extended in order to prevent any player rushing him from reaching ball. A forward pass should never be thrown toward the side-line or flank, unless there is no possible chance of interception. When he is throwing a pass down field he should throw as high as receiver can reach, as it is better to have an incomplete pass go over receiver's head than to have it fall too short. A pass should be thrown with a slight trajectory, as this makes an easier ball to catch. When defending against a forward pass, never let the man making catch get behind you.

(J. F. ME.)

SIGNALS

Football signals enable the quarter-back, the field captain, to transmit his orders to his team in terms not understood by the opponents. Football signals are commands. They are given

BY COURTESY OF SPALDING

FIG. 6.—HALF-BACK'S POSITION TO START

BY COURTESY OF SPALDING

FIG. 7.—BACKFIELD PLAYER RECEIVING A PUNT

in one of four ways: by signs, words, letters and numbers. Number signals are most generally used. However, deaf mutes use sign signals, and to some extent signs, words and letters are used by all teams in special plays. The three uses for football signals are: to designate the formation and the play to be used from that formation; as a snap or starting signal so that all members of a team know when the ball is to be put into play without the

BY COURTESY OF SPALDING

FIG. 8.—FORMATION OF BACK FIELD FOR THE OFFENSIVE

necessity of watching the ball; as defensive signals. The first two are used by an offensive team, the team in possession of the ball; while the third is used by a defensive team, the team without the ball. Defensive signals, usually given by the centre, determine what each man of the defence must do. There are various defensive signals because varied forms of attack are met differently on defence.

A signal must be plain and simple enough so that it will be easily and quickly understood by the players on the offence. Leading coaches agree that the best system of signals is to have one number or signal for each play. This number or signal not only tells each player the formation from which the play is to be run but tells him what he is to do in that play, *i.e.*, whether the player blocks, runs with the ball, goes out to receive a pass, kicks, goes down under a punt, makes the pass, etc. All systems of signals are made up with companion plays. The odd number play will go to the right of the line and the even number play to the left, or vice versa. For example, a play 21 would go to the right of the line, 22 would be the same play only to the left side of the line. This play number can be easily concealed so that it will be impossible for the opposing team to detect it. For example: 21 may represent a play number and the number for the play to be used may be given by using the second number called,

BY COURTESY OF SPALDING

FIG. 9.—CENTRE PASSING THE BALL TO QUARTER-BACK

as 18-21-23, 21 being the play number. This can be changed to the third or fourth number by inserting meaningless numbers. For instance, any number ending in five may be used as a blank number so far as offence is concerned, as 35-18-21-23. To the defensive team 21 is now the third number but to the offence it is still the second number called because any number ending with a five is not counted.

The "huddle," which is being extensively used, enables the players to hear the signals easily without the opponents hearing them. Thus, it is only necessary for the quarter-back to call the

actual play number, as 21 in the above example. Any other play number may be given in the same way. See Spalding Official Football Guide. (F. H. Y.)

FOOTE, ANDREW HULL (1806-1863), American admiral, was born at New Haven, Conn., Sept. 12, 1806, his father, Samuel Augustus Foote (1780-1846), being a prominent lawyer and Whig politician, who as U.S. senator moved in 1829 "Foote's resolutions" on public lands, in the discussion of which Daniel Webster made his "reply to Hayne." He entered the U.S. navy in 1822, and was commissioned lieutenant in 1830. After cruising round the world (1837-40) in the "John Adams," he was assigned to the Philadelphia naval asylum, and later (1846-48) to the Boston navy yard. In 1849 he was made commander of the "Perry," and engaged for two years in suppressing the slave trade on the African coast. In 1856, as commander of the "Portsmouth," he served on the East India station, under Commander James Armstrong, and he captured the Barrier Forts near Canton. From Oct. 1858 to the outbreak of the Civil War, he was in charge of the Brooklyn navy yard, becoming a full captain in 1861. In Aug. 1861 he was assigned to the command "of the naval operations upon the Western waters." His exploit in capturing Ft. Henry (on the right bank of the Tennessee river) from the Confederates, on Feb. 6, 1862, without the co-operation of Gen. Grant's land forces, who had not arrived in time, was a brilliant success; but their combined attack on Ft. Donelson (12 m. off, on the left bank of the Cumberland river), whither most of the Ft. Henry garrison had escaped, resulted, before its surrender (Feb. 16), in heavy losses to Foote's gunboats, Foote himself being severely wounded. In March-April he co-operated in the capture of New Madrid (*q.v.*) and Island No. 10. In June he retired from his command and in July was promoted rear-admiral, and became chief of the bureau of equipment and recruiting. On June 26, 1863 he died at New York.

See the *Life* (1874) by Professor James Mason Hoppin (1820-1906).

FOOTE, SAMUEL (1720-1777), English dramatist and actor, was baptized at Truro on Jan. 27, 1720. His father was a man of good family. Foote was educated at the collegiate school, Worcester, and at Worcester college, Oxford, but left Oxford without taking a degree. He was designed for the law, and his days at the Temple at least taught him something of lawyers, and enabled him later to satirize the profession with success. The argument in *Hobson v. Nobson* (*The Lame Lover*) is comparable to that in *Bardell v. Pickwick*. Through the Bedford Coffee-house he found his way into the theatrical world. He inherited two fortunes, on the deaths of his father and uncle, and ran through them both. There is a story that he was married in Worcestershire (he said himself that he was married to his washerwoman), but nothing is known of it.

His first appearance on the stage was in 1744. But he was a failure in tragedy (as *Othello*), and only partially successful in genteel comedy. At last he succeeded in exploiting his real gift, an astonishing talent for mimicry. His first essay in this form of entertainment, which he carried on under various names for years, was called *Diversions of the Morning*, consisting of a series of "take-offs" of actors and other well-known people, with an epilogue satirising the wits of the Bedford Coffee-house. An attempt to suppress it failed, and it became, in its successive forms, an established favourite. Meanwhile he also played at Covent Garden and Drury Lane and toured in Scotland and Ireland, mostly in his own comedies. At a later date (1773) a new device was introduced in a puppet-show. The piece played in this by the puppets was called *Piety in Pattens*, and was an attack on sentimental comedy. It contained originally an attack on Garrick, but in the end trouble was avoided by leaving this out. On the whole, relations between the two public favourites became very friendly, and on Foote's part definitely affectionate. Boswell states that Johnson liked his company, found him "irresistible," and thought his career worthy of biographical record. Lord Mexborough and the duke of York teased Foote into boasting of his horsemanship, and then took him out to hounds on a dangerous animal. He fell and broke his leg, which was amputated. The duke of York made him the best reparation in his power by promising him a

life-patent for the Haymarket; and Foote not only resumed his profession, but ingeniously turned his misfortune to account in *The Lame Lover* and *The Devil on Two Sticks*.

He still retained his hold over the public, but about 1774, when he was thinking of retiring at least temporarily, he became involved in a fatal quarrel. Never so far had he put any restraint on his personal satire. *The Author*, with its attack on Ap-Rice, had ultimately been suppressed, but otherwise he had continued to ridicule whom he liked, medical quacks, religious enthusiasts like Dr. Dodd, the whole Society of Antiquaries (in *The Nabob*), and even the Nabobs themselves. But he took one risk too many. It was rumoured that he intended to bring on the stage the duchess of Kingston, whose trial for bigamy was then impending (1775). She got the Lord Chamberlain to prohibit the piece. After its withdrawal, and an exchange of characteristic letters between him and the Duchess, he took his revenge on one of her chief instruments, Dr. Jackson, whom he gibbeted as Viper in *The Capuchin* (performed 1776). Jackson then suborned a discharged servant of Foote's to bring a charge of assault against him. Though this broke down, the struggle broke down his health, and even his audiences seemed to be divided. He resolved to withdraw for a time, let his theatre and set out for a journey to France. He fell sick at Dover and died there on Oct. 21, 1777. He is buried in Westminster Abbey.

See W. Cooke, *Memoirs of Samuel Foote* (3 vols., 1805), *The Dramatic works of Samuel Foote* (ed. by "John Bee," 3 vols., 1839), P. Fitzgerald, *Samuel Foote, A Biography* (1910).

FOOT GUARDS: see GUARDS.

FOOTINGS: see FOUNDATIONS.

FOOTSCRAY, a suburb of Melbourne, Australia, on the Salt-water river. It has large bluestone quarries from which most of the building stones in Melbourne and the neighbourhood is obtained, and is an important manufacturing centre, with numerous sugar mills, jute factories, soap works, woollen mills, foundries, chemical works and many other minor industries.

FOPPA, VINCENZO (c.1427-c.1515), Italian painter, was born near Brescia. He settled in Pavia towards 1456, and was the head of a Lombard school of painting which subsisted up to the advent of Leonardo da Vinci. In 1489 he returned to Brescia. Among his noted works are a fresco in the Brera Gallery, Milan, the "Martyrdom of St. Sebastian"; and a "Crucifixion" in the Carrara gallery, Bergamo, executed in 1455. He worked much in Milan and in Genoa.

See C. J. Ffoulkes and R. Maiocchi, *Vincenzo Foppa* (1910).

F.O.R. A contraction of the expression "free on rail," used in commerce to denote the fact that a price quoted for goods is inclusive of all costs of carriage and handling in placing them on the railway ready for their transit to destination, but not inclusive of the railway charges for carriage. "F.O.B." is used in this sense in the United States.

FORAGE, food for cattle or horses, chiefly the provender collected for the horses of an army. In early usage the word was confined to dried forage as opposed to grass. From this word comes "foray," an expedition in search of "forage," and hence a pillaging expedition, a raid. The word "forage," directly derived from Fr. *fourrage*, comes from a common Teutonic origin, and appears in "fodder," food for cattle. The ultimate Indo-European root, *pat*, cf. Gr. *πατεσθαι*, Lat. *pascere*, to feed, gives "food," "feed," "foster"; and appears also in such Latin derivatives as "pastor," "pasture."

FORAIN, JEAN LOUIS (1852-), French painter and illustrator became one of the leading modern Parisian caricaturists, and in his merciless exposure of the weaknesses of the *bourgeoisie* continued the work which was begun by Daumier under the second Empire. The scathing bitterness of his satire is as clearly derived from Daumier as his pictorial style can be traced to Manet and Degas; but even in his painting he never suppresses the caustic spirit that drives him to caricature. He has, indeed, been rightly called "a Degas pushed on to caricature." In his pen-and-ink work he combines extraordinary economy of means with the utmost power of expression and suggestion. Forain's popularity dates from the publication of his

Comédie parisienne, a series of 250 sketches republished in book form. He has contributed many admirable, if sometimes over-daring, pages to the *Figaro*, *Le Rire*, *L'Assiette au beurre*, *Le Courrier français* and *L'Indiscret*. His political drawings for the *Figaro* were republished in book form under the title of *Donx Pays*.

See M. Guérin, *J. L. Forain lithographe* (1910); *Forain aquafortiste* (1912).

FORAKER, JOSEPH BENSON (1846-1917), American political leader, was born near Rainsboro, Highland county, Ohio, on July 5, 1846. He passed his early life on a farm, enlisted as a private in July 1862, served throughout the Civil War and in 1865 received a captain's brevet. After the war he spent two years at the Ohio Wesleyan university and two years at Cornell. In 1869 he was admitted to the Ohio bar and practised law with great success in Cincinnati. He was a judge of the Cincinnati superior court from 1879 to 1882, and from 1885 to 1889 was governor of Ohio. In 1896 he was elected United States senator, was re-elected in 1902 and served until 1909. In the Senate he was one of the aggressive Republican leaders, strongly supporting the administration of President McKinley in the debates preceding, during and immediately following the Spanish-American War. During the administration of President Roosevelt he vigorously opposed various measures advocated by the President, and led the opposition to the president's summary discharge of certain negro troops after the Brownsville raid of Aug. 13, 1906. (See BROWNSVILLE, Texas.) In 1916 he published *Notes of a Busy Life*. He died in Cincinnati on May 10, 1917.

FORAMINIFERA. Marine single-celled animals (Protozoa) which have their protoplasm contained in a calcareous shell, which is usually perforated by numerous pores, through which issue delicate protoplasmic processes (so-called rhizopods), which serve for catching food and for locomotion. They are frequently present in such numbers that their shells form a considerable proportion of the ooze which covers the floor of the ocean. The best known of these is *Globigerina* (q.v.). Chalk rocks were formed in seas of past geological epochs almost entirely of the shells of Foraminifera. See PROTOZOA.

FORBACH, a town of France, dept. of Moselle (Alsace-Lorraine) on the affluent of the Rossel, and on the railway from Metz to Saarbrücken, 5½ m. S.W. of the latter. Pop. (1926) 7,467. Its industries include the manufacture of tiles and pasteboard wares, while there are coal mines in the vicinity. On the Schlossberg near the town are the ruins of the castle of the counts of Forbach, a branch of the counts of Saarbrücken. It is the capital of the arrondissement of the same name and has a sub-prefecture.

FORBES, ALEXANDER PENROSE (1817-1875), Scottish divine, was born at Edinburgh on June 6, 1817. In 1836 he joined the Indian Civil Service, but in consequence of ill-health was obliged to return to England. He then entered Brasenose college, Oxford, and won the Roden Sanskrit scholarship (1841), graduating in 1844. At Oxford he was powerfully influenced by Newman, Pusey and Keble. This led him to resign his Indian appointment. In 1844 he was ordained deacon and priest, and in 1848 succeeded Bishop Moir in the see of Brechin. He removed the episcopal residence to Dundee, where he resided till his death. He was prosecuted in the church courts for heresy, but acquitted with "a censure and an admonition." Forbes was a good scholar, a scientific theologian and a devoted worker, and was much beloved. He died at Dundee on Oct. 8, 1875.

Principal works: *A Short Explanation of the Nicene Creed* (1852); *An Explanation of the Thirty-nine Articles* (2 vols., 1867 and 1868); *Commentary on the Seven Penitential Psalms* (1847); *Commentary on the Canticles* (1853). See Mackey's *Bishop Forbes, a Memoir*.

FORBES, ARCHIBALD (1838-1900), British war-correspondent, was born in Morayshire and educated at Aberdeen university. He served for a short time as a private in the Royal Dragoons before entering journalism. Forbes was one of the greatest war-correspondents of his day, and his exploits in securing and despatching copy from various theatres of war became a legend in Fleet street. He went through the Franco-German war of 1870 for the *Morning Advertiser* and the *Daily News*; the

second Carlist War, the Serbian campaign of 1876, the Russo-Turkish War of 1877, the Afghan War of 1878 and the Zulu War of 1879. Of his many publications may be mentioned *Memories and Studies of War and Peace* (1895), much of which is autobiographical. He died on March 30, 1900.

FORBES, DAVID (1828-1876), British mineralogist, metallurgist and chemist, brother of Edward Forbes (*q.v.*), was born on Sept. 6, 1828, at Douglas, Isle of Man, and studied chemistry at the university of Edinburgh. He was superintendent of the mining and metallurgical works at Espedal in Norway, then a partner in the firm of Evans & Askin, nickel-smelters, of Birmingham, and in that capacity during the years 1857-60 visited Chile, Bolivia and Peru. His observations on the geology of South America threw much light on igneous and metamorphic phenomena and on the resulting changes in rock-formations. In England he was a pioneer in microscopic petrology. He was elected F.R.S. in 1858, and died in London on Dec. 5, 1876.

Forbes wrote upwards of 50 papers on scientific subjects, among which are the following: "The Action of Sulphurets on Metallic Silicates at High Temperatures," *Rep. Brit. Assoc.*, 1855, pt. ii. p. 62; "The Relations of the Silurian and Metamorphic Rocks of the South of Norway," *ib.* p. 82; "The Causes Producing Foliation in Rocks," *Journ. Geol. Soc.* xi., 1855; "The Chemical Composition of the Silurian and Cambrian Limestones," *Phil. Mag.* xiii. pp. 365-373, 1857; "The Geology of Bolivia and Southern Peru," *Journ. Geol. Soc.* xvii. pp. 7-62, 1861; "The Mineralogy of Chile," *Phil. Mag.*, 1865; "Researches in British Mineralogy," *Phil. Mag.*, 1867-68. See the obituary notices by P. M. Duncan in *Quart. Journ. Geol. Soc.*, vol. xxxiii., 1877, and by J. Morris in *Geol. Mag.*, 1877.

FORBES, DUNCAN, OF CULLODEN (1685-1747), Scottish statesman, son of Duncan Forbes (1644?-1704), genealogist and M.P. for Nairn, was born at Bunchrew or at Culloden near Inverness on Nov. 10, 1685. He studied at Edinburgh and Leiden, and was advocate and sheriff of Midlothian in 1709. The influence of the Argyll family and his loyalty to the Hanoverian cause in 1715 secured his rapid advancement. He became M.P. for Inverness (1722), lord advocate (1725), and lord president of the court of session (1737).

Some years before the rising of Forty-five Forbes had urged upon the government the expediency of embodying Highland regiments, putting them under the command of colonels whose loyalty could be relied upon, but officering them with the native chieftains and cadets of old families in the north. In 1739, with Sir Robert Walpole's approval, the original (1730) six companies (locally enlisted) of the Black Watch were formed into the famous "Forty-second" regiment of the line.

On the first rumour of the Jacobite rising in 1745 Forbes hastened to Inverness, and through his personal influence with the chiefs of Macdonald and Macleod, these clans were prevented from taking the field for Charles Edward; the town itself also he kept loyal. In September 1745, after Cope's departure to the south, Forbes was the sole representative of government in the north. He worked hard to maintain order. But advances of arms and money arrived too late, and though Forbes employed all his own means and what money he could borrow on his personal security, his resources were quite inadequate to the emergency. It is doubtful whether these advances were ever fully repaid. Part was doled out to him, after repeated solicitations that his credit might be maintained in the country; but it is evident his humane exertions to mitigate the savage revenge on the rebels after their defeat at Culloden had brought him into disfavour in London. Forbes died on the 10th of December 1747.

Forbes was a patriot without ostentation or pretence, a true Scotsman with no narrow prejudice, an accomplished and even erudite scholar without pedantry, a man of genuine piety without asceticism or intolerance. His statue by Roubiliac stands in the Parliament house, Edinburgh.

See *Memoirs of the Life of the late Rt. Hon. Duncan Forbes* (1748); *Culloden Papers*, with memoir by Duff (1815); John Hill Benton, *Lives of Simon Lord Lovat, and Duncan Forbes of Culloden* (1847).

FORBES, EDWARD (1815-1854), British naturalist, was born at Douglas, Isle of Man, on Feb. 12, 1815. He studied medicine at Edinburgh, and in 1833 made a tour in Norway, the

botanical results of which were published in Loudon's *Magazine of Natural History* for 1835-36. In 1836 he forsook medicine for natural science, and after a winter of lectures in Paris, he went to Algiers, where he obtained materials for a paper on land and freshwater Mollusca, published in the *Annals of Natural History*, vol. ii. In 1838 appeared his *Malacologia Monensis*, a synopsis of the species of Manx Mollusca, and in 1841 his *Hist. of Brit. Star-fishes*. From 1841 to 1842 he was employed in investigating the botany, zoology and geology of the Mediterranean region, the results being made known in his "Report on the Mollusca and Radiata of the Aegean Sea, presented to the British Association in 1843," and in *Travels in Lycia* (1847). In 1842 Forbes became curator of the museum of the Geological Society of London, in 1843 professor of botany at King's College, and in 1844, palaeontologist to the Geological Survey of Great Britain. Two years later he published in the *Memoirs of the Geological Survey*, i. 336, his important essay "On the Connexion between the distribution of the existing Fauna and Flora of the British Isles, and the Geological Changes which have affected their Area," in which he maintains that the plants of Great Britain may be divided into five well-marked groups and that the majority of them, like the terrestrial animals, migrated to these islands over continuous land at three distinct periods, before, during and after the glacial epoch. In 1851 Forbes became professor of natural history to the Royal School of Mines, and in the following year published the fourth volume of Forbes and S. Hanley's *History of British Mollusca* and his *Monograph of the Echinodermata of the British Tertiaries* (Palaeontographical Soc.). In 1854 he became professor of natural history at Edinburgh, but he died on Nov. 18 of that year at Wardie, near Edinburgh.

See G. Wilson and A. Geikie, *Memoir of Edward Forbes* (1861), containing a list of Forbes's writings, *Literary Papers*, ed. Lovell Reeve (1855) and *Forbes' Centenary Commemoration* by the London Manx Society (1915). The following works were issued posthumously: "On the Tertiary Fluvio-marine Formation of the Isle of Wight" (*Geol. Survey*), edited by R. A. C. Godwin-Austen (1856); "The Natural History of the European Seas," edited and continued by R. A. C. Godwin-Austen (1859).

FORBES, JAMES DAVID (1809-1868), Scottish physicist, was born at Edinburgh on April 20, 1809. He studied at Edinburgh, became F.R.S.E. (1828) and F.R.S. (1832), professor at Edinburgh (1833-59), and principal of the United college at St. Andrews (1859-68). He died on Dec. 31, 1868.

As a scientific investigator he is best known for his researches on heat and on glaciers. Between 1836 and 1844 he published in the *Trans. Roy. Soc. Ed.* four series of "Researches on Heat," in the course of which he described the polarization of heat by tourmaline, by transmission through a bundle of thin mica plates inclined to the transmitted ray, and by reflection from the surfaces of a pile of mica plates placed at the polarizing angle, and also its circular polarization by two internal reflections in rhombs of rock-salt. In 1846 he began experiments on the temperature of the earth at different depths and in different soils near Edinburgh; he determined the thermal conductivity of trap-tufa, sandstone and pure loose sand. Later he investigated the laws of the conduction of heat in bars, and his last piece of work was to show that the thermal conductivity of iron diminishes with increase of temperature. The Royal Society awarded him the Rumford Medal in 1838 and the Gold Medal in 1843 for his work on heat.

He made several visits to Switzerland and also to Norway to study the flow of glaciers and developed a theory which involved him in some controversy with Tyndall and others both as to priority and to scientific principle.

See Principal Shairp, Professor P. G. Tait and A. Adams-Reilly, *Forbes's Life and Letters* (1873); J. Tyndall, *Professor Forbes and his Biographers* (1873).

FORBES, a municipal town of Ashburnham county, New South Wales, Australia, 289 m. W. by N. from Sydney, on the Lachlan river, and with a station on the G.W. railway. Pop. (1921) 4,650. It has steam-sawing and flour-mills, breweries and wool-scouring establishments; while the surrounding country produces good quantities of cereals, lucerne, wine and fruit.

FORBES-ROBERTSON, SIR JOHNSTON (1853–), English actor, was born on Jan. 16, 1853, the son of John Forbes-Robertson of Aberdeen, an art critic. He was educated at Charterhouse, and studied at the Royal Academy schools, but in 1874 he turned to the theatre, making his first appearance in London as Chastelard, in *Mary, Queen of Scots*. He studied under Samuel Phelps, played with the Bancrofts and with John Hare, supported Miss Mary Anderson both in England and America, and acted at different times with Sir Henry Irving. In Pinero's *The Profligate* at the Garrick theatre (1889), under Hare's management, he made a great name for himself. In 1895 he started under his own management at the Lyceum with Mrs. Patrick Campbell, producing *Romeo and Juliet*, *Hamlet*, *Macbeth*, and also some modern plays, among these being John Davidson's *For the Crown* and Maeterlinck's *Pelléas and Mélisande*, in both of which he found parts admirably suited to his romantic temperament. In 1900 he married Gertrude Elliott, with whom he appeared at various theatres, producing in subsequent years *The Light that Failed*, Madeleine Lucette Riley's *Mice and Men*, and G. Bernard Shaw's *Caesar and Cleopatra*, Jerome K. Jerome's *Passing of the Third Floor Back*, etc. He was knighted in 1913, and made a farewell tour of Canada and America before finally retiring from the stage in 1915.

See Sir J. Forbes-Robertson, *A Player Under Three Reigns* (1925).

FORBIN, CLAUDE DE (1656–1733), French naval commander, was born at Gardanne, Provence, on Aug. 6, 1656. He went to Siam in 1685 with the Chevalier de Chaumont, sent by Louis XIV. at the invitation of the King of Siam to introduce European civilization in that country. He remained as admiral and general-in-chief to the King of Siam until 1687. He was the colleague of Jean Bart in his irregular operations in the Channel, and distinguished himself at the battle of Lagos. From 1702 to 1710 he served in the French navy as *chef d'escadre*, and played a particularly brilliant part in the War of the Spanish Succession. In 1710 he retired to Saint-Marcel, near Marseilles, where he died on March 4, 1733. The latter part of his life was spent in writing his *Mémoires* (1730).

FORCE. In general, strength or intensity of effort as applied to physical action. It is also used to denote a military or naval unit; for its legal application see **DURESS**. In physics *force* is that which produces acceleration. See **MECHANICS**.

FORCED LABOUR: see **SLAVERY**.

FORCELLINI, EGIDIO (1688–1768), Italian philologist, was born on Aug. 26, 1688, at Fener, Treviso, and studied at Padua under Faccioliati (*q.v.*). From 1724 to 1731 he held the office of rector of the seminary at Ceneda, and from 1731 to 1765 that of father confessor in the seminary of Padua. He died at Padua on April 4, 1768, before the completion of the vast *Latin Lexicon*, on which he had for 35 years collaborated with Faccioliati.

FORCHHAMMER, PETER WILHELM (1801–1894), German classical archaeologist, was born at Husum, Schleswig on Oct. 23, 1801 and was educated at Lübeck and the university of Kiel, with which he was connected for nearly 65 years. In 1830–34 and 1838–40 he travelled in Italy, Greece, Asia Minor and Egypt. In 1843 he was appointed professor of philology at Kiel and director of the archaeological museum founded by himself in co-operation with Otto Jahn. He died on Jan. 8, 1894. Forchhammer represented the progressive party of Schleswig-Holstein in the German Reichstag from 1871 to 1873. His published works deal chiefly with topography and ancient mythology. *Hellenika. Griechenland. Im Neuen das Alte* (1837) contain his theory of the origin and explanation of the Greek myths which, according to him, arose from definite local (especially atmospheric and aquatic) phenomena, and represented the annually recurring processes of nature as the acts of gods and heroes.

For a full list of his works see the obituary notice by E. Alberti in C. Bursian's *Biographisches Jahrbuch für Altertumskunde*, xx. (1897); also J. Sass in *Allgemeine deutsche Biographie*, and A. Hoeck and L. C. Pertsch, P. W. Forchhammer (1898).

FORCHHEIM, a town of Germany, in the republic of Bavaria, near the confluence of the Wiesent and the Regnitz, 16 m. S.S.E. of Bamberg. Pop. (1925) 9,574. Forchheim was

the residence of the Carolingian sovereigns, including Charlemagne, in the 9th century. Many diets were held here, and here Conrad I. and Louis the Child were chosen German kings. The town was given by the emperor Henry II. in 1007 to the bishops of Bamberg, and, except for a short period during the 11th century, it remained in their possession until 1802, when it was ceded to Bavaria. The fortifications of the town were dismantled in 1838. It has a Gothic Collegiate church and industries of the town include spectacle making and weaving, dyeing, brewing and paper-making. The château occupies the site of the Carolingian palace which was destroyed in 1246.

FORD, EDWARD ONSLOW (1852–1901), British sculptor, was born at Islington on July 27, 1852. He was educated at Blackheath, and studied art at Antwerp, and at Munich, where he married in 1873, Anne Gwendolen, daughter of Baron Frans von Kreuzer. About 1874 Ford returned to Blackheath, and attracted attention in the Academy by a bust of his wife. His more important works include the statue of Rowland Hill at the Royal Exchange (1881); "Irving as Hamlet" (1883, in the Guildhall art gallery); "Gordon" (1890, examples at Chatham and Khartoum); the Shelley memorial in University college Oxford (1892), the equestrian statue of Lord Strathnairn at Knightsbridge (1895) and the memorial to Queen Victoria at Manchester (1901). Among the many busts which he modelled may be mentioned Millais, Huxley, Herbert Spencer, the duke of Norfolk, Sir Lawrence Alma-Tadema, and Sir Walter Armstrong. His bronze statuettes became known by his permitting publication of small replicas. The most successful were "Folly" (now in the Tate gallery), "The Singer," "Applause," "Peace" and "Echo." Ford was elected A.R.A. in 1888 and R.A. in 1895. He died in London on Dec. 23, 1901.

FORD, HENRY (1863–), American manufacturer, was born on a farm near Dearborn, Mich., gm. W. of Detroit, of William and Mary Litogot Ford. William Ford was of English descent; born near Cork, Ireland, whence the Ford family emigrated to America in 1847, settling near Dearborn. Mary Litogot was born in the United States of Dutch parents. Mrs. Ford died when her son was 12. Henry Ford went to school until he was about 15, but worked on the farm after school hours and during vacations. He began early to develop an intense interest in mechanics. He was attracted first to watches, and at 13 he took a watch apart and put it together again. In a little while he was repairing watches and clocks throughout the surrounding country, not for pay but because he had a burning curiosity to see how watches and clocks were made. His only tools were a screwdriver made from a knitting needle and a pair of tweezers fashioned from an old watch spring. All this work was done at night; later it was done secretly, because William Ford objected to the son giving his services free. Also, he wanted the boy to be a farmer, while the boy wanted to be a mechanic.

At 16 Henry could no longer tolerate farm work. He left home, walked to Detroit, and apprenticed himself in a machine shop at a weekly wage of \$2.50, working ten hours a day. His board and lodging cost him \$3.50 a week. In order to make up the deficit he took employment with a jeweller from 7 to 11 in the evening, for which he received \$2.00 a week. In about a year he turned from machine shop to an engine shop to learn something of the building of engines. There he stayed two years. A company manufacturing small steam engines for farm use needed a man to install them; Ford took the place and for two years more set up and repaired these engines. He had gone back to the farm to live; there he spent all his spare time in a little workshop trying to build a farm tractor—for his experience with the portable engines, as well as his own farm experience, had convinced him that power should be put to work on the farm and that it was a waste to keep horses. Eventually he built a single-cylinder engine steam tractor, but he could not devise a boiler to provide pressure enough to keep the tractor at work ploughing and yet be light enough for his requirements. For the time being he gave up his tractor until he could discover a more suitable boiler. Large steam tractors were already in use, but Ford's thought even then was in the direction of inexpensive, simple apparatus.

In 1884 Ford's father offered him 40ac. of land in order to draw him away from his mechanics. The land was mostly wooded. Henry cut the timber, set up a sawmill and sold lumber. In the summer he repaired farm engines. In 1887 he married Clara Bryant, who lived in the neighbourhood. He sawed the lumber for his house, which he built himself on his plot of ground, and having done this he moved his workshop from his father's farm to his new home. Securing a job with the Detroit Edison company as an engineer and machinist he moved from the farm to Detroit, where he set up his shop in a shed at the back of his house. After hours he worked on the building of a gasoline motor car. In 1892 he completed it—although it did not run properly until the following year. This, his first car, had two cylinders with a 2½ in. bore and a 6 in. stroke, set side by side over the rear axle, and developed about 4 h.p., which was transmitted from the motor to the countershaft by a belt and from the countershaft to the rear wheel by a chain. He ran this car about 1,000 m. and then sold it for \$200, in order to start the building of another car which would be lighter and stronger. In 1899, feeling that he had the experience he needed, Ford left his job with the electric light company and went into the making of automobiles as a business, with a company, of which he was the chief engineer, known as the Detroit Automobile company. He held only a small portion of the stock, and the company would not follow the lines of manufacturing to which he had committed himself. The directors wanted to make cars to order only; Ford had in his mind a universal car which could be made in quantities. In 1902 he resigned in order to go into business for himself when the opportunity should arise. In the meantime he rented a one-storey brick shed and continued his experiments. He built several cars, two of them solely for speed. One he called the "999" and the other the "Arrow." Each had a four-cylinder engine giving 80 horsepower. The "999" won every race it entered, and in 1903, on the reputation of this speed car, Ford formed the Ford Motor company, with a capitalization of \$100,000. Actually only \$28,000 in stock was ever subscribed, and of this only about one-half was in actual cash. The company in 1926 had assets of about \$1,000,000,000 and was the largest motor car company in the world and the third largest industry in the United States, comprising in itself about 50 other industries and employing some 200,000 people directly and an equal number indirectly. It has been built up entirely by turning back profits into construction. The company has never issued bonds or borrowed money; nor has it issued stock otherwise than to enlarge the original capitalization so as to have it more nearly correspond with values. It is entirely owned by Henry Ford and his son, Edsel B. Ford, they having bought out the minority stockholders in 1919 for \$70,000,000.

During its first year the company built a two-cylinder, 8 h.p. car with a chain drive, and of these 1,708 were produced and sold. In the second year it made three models and during five years various models of four- and six-cylinder cars. The automobile at that time was considered a pleasure vehicle, but Ford had conceived of it as a universal method of individual transportation and he was working to produce a light car of great strength, which would require a minimum of care and cost in upkeep. What delayed him was finding a steel sufficiently strong for his purpose, and it was quite by accident that he came upon a piece of vanadium steel, which was not then made in the United States. With that steel he designed Model T—which is what is known to-day as the "Ford car." In 1909 Ford announced that thereafter the company would build only the model T chassis, and that "Any customer can have a car painted any colour that he wants, so long as it is black."

The principles upon which the Ford industries are founded, as Ford has stated them, are:

1. An absence of fear of the future or veneration for the past. One who fears the future, who fears failure, limits his activities. Failure is only the opportunity more intelligently to begin again. There is no disgrace in honest failure; there is disgrace in fearing to fail. What is past is useful only as it suggests ways and means for progress.
2. A disregard of competition. Whoever does a thing best ought to be the one to do it. It is criminal to try to get business away from

another man—criminal because one is then trying to lower for personal gain the condition of one's fellowmen—to rule by force instead of by intelligence.

3. The putting of service before profit. Without a profit, business cannot extend. There is nothing inherently wrong about making a profit. Well-conducted business enterprise cannot fail to return a profit, but profit must and inevitably will come as a reward for good service. It cannot be the basis—it must be the result of service.

4. Manufacturing is not buying low and selling high. It is the process of buying materials fairly and, with the smallest possible addition of cost, transforming those materials into a consumable product and giving it to the consumer. Gambling, speculating and sharp dealing tend only to clog this progression.

In the Ford practice the cycle of production starts with the consumer. Ford holds that a commodity must first of all be designed to fit the needs of the largest possible number of consumers both in quality and price, and that the number of consumers will be continuously increased by constantly lowering the price of the article. At the same time, by paying the highest possible wages to those engaged in the production and distribution of the article, he creates a high buying power. In Jan. 1914 Ford raised all wages in his industries to a minimum of \$5.00 for an eight hour day. The average wage throughout his industries at that time was \$2.40 for a nine hour day. The minimum wage in 1926 was \$6.00 a day, with an average of \$8.00. Model T (the touring car) which in the beginning cost \$850, in 1926, with the average wage about four times larger than then and with materials costing at least double, sold for \$310, with a self-starter and many improvements. From the introduction of Model T on Oct. 1, 1908, it took the company until Dec. 10, 1915, to produce a million cars, but under the new wage programme and the constant lowering of prices the company was in 1926 producing at the rate of two million cars a year.

The general theory of production in the Ford plants is that everything must be kept moving, and that the work must go to the man instead of the man to the work. For example, the cylinder block is cast on a moving platform in a mould made on a moving platform. Thereafter it passes, without stopping, through a series of machines which perform all the necessary operations, and then, still moving, it passes into assembly, where to it are added, one by one, the hundreds of parts to create a complete motor. Then it moves into the final assembly, where it is joined by other parts until eventually an automobile leaves the final assembly line under its own power. Every part of the motor car has a similar train of construction and assembly, all converging either into the final assembly or into boxes or freight cars for shipment. No man uses more than one tool, all the work comes waist high, a man never has to stoop or to move his feet to get anything, and the speed of the work is controlled, not by the worker's will, but by the pace of the conveyor.

The Ford industries have been steadily reaching back to sources in order to cut out intermediate profits. The industries have their own iron mines, coal mines and forests, their own railway, and an extensive fleet of lake- and ocean-going steamships, all of which are operated on the principle of high wages, high production and low cost. In the forests no tree is permitted to be cut under 10 inches. The logs are taken directly to the sawmill and, instead of being first converted into lumber and the parts sawed from the lumber, the parts are sawed directly from the log. All the wood-working is done at the forest mill, the waste goes to a wood distillation plant, and there is no waste whatsoever in shipment. At the River Rouge plant, the iron from the furnace goes directly into the foundries and is poured without reheating. The slag from the furnaces goes to a cement plant. A combination of electric furnaces and a large rolling mill converts all the steel scrap. In every direction the pressure is toward preventing the waste of time, men or material.

As the business developed, it became apparent that it was a waste to assemble the cars at the factory and ship them complete. The manufacturing plants then ceased in effect to manufacture automobiles; instead, they make parts, and these are shipped to 35 branches in the United States, where they are assembled into complete motor cars. Similar branches or associated companies are situated in nearly every part of the world, and these branches

also manufacture if the costs permit. Foreign branches, under the theory of building consumption, employ only natives of the country in which they are located. All the branches use the same methods and pay the same wages as the home plants. The industry does not use a single warehouse—everything is in transit. The centre of the industry is at Detroit, Mich., and at River Rouge, Mich., on the outskirts of Detroit; but with the method of assembling cars at the point of use, a decentralizing of manufacturing is taking place and comparatively small plants are being located out in the country wherever proper water-power sites are available. Each of these plants makes only a single part; the thought behind their establishment is to strike a balance between industry and agriculture. None of these plants employs more than 500 men, and in most cases the men divide their time between agriculture and industry. This is one of the most important developments.

In the spring of 1928 car number 15,000,000 was produced, and shortly thereafter it was decided to discontinue the making of Model T, on which the business had been founded, and turn to a new model. Thereupon came the test of the mobility of an industry that had been built entirely upon the making of one thing. The new Model T was in most respects unlike the first Model T, but the parts of the new Model T were all interchangeable with those of the first—although in most cases the designs had been changed and the materials were constantly changing. Ford does not interpret quantity production as rigid production. The new model, however, marked a complete departure from the old model, both in design and in many methods of manufacturing. In the design of the new model it was decided to make use of new developments in manufacturing, particularly in electric welding and in the forging and spinning of metals. Also nearly all wood was eliminated. The purpose of the original car was to provide cheap and simple transportation. When it came out, people were unaccustomed to the management of machinery, they knew nothing about internal combustion engines, and the roads were bad. In the meantime, they have become accustomed to machinery and the roads have bettered. Therefore, the new car was designed to fill a function different from that of the old Model T but at the same price. Into it was put a standard gear shift, a new type of engine capable of picking up very quickly and of attaining a speed of between 60 and 70 m. an hour, the chassis was lower hung, and the designs of all the bodies were changed in the interests of appearance. The advance in manufacturing skill permitted the new car to be made with tolerances approaching five-thousandths of an inch, whereas in the old Model T a thousandth of an inch had to be the practical limit of accuracy in quantity production. The difficulties attending the putting of the new model into production were largely those of detail, excepting as touching the new methods and more powerful machinery. This involved increasing the power used at the plant from about 100,000 to 250,000 horse power. Aside from the new methods, the work was largely one of detail in changing over single purpose tools to new purposes and in devising new sequences of operations. The cost of this ran into about \$200,000,000 in addition to which was the loss both to the company and its distributors of not producing cars for sale during a period of nearly six months. The expense, however, while large in dollars, due to the magnitude of the operation, was not excessive on a percentage basis, running to less than 20% of the value of the plant, and so much of this was due to the new methods that it is almost impossible to discover exactly how much was due solely to design.

The demonstration, however, has been made that the rigidity of quantity production has been over-estimated, and that the economies to be effected by this method of production are so great as amply to justify it in spite of the costs of introducing new models.

Henry Ford is firmly against paternalism in any form. He believes charity greatly harms those who receive it. Carrying out this thought, he has a trade school for the education of boys with dependents, in which the boys make useful articles. They earn an average of about \$15 a week while receiving their education. The Henry Ford hospital in Detroit, which is open to any one, is conceived on the theory that a hospital should be self-supporting.

All its rooms are precisely alike, all have baths attached, all the fees and services are at a scheduled rate, which is the same to everyone, and all the surgeons, physicians and nurses are on salary and have no financial relations with the patients.

The Ford Motor company also builds a light farm tractor under the same methods and principles as the motor car, and in 1926 was building experimentally all-metal aeroplanes and maintaining for experimental purposes a number of air routes with the eventual aim of putting the Ford principles into aeronautics.

Henry Ford has taken no active part in politics, although he was nominated in 1918 for U.S. senator from Michigan; at the election he was defeated by a small margin. He took no part whatsoever in the campaign. In 1915 he was convinced by certain peace advocates of foreign extraction that it might be possible to end the World War if a sufficient gesture were made. He thereupon chartered a ship and proceeded to Christiania, Norway. Then, convinced that the mission was futile, he returned home. Ford does not believe in war, but he is not an active pacifist. For this encyclopaedia he wrote the article MASS PRODUCTION.

A full account of the origins, theories and practices of the Ford industries is contained in *My Life and Work* (1922), and *To-day and To-morrow* (1926), both by Henry Ford in collaboration with Samuel Crowther. (S. Ca.)

FORD, JOHN (1586–c. 1640), English dramatist, was baptized on April 17, 1586, at Ilstington in north Devon. His father was in the commission of the peace and his mother was a sister of Sir John Popham, successively attorney-general and lord chief justice. John Ford matriculated at Exeter College in 1601 and was admitted to the Middle Temple in 1602. In 1606 he wrote the elegy *Fame's Memorial, or the Earl of Devonshire deceased*, and dedicated it to the widow of the earl, the famous Penelope, formerly Lady Rich. The elegy shows some sympathy for the fate of Essex. Ford's tract of *Honor Triumphant, or the Peeres Challenge* (printed 1606 and reprinted by the Shakespeare Society with the *Line of Life*, in 1843), and the simultaneously published verses *The Monarches Meeting, or the King of Denmarke Welcome into England*, show him in the capacity of a court poet. *The Time Poets (Choice Drollery)*, 1656 suggests that Ford withdrew from literary life in London to his native place; but nothing is known as to the date of his death.

His career as a dramatist probably began by collaboration with Thomas Dekker with whom he wrote *The Fairy Knight* and *The Bristowe Merchant* (licensed in 1624, but both unpublished); and with John Webster *A late Murther of the Sonne upon the Moiker* (licensed in 1624). A play entitled *An ill Beginning has a good End*, brought on the stage in 1613 and attributed to Ford, was (if his) his earliest acted play; whether *Sir Thomas Overbury's Life and untimely Death* (1615) was a play is extremely doubtful; some lines of indignant regret by Ford on the same subject are still preserved. He is also said to have written, at dates unknown, *The London Merchant* (which, however, was an earlier name for Beaumont and Fletcher's *Knight of the Burning Pestle*) and *The Royal Combat*; a tragedy by him, *Beauty in a Trance*, was entered in 1653, but never printed. These three (or four) plays were among those destroyed by Warburton's cook. *The Queen, or the Excellency of the Sea*, a play of inverted passion, printed in 1653 by Alexander Singhe for private performance, was edited by W. Bang (*Materialien zur Kunde d. älteren engl. Dramas*, 13, Louvain, 1906), and is by him on internal evidence confidently claimed as Ford's. Of the plays by Ford preserved to us the dates span little more than a decade—the earliest, *The Lover's Melancholy*, having been acted in 1628 and printed in 1629, the latest, *The Lady's Trial*, acted in 1638 and printed in 1639.

Two works, undoubtedly those most characteristically expressive of his peculiar strength, 'Tis Pity She's a Whore (acted c. 1626) and *The Broken Heart* (acted c. 1629), were both printed in 1633 with the anagram of his name *Fide Honor*. The first is concerned with incest; the tragedy is well worked out, and the characterization vivid. The problem in which Ford was always most deeply interested is here stated at its most acute: the conflict between overwhelming passion and the whole range of restraints which can be opposed to it. *The Broken Heart* has another vivid

and sensational plot, and the pathos, if forced, is effective. The influence of Burton's analysis of the emotions, strong in *The Lover's Melancholy*, is still traceable, but few were so capable of treating them sympathetically, and yet without reckless grossness or extravagance of expression. For in Ford's genius there was real refinement, except when the "supra-sensually sensual" impulse or the humbler self-delusion referred to came into play. *Love's Sacrifice* (acted c. 1630; printed in 1633), is a tragedy of a similar type. *Perkin Warbeck* (printed 1634; probably acted a year later) is a chronicle play; the versification is regular, and the element of buffoonery reduced to a minimum. *The Fancies Chaste and Noble* (acted before 1636, printed 1638) and *The Lady's Trial* (acted 1638, printed 1639) are negligible. There remain two other dramatic works, of very different kinds, in which Ford co-operated with other writers, the mask of *The Sun's Darling* (acted 1624, printed 1657), hardly to be placed in the first rank of early compositions, and *The Witch of Edmonton* (printed 1658, but probably acted about 1621), in which we see Ford as a joint writer with Dekker and Rowley of one of the most powerful domestic dramas of the English or any other stage.

Ford owes his position among English dramatists to the intensity of his passion, in particular scenes and passages where the character, the author and the reader are alike lost in the situation and in the sentiment evoked by it; and this gift is a supreme dramatic gift. But his plays—with the exception of *The Witch of Edmonton*, in which he doubtless had a prominent share—too often disturb the mind like a bad dream which ends as an unsolved dissonance; and this defect is a supreme dramatic defect which has caused the neglect of this author's works in modern days.

BIBLIOGRAPHY.—The best edition of Ford is that by Gifford, with notes and introduction, revised with additions to both text and notes by Alexander Dyce (1869). An edition of the *Dramatic Works of Massinger and Ford* appeared in 1840, with an introduction by Hartley Coleridge. The *Best Plays of Ford* were edited for the "Mermaid Series" in 1888, with an introduction by W. H. Havelock Ellis, and reissued in 1903. A. C. Swinburne's "Essay on Ford" is reprinted among his *Essays and Studies* (1875). The probable sources of the various plays are discussed in Emil Koeppl's *Quellenstudien zu den Dramen George Chapman's, Philip Massinger's und John Ford's* (1897). And see W. A. Mitsa in *Cambridge History of English Literature*, vol. 6 (1910).

FORD, PAUL LEICESTER (1865-1902), American author, was born in Brooklyn, N.Y., on March 23, 1865, the son of Gordon Lester and Emily (Fowler) Ford. His delicate health led to his being privately educated, his tastes being formed largely by long hours spent in his father's library, then one of the finest collections of Americana in the world. The environment of a select social circle and extensive travel on both American continents and in Europe fostered and intensified his cultural interests. At the time of his death, when but 37 years of age, he had gained distinction as an editor, bibliographer, historian and novelist, his edited works and writings totalling more than 70. In American literature he is most famous for his historical novels *The Honorable Peter Stirling* (1894) and *Janice Meredith* (1899). He was shot on May 8, 1902, by his brother Malcolm Ford, who in turn committed suicide.

FORD, THOMAS (c. 1580-1648), English musician, of whose life little more is known than that he was attached to the court of Prince Henry, son of James I. His works consist chiefly of exquisite "Ayres," some of which may be ranked with the best of Dowland. They are set either as solos with lute accompaniment or as unaccompanied four-part songs. The chief collection of his works is entitled *Musike of Sundrie Kinds set forth in Two Books, etc.* (1607).

FORD CITY, a borough of Armstrong county, Pa., U.S.A., on the Allegheny river, 35m. N.E. of Pittsburgh. It is served by the Pennsylvania and (through West Ford city, across the river) the Pittsburgh and Shawmut railways. The population was 5,605 in 1920; and was 6,127 in 1930. Ford City has the largest plate-glass plant in the country, and manufactures also mill machinery, gear wheels and pottery. It was founded in 1887, when Captain J. B. Ford, a pioneer in the plate-glass industry, built a factory here on land bought from farmers. The borough was incorporated in 1898.

FORDE, FRANCIS (d. 1770), British soldier, first appears on the army list in 1746 as captain in the 39th Foot, the first regiment of the king's service to serve in India. Forde became major in 1755, but resigned his commission at the invitation of Clive, to become second in command of the E.I. company's troops in Bengal. Soon after Plassey Forde was sent against the French of Masulipatam. He defeated them at Condore, and was only checked by the guns of Masulipatam itself. After 50 days, Forde, seeing the last avenues of escape closing behind him, ordered an assault at midnight on Jan. 25, 1759. The assault was a brilliant success, in spite of the loss of one-third of the company's troops. The company, however, refused to confirm Forde's commission of lieutenant-colonel. On Nov. 25, 1759, he won a brilliant battle against the Dutch at Chinsurah (or Biderra), and in 1760 received his commission. In 1769 with Vansittart and Scrafton, Colonel Forde was sent out with full powers to investigate every detail of Indian administration. Their ship was never heard of after leaving the Cape of Good Hope on Dec. 27, 1769.

Monographs on Condore, Masulipatam and Chinsurah will be found in G. B. Malleson, *Decisive Battles of India, 1746-1849* (1885; new ed., 1888).

FORDHAM, formerly a village of Westchester county, New York, U.S.A., and now a part of New York city. It lies on the mainland, along the eastern bank of the Harlem river, east of the northern end of Manhattan island. It is the seat of Fordham university (Roman Catholic), founded in 1841 as St. John's college, and since 1846 conducted by the Society of Jesus. In 1907 the institution was rechartered as Fordham university, and now includes St. John's college High school and Grammar school, St. John's college, the Fordham University Medical school (all in Fordham), and the Fordham University Law school. In Fordham still stands the house in which Edgar Allan Poe lived from 1844 to 1849 and in which he wrote "Annabel Lee," "Ulalume," and other poems.

The hamlet of Fordham was established in 1669 by Jan Arcer (a Dutchman, who called himself "John Archer" after coming to America), who in that year received permission from Francis Lovelace, colonial governor of New York, to settle 16 families on the mainland close by a fording-place of the Spuyten Duyvil creek, near where that stream enters the Harlem river. Between 1655 and 1671 Archer bought from the Indians the tract of land lying between Spuyten Duyvil creek and the Harlem river on the east and the Bronx river on the west, and extending from the hamlet of Fordham to what is now High Bridge. In 1671 Governor Lovelace erected this tract into the manor of Fordham. In 1846 it was included with Morrisania in the township of West Farms; and in 1872, with part of the township of Yonkers, was erected into the township of Kingsbridge, which, in 1874, was annexed to the City of New York, and in 1898 became a part of the borough of the Bronx, New York city.

FORD MOTOR COMPANY, manufacturer of automobiles, trucks, tractors and "all-metal" commercial aeroplanes, was incorporated in Michigan on June 16, 1903, with a capital of \$100,000. Of the original 12 stockholders, Henry Ford held 25% of the stock; in 1906 he owned 51%; and a little later, 58½%. In 1919 Edsel Ford, having succeeded his father in the presidency, acquired the remaining 41½% of the stock outstanding. On July 9, 1919 the company was reorganized, under the laws of Delaware, with an authorized capitalization of \$100,000,000. There are 35 branches in the United States, at 32 of which Ford cars and trucks are assembled. There are foreign plants, offices and associated companies in 25 cities throughout the world. The principal manufacturing units are situated in and near Detroit, Mich.; they operate five days a week on eight hour shifts. At the Highland Park and Fordson plants, Mich. (the general offices are located at Fordson) the company operates its own lighting, heat and power plant; fire department; glass factory; wire plant; steel mill; paper mill; large foundry; coke ovens; cement plant; body plant; blast furnaces; telephone and telegraph exchanges; freight and express offices; laboratories; machine shops; wool and cotton textile plants; the Henry Ford Trade school for boys; a motion picture studio; a park and an athletic field; hospital; safety and hygiene

departments; and grocery, drug, shoe and meat stores. In the Detroit district, also, are the engineering laboratory (Dearborn), and the Lincoln Motor Company, a division of the Ford Motor Company, acquired on Feb. 4, 1922. The Ford Motor Company of Canada, Ltd., supplies the trade in the Dominion and in the British empire (except the British Isles). The Fordson Coal Company (incorporated Feb. 1923) owns 120,000 ac. of coal and timber lands in Kentucky and West Virginia. The company also owns more than 500,000 ac. of timber and iron lands in Northern Michigan. Lake freight steamers, also owned by the corporation, carry ore to the Fordson plant from northern Michigan mines, and on the return trips transport Ford coal to Duluth, while seagoing Ford ships carry automobile parts abroad and to company plants on the Atlantic and Pacific coasts. The Stout Metal Airplane Company, a division of the Ford Motor Company, is situated at the Ford airport, Dearborn, Mich., where it builds "all-metal" commercial aeroplanes; and the parent company operates two air lines (one to Chicago, one to Buffalo) over which company freight is carried daily. There is also a railway (Detroit, Toledo and Iron-ton) owned principally by the Ford family, which operates 470 m. of track and connects with the principal transcontinental lines. The company's glass plants have an annual capacity of 25,000,000 sq.ft.; the open-hearth furnaces have a daily capacity of 1,400 tons of steel; and the storage bins at Fordson are capable of holding 2,000,000 tons of iron ore, coke and limestone. The company sold its first car in July 1903, and produced 1,708 cars during its first fiscal year. On Oct. 1, 1908 the first Model T car was manufactured; seven years later number 1,000,000 was produced; on June 4, 1924, No. 10,000,000 was turned out; and on May 26, 1927 No. 15,000,000 was completed, and the manufacture of the Model T Ford car was discontinued to permit a factory change for the production of an entirely new product, the new model A car. The first model A engine was assembled on Oct. 20, 1927 and the car was formally introduced to the public on Dec. 2, 1927. The authorized capital stock of the company aggregates \$100,000,000, of which there was outstanding on Dec. 31, 1926, \$17,264,500. The headquarters are at the Fordson plant, at Fordson, Michigan.

(B. R. D.)

FORDUN, JOHN OF (d. c. 1384), Scottish chronicler. It is certain that he was a secular priest, and that he composed his history in the latter part of the 14th century; and it is probable that he was a chaplain in the cathedral of Aberdeen. The work of Fordun is the earliest attempt to write a continuous history of Scotland. We are informed that Fordun's patriotism was roused by the removal or destruction of many national records by Edward III. and that he travelled in England and Ireland, collecting material for his history. This work is divided into five books. The first three are almost entirely fabulous. The 4th and 5th books, though still mixed with fable, contain much valuable information. The 5th book concludes with the death of King David I. in 1153. Besides these five books, Fordun wrote part of another book, and collected materials for bringing down the history to a later period. These materials were used by a writer in the middle of the 15th century, who is identified with Walter Bower (*q.v.*), abbot of the monastery of Inchcolm. The additions of Bower form 11 books and bring down the narrative to the death of King James I. in 1437. In addition he did not hesitate to interpolate Fordun's portion of the work with additions of his own, and the whole history thus compiled is known as the *Scotichronicon*.

Fordun's work was first printed in Thomas Gale's *Scriptores quindecim* (vol. iii. 1691). This was followed by Thomas Hearne's (5 vols.) edition in 1722. The whole work, including Bower's continuation, was published by Walter Goodall at Edinburgh in 1759. In 1871 and 1872 Fordun's chronicle, in the original Latin and in an English translation, was edited by Wm. F. Skene in *The Historians of Scotland*, the preface of which contains full bibliographical details.

FORECLOSURE, in the law of mortgage, the extinguishment by order of the court of a mortgagor's equity of redemption. In the law of equity the object of every mortgage transaction is eventually the repayment of a debt, the mortgaged property being incidental by way of security. Therefore, although the day named for repayment of the loan has passed and the mortgagor's estate is consequently forfeited, equity steps in to mitigate the

harshness of the common law and will decree a reconveyance of the mortgaged property on payment of the principal, interest and costs. This right of the mortgagor to relief is termed his "equity of redemption." Under the new legislation this estate is no longer merely equitable, but legal. However, this has not changed its attributes, which are that it can only be defeated by the mortgagee taking possession of the mortgaged property and retaining it for 12 years without acknowledging the mortgagor's title, or by the decree of the court ordering the foreclosure of it or the sale of the mortgaged property, or by a sale by the mortgagee under his statutory powers. A foreclosure action is brought by the mortgagee against the mortgagor in the chancery division of the High Court in England claiming that an account may be taken of the principal and interest due to the mortgagee, and that the mortgagor may be directed to pay the same, with costs, by a day to be appointed by the court and that in default thereof he may be foreclosed his equity of redemption. In such an action the court may always order a sale instead of foreclosure. English county courts have jurisdiction in foreclosure actions where the mortgage or charge does not exceed £500, or where the mortgage is for more than £500, but less than that sum has been actually advanced. In a Welsh mortgage there is no right to foreclosure.

(J. A. Sr.)

United States.—The American law on foreclosure is like the English in perpetuating a mortgagor's right to redemption until it is barred by valid foreclosure—typically but not always by way of action in equity—or, if the mortgagee has obtained possession under the mortgage, by the statute of limitations (*q.v.*). But the American law is otherwise highly diversified among the several States, and differs often radically from the English. In part the differences reflect the early American reaction against that flat forfeiture of the mortgagor's land to the mortgagee which was involved in the English conception of mortgage; hence "strict" foreclosure can be had, even by judicial decree, almost nowhere outside of New England. The further differences and divergences arise from the various devices employed in an effort to accomplish the next to impossible, viz., to assure to an unfortunate mortgage debtor some return for the supposed excess in value of his land over the amount of the debt. The practical impossibility arises from two fairly obvious facts: first, that failure to pay off the mortgage commonly proves either that the land mortgaged is a losing proposition, or that conditions (either in general or in real estate) have become such as to make advantageous sale difficult; second, that forced sale is a poor way to make anything realize its value. On the other hand, differences and divergences appear because of the steady pressure of mortgage-lenders and their counsel to invent a quick, sure way to liquidate the debt despite the law.

The first expedient to avoid forfeiture was the substitution of foreclosure by compulsory sale for foreclosure by forfeiture; and, often, a requirement that the premises should be sold in parcels, if possible, so as to save what might be saved. Experience showed, however, that the anticipated surplus for the mortgagor rarely materialized; indeed, the mortgagee is himself commonly forced by lack of competition to purchase at such a sale. Especially through the middle West, where debtor and farmer influence was strong, there then resulted the enactment of a statutory further period of redemption—redemption from the purchaser at the foreclosure sale—the period running from six to 18 months. These provisions operated in part as a sort of poor law, assuring the mortgagor a chance to live undisturbed and make another crop; in part as an opportunity to canvass still further, perhaps under conditions changing for the better, the chances of private sale or of refinancing. But they greatly retarded the realization by the mortgagee, and often decreased his security because of the tendency of mortgagors to exploit the foreclosed premises, or let them run down, during the statutory period of grace. Lenders' efforts to avoid these difficulties have taken the form, chiefly, of incorporating into the mortgage at the outset a power of private sale of the land if default should occur. Where allowed full effect, such a power does away with court and sheriff's costs, and makes foreclosure quick. On the other hand, it is obviously subject to abuse. The States have varied in their attitude toward such informal

foreclosure. Some sustain the power as written, even if it requires no notice to the mortgagor that a sale is intended. Commonly, the sale is required to be by auction. Commonly, too, a fixed number of advertisements of the sale is required, or the mailing of notice to the mortgagor, or both. In some States the statutory redemption period is made to apply even after sale under such a power; and such is the policy of the proposed Uniform Mortgage Act. On the other hand, in some States the restrictions on such powers of sale which are insisted upon in mortgages made directly to the mortgagee seem to be avoided if the transaction is put in the form of a deed to a third person as trustee, to secure the mortgage debt; in which case the security deed of trust comes practically to displace the strict mortgage form. On the whole, it is worth note that even under strict foreclosure by forfeiture, a mortgagor has sometimes a fair chance of realizing something from his "equity," indirectly, since junior mortgagees or judgment creditors are entitled to redeem the premises if he does not—in which case any surplus that may thereafter be realized will wipe out a debt of the mortgagor in addition to the mortgage debt. Under the statutory redemption system this chance is definitely increased: for the junior lienor redeems not by paying off the senior mortgage, but by paying off the price (plus interest and expenses) realized at foreclosure sale. It should further be noted that foreclosure by judicial action (whether resulting by way of sale or of forfeiture) is effective only against those persons having an interest in the premises who are duly served with legal process; whereas informal foreclosure under power of sale, wherever sustained, is free from this danger and expense to the mortgagee. And, finally, that unusually slow, or complicated, or expensive foreclosure of course reacts to raise interest rates on mortgages, even though a legal prohibition exists against charging interest at more than a fixed rate. Hence the net social effect of compulsory delays in foreclosure approaches roughly that of compulsory mutual insurance, in which all mortgage debtors pay a somewhat heavy premium for the partial benefits any of them will derive who are forced to default.

Where the mortgaged premises are so leased as to produce income from the rents, as in the case of apartment or office buildings, foreclosure proceedings are commonly accompanied by the appointment of a receiver to collect the rents pending determination of the suit, and thereby insure against an inadequate price being realized at the sale. The use of the receiver is also common in foreclosing large mortgages, especially those securing bond issues, on corporate assets; and it should be noted that in such cases the sale under foreclosure is never for cash, but for part or all of the bonds secured—it being, in view of the values involved, practically impossible to produce a cash (or even a rival) bidder. The result is a corporate reorganization, in which the original holders of the bonds foreclosed are the dominating factors; the participation of stockholders (who correspond to the mortgagor) in the new corporation being not a matter of right, since they have been foreclosed, but a matter of expediency, since the new capital needed can commonly be collected from them under the inducement of some participation in the new organization. (See also MORTGAGE.)

FORECLOSURE SALE, the sale of property conducted pursuant to the foreclosure clauses of a mortgage upon the property. When property is sold under foreclosure proceedings the proceeds are applied first to the legal expenses of the sale, then to the principal of the debt on account of which the sale was brought about; the remainder, if any, reverts to the mortgagor, i.e., the former owner of the property which was disposed of. (See FORECLOSURE.)

FOREIGN LANGUAGES, TEACHING OF. The revolution that has taken place in the methods of teaching modern languages may be said to date from Viëtor's pamphlet *Der Sprachunterricht muss umkehren* (1886). His doctrines were

largely adopted in the Frankfurter Reformschulen, but it was not till after 1900 that the movement became widespread in England and France. Broadly speaking, the idea of the reformers was to substitute direct comprehension and acquisition of the foreign language for mere knowledge attained through the medium of the mother tongue.

They insisted on oral study at the outset of the language, involving explanations in the foreign tongue itself, on inductive methods of learning grammar and on the use of reading and of free composition in place of formal grammar and translation from or into the foreign language. Hence the introduction of the phonetic script and chart; the employment of gesture; the utilization of pictures, postcards, coins and other *Realien*; and the stress laid on the teacher and not the text-book being the centre of the instruction—the whole idea being to render the classroom a sort of French or German *enclave*, and to make the pupil think as far as possible in the language.

Some of these doctrines were pushed to excess. Certain teachers attempted to exclude the mother tongue entirely from the classroom; others devoted an inordinate time to phonetics or conversation on pictures, and exalted the oral side as the goal of all teaching. Others again neglected the grammar or interpreted their new-won liberty as a right to teach as they pleased, irrespective of their colleagues. To-day, while phonetics (*q.v.*) have been generally accepted in England (though not in France), it is seen that the extent of their use (apart from the chart) may be left to the choice of the teacher. Again new grammar points should be learnt inductively, but the grammar must be systematized and codified. With most pupils grammatical points are more safely explained in English. Due co-ordination of method can usually be secured by the appointment of a head of department. Translation from or into the foreign language is often begun two years before the final examination and not often earlier. As regards the exclusion of the mother tongue, we may take it as an axiom that the cleverer the child the more direct the teaching. Hence with the duller child the aim should probably be to concentrate rather on reading and translation than on composition (free or otherwise). At the extreme end of the scale there are, in the opinion of some experts, a few non-linguistic pupils, who would be more profitably engaged in confining themselves to the mother tongue.

It is probable that the earlier reformers laid insufficient stress on the rapid acquisition of vocabulary, possibly from their dread of rote-work. To-day there is a fruitful tendency to learn by heart, not merely poems but duly prepared prose passages, a practice that is at the back of much of the mastery attained by the French in their own language. Of course such passages need occasional revision. Again, the principle of private reading, which has made such strides in English has been promoted by the formation of class and school libraries, and the practice has been further fostered by the introduction of free study periods in certain schools. Such are the main features of the teaching in English secondary schools, up to the first school examination.

In the central schools, which often prepare their fifth-year pupils for similar examinations, the methods are largely the same, except that in the first year the classes, which are larger, are sometimes divided for conversation, with excellent results. In the advanced courses of the secondary schools, the methods of reading and *lecture expliquée* without translation are largely followed, and essays on literature are written in the foreign language. A burning point is that the universities which conduct the higher certificate examinations appear to prefer answers in English in the literature papers. A possible solution would be the award of extra marks for one question to be answered in the foreign tongue. In the evening schools methods have been modernized, but the need of covering the ground more quickly necessarily limits the use of the leisurely practices of the direct method. (C. BR.)

BIBLIOGRAPHY.—Cloudesley Brereton, *The Organization of Modern Languages* (1905) (a concise statement of the Old and New Schools); *Selected Official Publications—Modern Studies*. Report of the Committee on the Position of Modern Languages in the Educational System of Great Britain: a survey of the past and a forecast on the future (1913); H. G. Atkins and H. L. Hutton, *The Teaching of Modern Foreign Languages* (1920).

UNITED STATES

The attempt to make general the employment of the "direct method," in the teaching of foreign modern languages in the United States had begun to subside before 1909, when it became clear that the method was looked on askance in the best high schools and preparatory schools, and especially in the colleges and universities. Many teachers were well acquainted with foreign languages by ancestry and study abroad; but some could not speak such languages with ease. Also, the increasing desire for travel in Europe, now so manifest, was only beginning to develop. In the universities and colleges, the professors laughed the matter out of court. But agitation over the direct method has borne fruit. Indeed, nearly all the text-books in modern languages bear an imprint, however faint, of the direct method, the influence of which has been beneficial. It is true, furthermore, that the World War gave a strong and perhaps lasting impulse to the study of the spoken language.

Much of the improvement in the teaching of the modern languages came from another source: the introduction of phonetics. This study made its way under two forms: formal or theoretical and experimental phonetics. The first came from both France and Germany, as well as from the English school of Bell and Sweet; the latter came from France. French influence was also seen in the steady extension through the universities and high schools of the international phonetic alphabet, which is now the only one used in the United States in teaching the foreign spoken languages. This alphabet was contrived by Paul Passey (who took hints from Ellis, Bell, Sweet and others) and began to be known in the early '90s.

The science of experimental phonetics was founded by the Abbé Rousselot, whose laboratory at first was in the *Institut Catholique*, Paris, then in the Collège de France. Two or three scholars began research at Harvard university at about the same time as Rousselot in France. The study of experimental phonetics is being given an ever growing importance in the training of teachers of the modern languages in the United States. Courses in this subject are offered in many American universities and colleges, e.g., at the universities of Chicago, Michigan, Ohio State, Utah, at New York university and Washington and Jefferson college. Middlebury college offers in the summer a full list of courses in experimental and theoretical phonetics for teachers. It is said that Boston university is about to equip a laboratory. The University of Havana, Cuba, did so many years ago.

The World War favoured the extension of French in the United States. Combined reports from about 76% of the elementary schools, public and private, and the high schools and academies and from about 89% of the colleges and universities indicate an enrolment during the year 1923-24 of 629,000 students of French, 392,000 of Spanish and 65,000 of German. (R. WE.)

FOREIGN LEGION: *see* LEGION.

FOREIGN OFFICE, in Great Britain, that department of the executive which is concerned with foreign affairs. The head of the Foreign Office is termed principal secretary of State for foreign affairs, and his office dates from 1782. From the Revolution until that time there had been only two secretaries of State: the Southern, administering Home, Irish, American, French, Spanish, Portuguese, Barbary States, Italian, Swiss and Turkish affairs, while the Northern looked after the rest of Europe. In 1782, under Rockingham's administration, the Southern department became the Home Office, keeping the charge of Irish affairs and such colonial business as remained after the secession of the United States, and the Northern department became the Foreign Office, with Charles James Fox as first secretary of State.

The office was then in Cleveland row: the duke of Leeds transferred it in 1786 to the Whitehall Cockpit. In Grenville's time (1791), when the secretary of State was assisted by a staff of two under-secretaries and 11 clerks, it came to small, dark and inconvenient premises in Whitehall, and stayed there until its final move to its present buildings in 1868. The greatest secretaries of State of the 19th century were Canning (1807-09, 1822-27), Castlereagh (1812-22), Palmerston (1830-34, 1835-41, 1846-51) and Salisbury (1878-80, 1885-86 and

1887-92) (*qq.v.*). The most important permanent officials have been Joseph Planta (1787-1847), who controlled the procedure of the office in its early years; Lord Hammond (1802-90, permanent under-secretary 1854-73) and Lord Sanderson (1841-1923, permanent under-secretary 1894-1906), who ruled in middle and late Victorian times respectively; Sir Eyre Crowe (1864-1925, permanent under-secretary 1920), to whom the present organization of the office is greatly due; and Sir Edward Hertslet (1824-1902, librarian 1857-96), who originated the great treaty collections, etc., still associated with his name, and the Foreign Office List.

A qualifying entrance examination for Foreign Office clerks was instituted by Lord Clarendon in 1856, and they are now in almost all respects on an equality with other members of the civil service (*q.v.*), though there are some special provisions as regards languages in the entrance examination taken by them. In 1881 lower (subsequently second) division clerks were introduced, and there is at the present time, in addition to the diplomatic establishment, a non-diplomatic staff to deal with establishment, accounts and other questions of a non-diplomatic character. Women typists were first introduced in the early '90s and had by 1906 taken over all copying work. As a result of the Royal Commission on the Civil Service, 1912-14, the Foreign Office and diplomatic staffs (*see* DIPLOMACY) were made interchangeable, and the "property qualification" (*i.e.*, the necessity of possessing some private means) for the latter was abolished.

The secretary for foreign affairs is the official agent of the Crown in all communications between Great Britain and foreign powers; his intercourse is carried on either through the representatives of foreign States in Great Britain or through representatives of Great Britain abroad. He negotiates all treaties with foreign States, protects British subjects residing abroad, and demands satisfaction for any injuries they may sustain at the hands of foreigners; he, or some person appointed by him with cabinet approval, also represents Great Britain on the Council of the League of Nations.

He is assisted by a permanent under-secretary of State, a parliamentary under-secretary, a deputy under-secretary and two assistant under-secretaries: all of these, except the second, are permanent civil servants.

The Foreign Office at present (1928) is made up of the following departments: (a) *Territorial*. American (North and South America, Liberia, liquor traffic, slave trade); Central (Central Europe, Italy, Balkans, execution of the peace treaties); Eastern (Turkey, Persia, Hejaz); Egyptian (Egypt, Sudan, Abyssinia); Far Eastern (China, Japan, Siam, opium); Northern (Russia, Afghanistan, Poland, Scandinavia, Finland, Baltic States); Western (France, Spain, Portugal, Holland, Belgium, Switzerland, League of Nations, arms traffic). (b) *General*. Treaty (international law, foreign marriages, nationality, diplomatic privilege, ceremonial); Consular (under the administrative control of the Department of Overseas Trade, for which *see* below; dealing with the consular service [*see* CONSULS] throughout the world); News (press, wireless news service); Dominions Information (inter-imperial relations as affecting foreign countries); Communications (telegrams, king's messengers); Passport office and passport control department; Chief Clerk's department (estimates, finance, establishment, fabric); Library (books, custody of correspondence, preparation of memoranda, facilities and information, legalization of documents); registry, a sub-department of the Library (arrangement, indexing, despatch and custody of current correspondence). There is a legal adviser, whose post was created in 1878, now with three assistants, and (temporarily) an historical adviser.

British trade abroad has always been the joint concern of the Foreign Office and the Board of Trade (*q.v.*), and until 1917 there was a Commercial department of the Foreign Office to act as the channel between British diplomatists and consuls abroad and the Board of Trade at home. In that year the Department of Overseas Trade was formed, with its own permanent head and parliamentary under-secretary, and it now occupies a quasi-independent position between the two older offices, having especially close relations with the Consular department of the Foreign Office, and

dealing also with British trade in the dominions and colonies.

The World War naturally caused a vast expansion in the work of the Foreign Office. Its most important manifestations were the Contraband Department (the Foreign Office side of the Ministry of Blockade), with its subsidiary licensing and statistical branches, and an organization for the promotion and control of British propaganda, until this activity was handed over to a Ministry of Information created *ad hoc*.

Despatches, telegrams, letters, etc., are registered on receipt,¹ and the registry clerks attach to them previous correspondence on the same subject, or papers affording precedents or analogies. They are then sent to the appropriate department for minuting. Minor matters are settled within the departments, while those of greater importance pass on upwards to the under-secretaries, and to the secretary of State himself: the latter, in the weightiest matters of all, will consult his colleagues of the cabinet, and keep the King informed and if necessary obtain His Majesty's approval.

The salaries of officials of the Foreign Office, and the diplomatic, commercial, diplomatic and consular services will be found in the Foreign Office List, published annually by Messrs. Harrison and Sons, Ltd.

The numbers employed in the Foreign Office and connected departments are (June 1928):—

Foreign Office	Permanent	Temporary	Total
Men	240	81	321
Women	129	120	249
Passport Office			
Men	8	179	187
Women	10	10
Department of Overseas Trade			
Men	291	48	339
Women	38	85	123

See *Foreign Office List*, annual; *Cambridge History of Foreign Policy* (1923), vol. iii., ch. viii. (S. GA.)

FOREKNOWLEDGE: see FREE WILL.

FOREL, FRANÇOIS ALPHONSE (1841-1912), Swiss geographer, was born at Morges on Lake Geneva, on Feb. 2, 1841. He was trained for and practised the medical profession, but his life-interest was found in the lake on whose shore he lived. The fruits of his studies were embodied in *Le Léman* (3 vols., 1892-1902). On the science of limnology his standard work is *Handbuch der Seenkunde* (1901); in this connection his investigations of the previously mysterious movements of lake-waters known as seichs call for special notice. Among other researches of Forel's those in seismology and upon Swiss Alpine glaciers are noteworthy. He died at Morges on Aug. 7, 1912.

FORELAND, NORTH and SOUTH, two chalk headlands in Kent, England, on the Strait of Dover. The North Foreland forms the north-east corner of the Isle of Thanet, and South Foreland is 3 m. N.E. of Dover. Both form bold cliffs, with one lighthouse on the North Foreland (51° 22½' N., 1° 27' E.) and two on South Foreland (51° 8½' N., 1° 23' E.). Another Foreland is on the north coast of Devonshire, on Bristol channel, 2½ m. N.E. of Lynmouth.

FOREORDINATION: see FREE WILL.

FORESHORE, that part of the seashore which lies between high and low water mark at ordinary tides. In Great Britain it is ordinarily and prima facie vested in the Crown, except where it may be vested in a subject by ancient grant or charter from the Crown, or by prescription from which a grant may be presumed. The chief acts showing title to foreshore are, taking wreck or royal fish, right of fishing, mining, digging and taking sand, seaweed, etc., embanking and enclosing. There is a public right of user in that part of the foreshore which belongs to the Crown, for the purpose of navigation or fishery, but there is no right of passage over lands adjacent to the shore, except by a particular custom. So that, in order to make the right available, there must be a highway or other public land giving access to the foreshore. Thus it has been held that the public have no legal right to trespass on land above high-water mark for the purpose

¹These receipts were 68,000 in 1913 and 146,500 in 1927. The number of out-going despatches (including letters, telegrams, etc.) is considerably larger than this.

of bathing in the sea, though if they can get to it they may bathe there (*Blundell v. Catteral*, 1821, 5 B. & Ad. 268). There is no right in the public to take sand, shells or seaweed from the shore, nor, except in certain places by local custom, have fishermen the right to use the foreshore or the soil above it for drawing up their boats, or for drying their nets or similar purposes. Improvements made by a tenant under the Landlord and Tenant Act, 1927, must not infringe the rights of the public. As to registration of land comprising foreshore, see c. 21 of 1925, s. 97. (For foreshore protection see COAST PROTECTION.)

In the United States the foreshore generally belongs to the State in which it lies except in some States, as Maine, Massachusetts, New Hampshire and Virginia, where it belongs to the owner of the upland. The State may make such reasonable regulations as to its use by the public as are not inconsistent with the provisions of Federal law.

See S. A. Moore, *History of the Foreshore and the Law relating thereto* (1888); H. J. W. Coulson and U. A. Forbes, *Law of Waters* (1902).

FORESTALLING, in English criminal law, the offence of buying merchandise, victual, etc., coming to market, or making any bargain for buying the same, before they shall be in the market ready to be sold, or making any motion for enhancing the price, or dissuading any person from coming to market or forbearing to bring the things to market, etc. See ENGROSSING.

FOREST CITY, a borough of Susquehanna county, Pa., U.S.A., in the Moosic mountains, 20m. N.E. of Scranton. It is served by the Delaware and Hudson, the Erie and the New York, Ontario and Western railways. The population was 6,004 in 1920 (29% foreign-born white) and was 5,209 in 1930 by the Federal census. Anthracite mining and farming are the chief occupations of the region. The borough was incorporated in 1888.

FORESTERS, ANCIENT ORDER OF: see FRIENDLY SOCIETIES.

FOREST LAWS, the restrictive laws applicable to land converted by exercise of the royal prerogative into a "forest," in which game was preserved. But, whereas an offender against the ordinary game laws was punishable by the courts of common law, an offender against forest laws was punishable in special courts. Trials took place in the swainmote, held three times a year, where freeholders within the forest did suit and of which the verderers were the judges, on charges presented by the foresters in the woodmote, held every 40 days. Judgment, however, only took place in the justice seat, held by one of the two chief justices for the forest every three years. The land within a forest might be owned by anyone, but rights of ownership were so restricted by the forest laws that constant complaint of hardship was made by landowners in and near the forests. The forest laws were among the grievances which united the barons and people against John. They were dealt with by Magna Carta but the first forest charter was Henry III.'s, in 1217, by which land afforested under Richard and John became *purliieu*, subject to forest law as it affected non-owners of the land, but (subject to certain protection for the king's wild beasts) disforested for the landowners. Charles I. revived the forest laws to extort revenue, but in 1640 parliament confined forests to their limits as in 1623. Since the Revolution the forest laws have fallen into complete disuse.

See Manwood, *On the Forest Laws* (4th ed., 1717).

FOREST PARK, a city of Cook county, Ill., U.S.A., 12m. W. of Chicago, served by the Chicago, Aurora and Elgin, the Chicago Great Western and the Soo Line railways. The population was 10,768 in 1920 and was 14,555 in 1930. It is a residential suburb, and also has a variety of manufactures, including cedar chests, mouldings, cement posts, celluloid and mica products. Floriculture is an important industry.

FORESTS AND FORESTRY. The meaning of the word "forest" has undergone many changes with the change in economic, political and social conditions of the people. Originally the word "voorst" or forest designated the segregated property of the king or leader of the tribe. Toward the end of the eighth century, it referred to all the royal woods in which the right to hunt was reserved by the king, but other rights, such as the right to cut

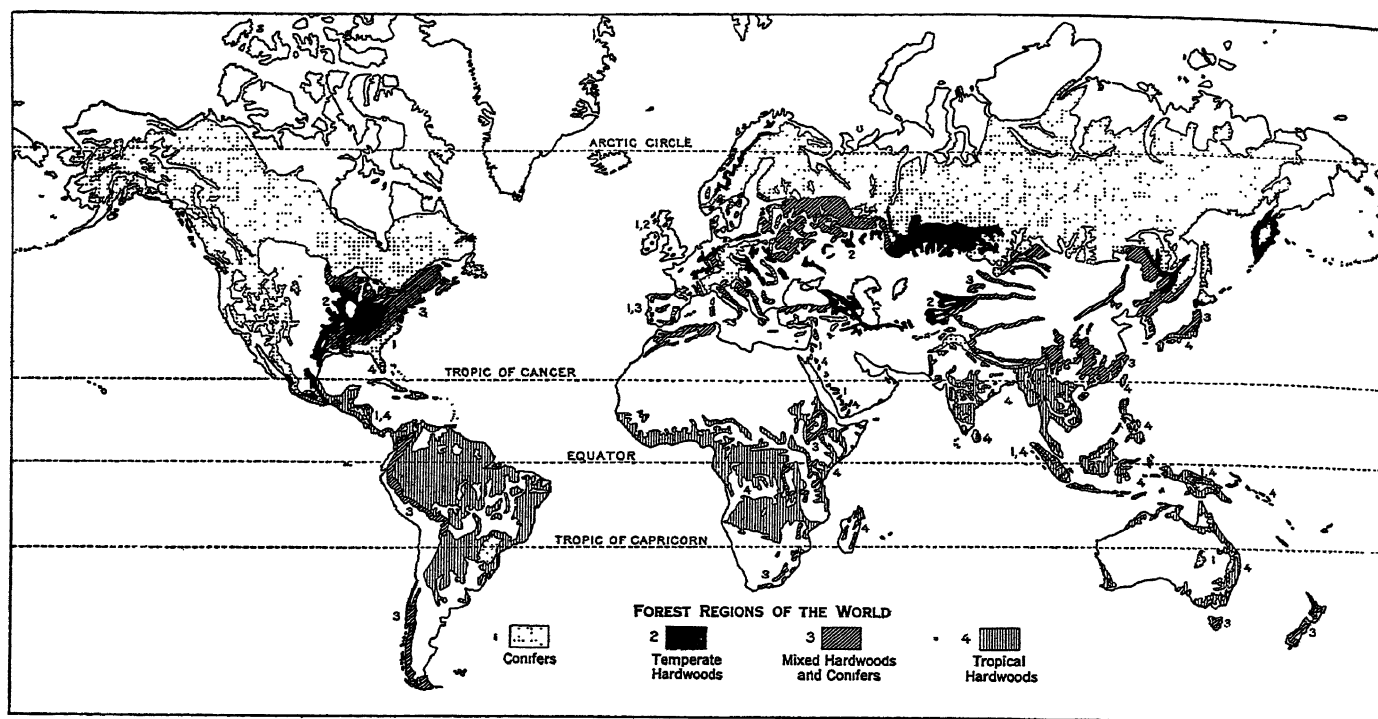

FIG. 1

wood, clear for agricultural use or pasture, remained free to all. Toward the end of the ninth century, "forest" meant a large tract of land, including woods as well as pastures and whole villages, on which not only the rights to the chase were reserved to the king but also all other rights, often even the activities of the persons themselves living on it, were restricted. "Forest" was a legal term, applied to a large tract of land or district governed by special "forest laws," with the royal prerogative—"the right to hunt"—as the basis. The forests of Dean, Windsor, Epping and Sherwood, and the New Forest in England, made famous by legend and history, were such legal districts set aside by the Norman kings for their pastime. With the decadence of the regal prerogative, the old legal meaning wore away, and "forest" came to mean a natural condition, land covered by wood growth as contrasted to prairies and plains, meadows and field.

In modern times as the economic aspect of forests as a source of wood material came more into the foreground, "forest" came to mean a woodland, whether of natural growth or planted by man, designated as an object of man's care for the growing of timber and other forest products. With the advance of plant science, better understanding of the nature of the forest, its life history, and its relation to climate, soil and other environmental factors, the forest is conceived as a biological entity—a plant society governed by definite natural laws, the knowledge of which is basic to intelligent management of the forest as an economic resource. *The present conception, then, of a forest is that of a plant society of arborescent and shrub species, which has both an economic and biological significance.* Its economic significance lies in the production of timber and other forest products. Its biological significance lies in its effect upon climate, streamflow, protection of the soil from erosion, and in the mutual relationships that exist between the trees in the forest.

Rôle of Forests in Human History.—The relations between forests and man are manifold and varied throughout the course of human progress from the primitive stage to the present highly developed economic organization. Forests have had an important effect on the distribution of mankind over the earth's surface. They have deeply affected the spiritual and religious life of the tribes living within them or nearby. They have been a source of raw material, indispensable to the economic development of the human race.

At the dawn of human history, the forests did not offer favour-

able conditions for the settlement of primitive man; on the contrary, they were always an element inimical to the spread of mankind over the earth.

Only a few traces of prehistoric man are found in densely forested regions. The chief memorials of Neolithic man in Britain are found on the moorlands, which at that time appeared as islands of open, habitable land, above the vast stretches of swamp and forest. The first cradle of human civilization was not a primeval forest. The first great nuclei of population, the seats of the earliest recorded civilizations both in the Old and in the New World, originated in arid regions, at best only scantily covered with forests. In the Old World, the Egyptian, Babylonian, Assyrian and Phoenician civilizations arose in hot and dry regions. Similarly, in the New World, the nations which developed a high degree of civilization were those in the arid regions of Mexico and Peru—the Aztecs and the Incas.

Barriers to Travel.—Forests have acted as barriers to human colonization in all parts of the world. It took the American colonists about 200 years to reach the crest of the Appalachians. The expansion of the Inca empire from the high plateaus of Peru and Bolivia eastward was limited by the impenetrable forests of the headwaters of the Amazon river. The Romans, the greatest colonizers of ancient times, were forced to stop in their expansion and empire building at the boundaries of the dense, virgin German forests. Later, the successive waves of nomadic tribes which moved from the eastern prairies westward—Huns, Magyars, Avars, and the like—broke up when they reached the barrier of primeval forests. The routes of migration in western and central Europe were largely determined by the openings in the primeval forest.

The difficulty of travel in the forests made them play during early stages of human culture, the part of territorial boundaries. Forests formed political boundaries in the ancient nations of central Europe. According to Grimm, the German word, *mark*, which means boundary, was originally a synonym of *Waldland*, or woodland. Even today, among the more primitive races, forests still serve as political boundaries. When the forests did not afford a safe defence in themselves, then the natives resorted to the construction of additional barriers, which, primitive as they may seem to us at present, probably proved very effective for those times.

As a source of fuel, the forest has exerted a most powerful

influence upon human progress. The polar boundary of human settlement in the interior of northern Asia and North America closely coincides with the northern limit of forest vegetation. In Alaska, the northern timber limit reaches as far as 67° N.; in Labrador, it ends at 52° N., or 15 degrees farther southward. The Indian settlements follow closely these fluctuations of the northern timber line.

Cultural Influence.—The forest left a deep impression upon the soul of primitive man. The forest figures largely in the religious beliefs of primitive races all over the world. With many primitive peoples, trees are considered to be the abode of the souls of the dead. The Hindu philosopher, Tagore, in his book on *The Realization of Life*, describes very vividly the part which the Indian forests have played in the development of Indian civilization and philosophy. The influence of the forest upon the spiritual life of man is not confined, however, to primitive tribes. The folklore of North American Indian, Teuton and Slav is permeated with the atmosphere and joy of the forest.

Landscape painting has drawn much inspiration from the forest. The forest is a great natural structure from which architecture has often borrowed its form. The trunks of the trees gave rise to the pillars of stone. The bending branches served as models for arches, and foliage and flowers provided the ornaments adorning many works of man. Music has also found inspiration in the dense forest.

Domination of Primitive Man.—At the low stages of development, man is dominated by the forest. Primitive man, possessing crude stone implements only, found but few parts of the earth's surface which were neither too barren nor too heavily forested to be suitable for his habitation. When, however, the arts of life advanced, man learned to overcome forest and other natural difficulties. At a certain stage there begins, therefore, a reverse influence, namely, that of man upon forest, the penetration of forests by man.

The primitive nations could not change to any marked degree the forest cover of the earth. Their tools were too crude and, moreover, their activities were rarely concentrated at the same place for any length of time, because their mode of life was largely nomadic. The dense forests of central Europe did not give way before the efforts of the Romans or the ancient Teutons. Only in the middle ages, beginning with the era of Charlemagne, when there arose an imperative need for more room, did the Teutons succeed in clearing any large areas of the dense forest. This clearing was not the work of individuals, but was the result of many concentrated and persistent efforts on the part of the religious and knightly orders.

Forest Settlements.—The earliest settlements in the forest were comparatively small. In the earlier settlements, the surrounding forest served as a supplementary source of food for the primitive agriculturist. The cultivation of small parcels of cleared land was supplemented by grazing of stock in the oak or other adjoining forest. The forest also furnished acorns as food for animals and even man, while the wild animals provided meat and hides.

As the gathering of wild plants is displaced gradually in the course of economic evolution by the regular production of cultivated crops, grazing supersedes the hunting of game. As an intermediate stage from hunting to stock raising, there is often domestication of animals, as, for instance, the breeding of foxes in a state of semi-domestication, or the raising of bees. In the primitive horticulture of the primeval forests, it was customary to cut down the trees in the portion of the forest destined for cultivation, then to burn all the wood or at least the branches and underbrush. The ashes served as fertilizer; the ground was broken, and the seed, shoots, or tubers were planted. The peasants of eastern Russia, as well as some agricultural colonists in South America, burn the forest and cultivate the ground for some years, merely to abandon it and repeat the same process every 10 or 15 years.

Use of Forest Products.—Extensive as this form of agriculture may be, it in itself would not have been sufficient to have reduced the forested area of the world to its present size. It is the increased needs for the products of the forest itself, par-

ticularly its timber, that has made the heaviest inroads upon it. Next to food, wood has been one of the most important factors of civilization, particularly at the time when iron, brick and other structural materials were either unknown or little used. In the early stages of economic development, the forests furnished man with fuel for overcoming the rigours of winter cold. It furnished fuel also for metal working, and a number of secondary products, such as charcoal, pitch, ashes, gallnuts, some of which were more widely used in the past than they are now. At a higher stage of civilization and with the development of means of communication and transportation, the products of the forest are no longer merely the means with which to satisfy immediate needs; they become commodities of widespread use far beyond the forest boundary. Many industries, which were dependent upon wood as fuel, found their location in the forest. Thus, the occurrence in the same area of forests and mineral deposits gave rise to metallurgy and the art of glass making. In France about the 15th century, before the invention of high ovens, metallurgists and glass makers resided in the forest. In the Middle Ages, an entire forest population, employed exclusively in industries growing out of the use of wood, lived in the forests of France. Kilns, charcoal furnaces, forges, glass furnaces, limekilns, and establishments where wood was worked up gave a peculiar aspect to the forests of that time. In the Ural mountains of Russia, the metallurgical industry is still closely connected with the forest, from which the necessary charcoal is obtained. The forests of the eastern United States were once extensively used for charcoal making, in connection with the iron industry.

Rôle of Navigable Rivers.—The penetration of the forests and the development of forest industries have been greatly favoured by rivers. Water courses, penetrating forest regions, are the natural means of access and with their banks constitute the first zone of attack on the phalanx of the forest. This was the case in Europe; the Rhine and its tributaries formed the principal routes by which extensive openings could be made in the German forests. The same was true in Italy during the Roman epoch, when the Aniene, the Liri and the Chiana served as means of transporting wood from the Apennines, and wood from the Alps reached Rome by way of rivers and the ocean. The vast territory included between Hudson bay and the Saskatchewan river was revealed to missionaries and fur dealers—*voyageurs, coureurs de bois*—by way of the St. Lawrence river. The development of the lumber industry in the United States and Canada in the early days would not have been so rapid had it not been for the proximity of the New England forests to the coast and the large number of navigable streams. Where forests lack navigable rivers, they remain intact for a long time.

Influence on Pioneer Character.—The battle against the forest has left a deep influence upon the life and character of man. Many of the specific pioneer traits of the original settlers in the United States may be traced to their battle against the forest on the slopes of the Alleghenies to provide a place for settlement. The hazardous work of hewing farms out of the virgin forest bred a race of men of sturdy character and of enormous enterprise and self-reliance. In the United States, this pioneer life of the settler in combating the forest has produced leaders, such as Lincoln, Henry Clay, Jackson, Benton, Cass and scores of others, who for over half a century helped to shape the destiny of their country. The entire ancient history of Sweden may also be reduced to the same struggle with the primeval forest. It is the colonization of the forests of northern Russia that has developed in the Russian people the necessary qualities which enabled them to spread to Siberia and take possession of it. If, of all the present nations, the Anglo-Saxons, Teutons and the Russians display the great colonizing capacity, may it not be attributed largely to their original impenetrable forests, in the struggle with which they have developed the persistence and unrelenting energy required for pioneer work?

Forest Restoration Imperative.—As man progressed, his capacity for mastering the forest and other natural obstacles increased manifold with the result that over a large part of the world the forest is now conquered. It is not only conquered, it

is exterminated beyond any possible chance of natural recovery. It has now become important to civilization to preserve and restore the forest instead of struggling against it.

The disappearance of the forest has not done away with the use of wood by the present civilization; on the contrary, it has only intensified it. The clearing of the forest, aside from depriving the thickly settled and highly civilized countries of timber needed for their industries, has produced other bad economic and social effects. The stripping of the mountain forests resulted in the occurrence of torrents, in erosion, in floods and in a general change in the régime of streams. The disappearance of the forest has also affected the climate and with the growth of industrialism has resulted in the physical deterioration of a large part of the population. Much of the forest land that has been cleared on mountain slopes, sandy plains or rocky hills, has proved unsuitable for agriculture and has failed to provide room for permanent settlement.

The products of the forest have now become altogether too valuable and no civilized nation can afford forest devastation on a large scale without regard to the future possibilities of the land. Practically all of the civilized countries of the world have now come to realize that there is a point where further clearing of the forest, no matter how dense the population may be, proves detrimental to progress itself. Europe reached that point several centuries ago.

The lesson of the older countries found a reaction also in countries still having abundant forests. In practically the entire civilized world, a new economic force has now been born—a general appreciation of the value of the forest and a movement toward the introduction of rational forest management.

Forests and Climate.—Observations continued for many years in different parts of the world establish with certainty the following facts with regard to the influence of forests upon climate:

The forest lowers the temperature of the air inside and above it. The vertical influence of forests upon temperature extends in some cases to a height of 5,000 feet. The *yearly* mean temperature at equal elevations and in the same locality has invariably been found to be less inside than outside a forest. In a level country this difference is about 0.9° F. It increases, however, with altitude, and at an elevation of about 3,000 ft. is 1.8° F. The *monthly* mean temperature is less in the forest than in the open for each month of the year, but the difference is greatest during the summer months, when it may reach 3.6° F, while in winter it does not often exceed 0.1° F. The *daily* mean temperature shows the same difference, but to a greater degree. During the hottest days the air inside the forest was more than 5° F cooler than that outside, while for the coldest days of the year the difference was only 1.8° F. The temperature of the air within the forest is, therefore, not only lower but also subject to less fluctuation than in the open.

In tropical and subtropical regions, the influence of the forest upon the temperature of the air is the greatest. Forests influence the temperature of the soil in almost the same way as they do that of the air, except that the differences are greater in the case of soil. The forest soil is warmer in winter by 1.8° F and cooler in summer by 5.4° to 9° F than soil without a forest cover, and this holds true for a depth of as much as 4 feet. In the spring, and especially in the summer, the forest soil is cooler than that of open land. In the autumn and winter, however, it is warmer, but the degree of difference is always less than in summer. The soil under the forest may remain soft when the ground in the open is frozen hard to some depth. If it does freeze, it is to a depth of one-half to less than three-fourths of that in the open.

Forests and Rainfall.—In the summer the relative humidity of the air is higher in the forest than in the open. This difference is usually between 4 and 10%, but in some places may be as much as 12%. In regions of heavy snow there is practically no difference in the relative humidity during the spring, when the snow melts. The evaporation of water in the forest from the soil under forest cover is considerably less than in the open. The wind movement in the open is greater than in the forest.

Of the total amount of precipitation that falls over the forest only 83% reaches the ground under the forest in the winter and

70% in the summer. The temperature of the trunks, branches, and twigs is always lower than the temperature of surrounding air. This is true for day and night, winter and summer.

This difference in the temperature causes the formation of dew on the branches. The difference in the temperature of the air in the forest and open field is the cause of air currents from the forest into the field and reverse. These movements facilitate the formation of dew and fogs over fields adjoining forests. In the spring and autumn, these fogs save the fields from early frosts and in the summer from damage by hail. Repeatedly and in different countries it has been observed that forests prevent hail falling over the fields adjoining the forest. Coniferous forests have the greatest effect in deflecting hail storms. Statistics collected for 20 years, from 1877 to 1897, by a company insuring against hail, confirm the fact that forestless regions are subject to hail storms very frequently, while in forested regions hail storms are of very rare occurrence.

Although there is no complete agreement as to whether forests actually increase precipitation, most observations tend to show that forests do increase both the abundance and frequency of local precipitation over the areas they occupy. The excess of precipitation, as compared with that of adjoining unforested regions, amounts in some cases to more than 25%.

The influence of mountains upon precipitation is increased by the presence of forests. The influence of forests upon local precipitation is more marked in the mountains than in the plains.

Forests in broad continental valleys enrich with moisture the prevailing air currents that pass over them, and thus enable larger quantities of moisture to penetrate into the interior of the continent. The destruction of such forests, especially if followed by weak, herbaceous vegetation or complete barring of the ground, affects the climate, not necessarily of the locality where the forests are destroyed, but of the drier regions into which the air currents flow.

While the influence of mountain forests upon local precipitation is greater than that of forests in level countries, their effect upon the humidity of the region lying in the lee of them is not very great.

Forests and Waters.—The hydrological rôle of forests in level countries differs from that of forests in hilly or mountainous regions.

In *level* country, the forests constitute an effective means of draining and drying up swampy lands, the breeding places of malaria and fever-carrying insects. The reforestation of the Landes, Sologne, the Pontine marshes, and a hundred other examples prove this. It draws moisture from a greater depth than does any other plant organism, thus affecting the unutilized water of the lower horizontal strata by bringing it again into the general circulation of water in the atmosphere, and making it available for vegetation. While it lowers to some extent the subterranean water level, it has no injurious effect upon springs, since these are practically lacking in the level countries with horizontal geological strata where its lowering influence has been chiefly noted. It refreshes the air above it and increases the condensation of moisture carried by the winds, thus increasing the frequency of rains during the vegetative season.

In *hilly* and *mountainous* country, forests are conservers of water for streamflow. Even on the steepest slopes they create conditions with regard to surface run-off such as obtain in a level country. Irrespective of species, they save a greater amount of precipitation for streamflow than does any other vegetable cover similarly situated. They increase underground storage of water to a larger extent than do any other vegetable cover or bare surfaces. The steeper the slope, the less permeable the soil, and the heavier the precipitation, the greater is this effect. In the mountains, the forests, by breaking the violence of rain, retarding the melting of snow, increasing the absorptive capacity of the soil cover, preventing erosion and checking surface run-off in general, increase underground seepage, and so tend to maintain a steady flow of water in streams.

Forests and Soil Erosion.—One far-reaching influence of the forest upon streamflow lies in its ability to protect the soil from

BY COURTESY OF THE U.S. FOREST SERVICE

FIRE LINE METHOD OF CONTROLLING FOREST FIRES

1. Fire line along ridge of forested mountain in Southern California. The cleared space is broad enough to enable forest officers to check the spread of fire from either side of the mountain
2. Building a fire break or fire line in a forest in the western United States. Caterpillar tractor with blade grader is used over cleared section. The preservation and cultivation of forests are now in charge of State and Federal bureaus

washing. The forest is the most effective agent for protecting soil from erosion because (1) the resistance of the soil to erosive action is increased by the roots of the trees, which hold the soil firmer in place, and (2) at the same time the erosive force of the run-off is itself reduced because the rate of its flow is checked, and its distribution over the surface equalized. Erosion has a bearing on the height of flood waters in the rivers, since the sediment carried by the rivers and the coarser detritus brought down by mountain streams often increase stream volume to such an extent that the height of the water is raised far beyond the point it would reach if it came free of detritus and sediment.

When the channel of a stream has become filled with waste material, even a slight rainfall will cause a flood, while if the channel were deep it would have no perceptible effect upon the height of water in the stream. The filling of mountain streams with waste not only increases the frequency of floods but causes the streams to assume the character of torrents.

Floods, which are produced by exceptional meteorological conditions, cannot be prevented by forests, but without the mitigating influence of the latter, they are more severe and destructive.

Forests and Public Hygiene.—The hygienic influence of forest air is due to its great purity. Forest air is free of smoke, particles of dust, and injurious gases, which are found in the air of cities. All kinds of bacteria are less numerous in the forest air than in the outskirts, generally from 23 to 28 times less. The foliage of the trees acts as a kind of filter and retains the dust and other particles which are contained in the air that passes over a forest. The bacteria retained on the leaves are then readily killed by exposure to the sun.

The former idea that the forest air contains more oxygen and less carbon dioxide has not been confirmed. The amount of oxygen exhaled by a forest is insignificant and is offset by the increase of carbon dioxide, resulting from the decomposition of organic matter in the floor of the forest. Ozone, which is usually absent from the air of cities, has been found in quantities in the forest, just as it is found in the mountains and on the sea shore. Hydrogen peroxide was found also to exist in minute quantities in the air of the forest, but what its hygienic importance may be is not known.

The soil of the forest was found to contain less albuminoid matter and salts suitable for bacterial growth. Moreover, the humus produced by the growth of trees is inimical to pathogenic bacteria, which up to the present time have not been found in the soil of forests.

It was shown that the soil has an important bearing upon the spread of cholera and typhoid fever. In India, it is claimed that villages surrounded by forests are never visited by cholera, and troops are removed to barracks built in the forest to arrest the disease. Huffer confirms this by the statement that the town of Haguenau in Alsace, surrounded by a dense forest nearly 50,000 ac. in extent, was always free from the epidemics of cholera which in the last century attacked several times the other towns in the same district. Forests by affording protection against prevailing cold and humid winds make life more healthy and bearable in districts subject to such winds.

The advent of the automobile and the opening of remote forests with highways have made them accessible to large masses of people and enhanced tremendously their recreational value. In some localities of Canada and the United States, the recreational value of the forests exceeds their value as a source of raw materials.

Occurrence of Forests.—Forests grow naturally only where there is present a certain minimum of heat and moisture. According to Heinrich Mayr, forests can grow only where the average temperature during the four months of the vegetative period (in the northern hemisphere—May, June, July and August, and in the southern—November, December, January and February) does not fall below 50° F and where during the same four vegetative months the precipitation is above two inches.

The warm ocean currents (the Gulf stream and Japan current, *Juro Sivo*) raise the northern limit of the forest from 57° north latitude to 65°. The northern coast of America, Greenland,

the north of European Russia and Siberia are forestless because of lack of heat. The south-eastern extremity of South America, central Africa, Sahara, Arabia, Persia, Gobi, the west coast of central Africa, and the interior of Australia are treeless because of lack of moisture.

In many parts of the earth's surface, where no natural forest occurs, forests, however, can be established artificially. The young trees require certain favourable conditions of heat and moisture for their development during the early years of their life. Once such conditions are afforded them in artificial reforestation by means of irrigation and cultivation, they themselves create later under the forest canopy conditions for their further development.

Kinds of Forests.—The forests of the world may be classified broadly into three main groups, *conifers* (softwoods), *temperate hardwoods*, and *tropical hardwoods*. For the world as a whole, conifer forests (pines, spruces, firs, hemlocks, larches, cedars, sequoias and cypresses) occupy 35.4% of the forest area; temperate hardwoods (oaks, maples, birches, poplars, etc.), 16%; and tropical hardwoods (mahogany, fustic, logwood, balsa, rosewood, teak, cedrela, ebony, etc.), 48.6%. Fig. 1.

A most striking fact, and one of great economic significance, is that 95% of the conifer forests upon which the world depends for its construction material and 89% of the temperate hardwood forests are in the north temperate zone. This zone, including Europe, most of Asia, and North America, and the north coast of Africa, has almost three-fourths of the world's population and consumes an even greater share of the timber used in the world. The tropical hardwoods are confined to the tropical and adjacent subtropical regions of the earth, which have less than one-fourth of the population.

Original Forest Area.—In prehistoric times and also according to tradition and the written record of the earliest historic times, forests occupied a much larger proportion of the earth's surface. As a result of land clearing and forest fires, that followed in the wake of forest exploitation, much of the original forest has disappeared.

With the exception possibly of China, the greatest change has taken place in Europe, where of a total land area of nearly 2½ billion acres, only one-third, or 774 million acres, remains in forest. Almost two-thirds of this, or about 500 million acres, is in European Russia and Finland, and only 275 million acres in the rest of Europe. In Great Britain 95% of the original forest is gone; in France, Spain, Belgium, Italy and Greece, from 80 to 90% of the original forest has been destroyed; while Sweden and Finland are the only countries with half of their forests left. The forest area of Norway has been reduced 2 million acres from 1875 to 1907. In European Russia the privately owned forests

shrank between 1880 and 1913 by about 25 million acres. In Serbia the forest area has decreased 12½% from 1889 to 1904. In the United States of North America, the original forest has shrunk more than 40% in the course of three centuries. Canada's productive forest area is decreasing at the rate of about 3 or 4 million acres a year. Large areas of forest have been cleared in the more populous regions of Africa and South America, and even in the less developed regions the process is going on slowly but steadily. The World War still further accelerated this process. The forests in the occupied territories have been greatly depleted, as, for instance, in Belgium. Great forest devastation occurred also in northern France and Poland. The demands of war caused over-cutting in many other central European countries.

Present Forest Area.—The present forest area in round figures is about 7½ billion acres, which is 22% of the land area, exclusive of the polar regions. This is 4.35 acres per capita for the population of the world. The area of actually productive forest, however, is probably one-fourth less than this amount, or 5½ billion

FROM ZON AND SPARHAWK, "FOREST RESOURCES OF THE WORLD" (MCGRAW-HILL)

FIG. 2.—DIAGRAM SHOWING DIVISION OF FOREST AREA OF THE WORLD AMONG THE CONTINENTS

acres, which is 16% of the land area, and 3.2 acres per capita.

The present distribution of the forests among the six grand divisions of the earth's surface is shown in fig. 2.

The extent of forests in individual countries, together with the ratio of forests to total land area of each country and the relation of forest area to population, are given in Table I.

TABLE I.—*Forest Areas of the World*
Europe

Country	Forest area	Ratio of forest to total land area	Forest area per 100 inhabitants
	Acres	Per cent	Acres
Austria	7,600,000	37.7	120

Political Control of Forest Wealth.—If the forests of the colonies, protectorates and dependencies are added to those of their mother countries, we obtain a picture of the political control of the forests of the world (fig. 3).

Russia has the most extensive forests and the British empire is a very close second. Each has more than one-fifth of the world's forests. Brazil and the United States come next, and these four countries together have nearly two-thirds of the forest land of the world. The remaining one-third is divided among about 50 countries. It is interesting to note that Great Britain, France, Belgium and the Netherlands, which together have but 0.4% of the world's forests, control more than 30% in their colonies and dependencies.

World Production and Consumption of Wood.—In spite of the fact that this is the "age of coal, iron, steam and electricity," wood still forms the basis of modern civilization. The world production and consumption of wood amounts to approximately 56 billion cu.ft., which is an average of 32 cu.ft. per capita, or a cut of 7.5 cu.ft. per acre of forest. Almost half of it, or nearly 26 billion feet, is sawtimber, and 30 billion feet is fire wood.

As populations grow and as living standards rise and human wants become more complex, timber consumption increases, in spite of the extensive and growing use of substitute materials, and in spite of the tendency to utilize wood more economically. No sooner do substitutes take the place of wood in some particular place than new uses are found. A century ago railroad ties, railroad cars and telegraph poles had not been thought of. Now, American railroads alone use more lumber in a year than was required to meet all the needs of the 30 million people living in the United States in 1860. Newsprint and other products of wood pulp, automobiles, phonographs, radio cabinets and many other

the rates of increase in these and other important countries, the world's timber needs may be expected to double within approximately 50 years.

North America, with one-twelfth of the world's inhabitants, uses nearly half of all the timber and more than half of all the sawtimber. Its per capita consumption (188 cubic feet) is five times as great as that of Europe, and if the tropical countries south of the United States, all of which have a very low consumption, be left out, it is six and one-half times that of Europe. Australia, South America and Europe use about equal amounts of wood per capita (39 cubic feet). The proportion of sawtimber to total amount of wood used, however, is quite different, being only one-ninth in South America, two-fifths in Australia and over one-half in Europe. Asia and Africa use comparatively small amounts of wood (9 and 5 cubic feet, respectively), and most of what they do use is for fuel. (See Table II.)

The Amount of Wood Grown in the World.—The total quantity of wood grown in the world each year is roughly estimated at about 38 billion cubic feet. If this increment were spread evenly over the whole forest area, it would amount to only 5.1 cu.ft. per acre. It is apparent that the present annual growth of 38 billion cu.ft. is not replacing the present annual cut of 56 billion cubic feet. As a matter of fact, the amount of growth each year represents the growth of only a small part of the forest. Vast areas of virgin tropical forests, as well as much of the virgin forests of the temperate regions, must be left out of the calculation, because in their present condition there is no net growth in them. Twenty-two billion cubic feet, or more than half of the growth that is actually taking place at the present time, is in the forests of Europe, a large proportion of which are under management for the production of timber. If all the forests of the world were placed in a growing condition, even without much care of them beyond a moderate amount of protection against devastation, they could produce annually at least 355 billion cu.ft. of wood, or nearly 50 cubic feet per acre. Under intensive management the growth would be much greater.

The World Trade in Wood.—The total value of the world's export of all forest products, before the World War, amounted to about \$1,063,400,000 or 5.6% of the total foreign trade of the world. The foreign trade in forest products during the last decade before the war showed a tendency to rapid increase, exceeding in some items the general rate of increase of the world trade. The entire world export from 1899 to 1911 increased 80% in value. The trade in wood pulp, at the same time, showed an increase of 330%; the trade in rubber and other chemical products of tropical forests showed even a greater rate of increase.

Of the total trade in forest products, sawn, round, planed and split timber formed about 44% of the value of all exported forest products. Rubber, balsams and similar forest by-products, made up about 26% of the export; paper and wood pulp, and cellulose, 20% of the world's foreign trade; wooden furniture, toys and similar mechanically manufactured wood products, 8%; the export of tropical cabinet woods, such as mahogany, ebony and others, 2 per cent. This did not include the trade in many edible products of the forests, such as vegetable oils, nuts, etc. Of the total volume of trade in wood products, about 80% are composed of conifers, principally for construction and paper pulp. The temperate hardwoods, used for staves, railroad ties, furniture, finish, cabinet work and other special purposes, constitute about 18%, while tropical hardwoods are only 2% of the total.

The Crux of the World's Timber Supply.—With about 5½ billion acres of actually productive forest area in the world, much of it bearing heavy stands of virgin timber and with a possible annual growth many times the world's present timber requirements, it would seem that there is enough timber to last for centuries. This would be true if all kinds of wood were equally capable of satisfying human wants. There are about 2,645,000,000 acres of softwoods or conifer forests in the world; some 1,204,000,000 acres of temperate hardwoods or broad-leaf forests, and 3,638,000,000 acres of tropical hardwoods. Although the softwoods and temperate hardwood forests form only one-half of the total forest area of the world, 91% of all the timber

FROM ZON AND SPARHAWK, "FOREST RESOURCES OF THE WORLD" (MCGRAW-HILL)

FIG. 3.—CHART SHOWING THE POLITICAL CONTROL OF FORESTS

articles requiring large quantities of wood, all have come into extensive use within a generation.

In Great Britain timber consumption has increased much more rapidly than has the population. In 1915 with the total national consumption nearly six times as great as in 1851, the requirements per capita were almost four times as great. Even in France with a practically stationary population, timber consumption was slowly increasing until 1914; that of Germany more than doubled within the century; in the United States at least seven times as much lumber is now used in a year as in 1850, and even the per capita rate of consumption is considerably larger. Judging from

cut and used in the world comes from the softwood and temperate hardwood forests of the northern hemisphere, and only 9% from the tropical hardwoods. The softwood forests are furnishing three-fourths and the temperate hardwoods one-fifth of the construction timber of the world. The temperate hardwoods, in addition, supply three-fourths of all the firewood.

The amount of standing timber in the tropics is far greater than the amount remaining in the temperate regions, yet until recently, the tropical forests have played a minor part in supplying the world's timber. Until recently there has been prevalent an idea in the northern hemisphere that the tropical forests are composed chiefly of cabinet woods, such as mahogany, ebony, boxwood and satinwood, or dyewoods, such as logwood and brazilwood, and similar kinds of hard, heavy, deeply colored wood, possibly suitable for furniture and a few special uses but not for construction. Recent explorations have dispelled considerably this belief. It is known now that there are many excellent construction woods, equal if not superior to the woods of conifers for use in the tropics because more resistant to decay and termites. It will be a great many years, however, before the tropical forests are able to supply a large part of the world's requirements for wood, if they ever can. Before they can do this, they must be opened up by adequate systems of cheap transport and adequate supplies of efficient labour must be at hand, both to construct the transportation facilities and to exploit the timber. This means a fairly large population of races accustomed to or easily adaptable to carrying on woods work on a large scale.

Another difficulty which must be overcome is the nature of the tropical forests themselves. They are mostly composed of a very great variety of species, intermingled in the greatest confusion, and can be exploited economically only if practically all the important species can be utilized. Only a few of them are now known on the world's markets, and those are chiefly cabinet woods, of which the supply and possibilities for utilization are more or less limited. In order to dispose in the general market of large quantities of the less known timbers, particularly those which are more suited for common lumber and construction, a long process of education and economic pressure will be necessary to overcome the established habits and idiosyncrasies of the consuming nations. Meanwhile, the timber requirements of the tropical countries themselves will doubtless grow as their industries develop, while their most accessible forests will probably be destroyed or rendered less productive, just as has happened in other regions passing through a corresponding stage of development.

The crux of the world's timber supply problem, during the next two or three generations at least, lies in the available supplies of softwood and temperate hardwood forests, especially of the softwoods.

Softwood Supplies.—The softwood forests are confined to the cooler regions of the northern hemisphere. Although some conifers occur in the southern hemisphere, such as the Paraná pine of Brazil, the alerce, pino, and cipres of Chile, the cedar and yellow-wood of Africa, the pines of the East and West Indies, and the kauri and other softwoods of New Zealand, they do not occur in sufficient abundance, however, to become important beyond their own regions. The present growth of conifer timber is not quite 80% of the present cut. It is evident, therefore, that the forest capital is being steadily depleted.

The principal conifer regions are (1) North America, including Canada, the United States, and the Sierras of Mexico; (2) northern Europe and central Europe; (3) Asiatic Russia, Manchuria, and part of Japan.

In *Canada* the total amount of accessible merchantable sawtimber is estimated at approximately 61½ billion cubic feet and of pulpwood 52 billion cubic feet. The forests are being destroyed from two to two and one-half times faster than they are being grown. Taking an annual drain upon the forests of 5 billion cu.ft., the accessible stands of virgin forests will be exhausted in about 25 years. Canada uses now three-fifths of the lumber she produces and as her population grows her lumber requirements may be expected to increase also. The Canadian supply of pulpwood, although large, is already giving so much concern that the exportation of unmanufactured wood is subject to restriction in several provinces.

In the *United States* roughly only 385 billion cubic feet of softwoods of sawtimber size remain. Softwoods comprise two-thirds of the 13 billion cu.ft. of large timber used annually and more than three-fourths of the sawed lumber. Nine-tenths of the paper consumed in the United States is made of softwoods. The United States now exports about 2 billion board feet of softwood timber annually, or about 7% of the amount cut. Almost as much is imported, however, so that the net export is only about *one per cent* of the production. To meet its present requirements, the United States is cutting about four times as much as it grows each year. *Alaska* has great reserves of virgin timber in her coast forests and when fully developed will contribute large quantities to the world trade.

Mexico has about 20½ billion cu.ft. of pine in her mountainous forests at an elevation between 7,000 and 10,000 feet. These

PREVENTABLE DESTRUCTION OF FORESTS BY FIRE

1. Pine forest on fire in the Klamath National Forest, California. Coniferous trees are especially subject to destruction by fire on account of their resinous sap
2. Fighting fire in the Wasatch National Forest, Utah. By widening the fire lines, and keeping them clear of brush and debris, the fire is prevented from spreading beyond the lines
3. Fire fighters in Lassen National Forest, California, 1927. A corps of men is stationed in each large forest reserve for this and for other services, such as reforestation
4. Pine trees in the Arapaho National Forest, Colorado, after passage of fire. This fire spread through the crowns of the trees and was not extinguished until it had burned its way to the forest floor
5. Gullies near Oakland, Fayette County, Tennessee; representative example of soil erosion resulting from the removal of the forest cover. Large areas on the Appalachian region are thus denuded of their original soil
6. A mixed stand of Norway and jack pine, 53 years old, prior to thinning. Chippewa National Forest, Minnesota

BY COURTESY OF THE U. S. FOREST SERVICE

mountainous forests have so far been able to withstand the primitive hand-lumbering methods and ox and mule transportation over poor roads or pack trails. They will melt away, however, quickly before the attack of modern steam power logging and milling equipment backed by rail connections to the consuming centres of Mexico and the United States. Mexico may, therefore, in the near future export considerable quantities, at least for a few decades. Her own requirements are bound to grow, however, and at present she imports a great deal of pine lumber.

However, *Europe* as a whole is barely self-sufficient in meeting its needs for softwood timber. Western Europe depends upon imports to meet a large part of its present needs in softwoods. Just before the World War Great Britain imported 97% of the timber she consumed; France, Germany, Italy, Belgium, and the Netherlands imported approximately 30, 47, 65, 77 and 82% respectively. The only European countries that have any prospect of increasing their output of softwood timber for any considerable period or even of continuing to export at the present rate are Sweden, Finland, Russia, and possibly Czechoslovakia and Yugoslavia. Should Russia increase her own home consumption of timber, as is apparently inevitable with the rising standard of living of her population, Europe may be compelled to seek additional sources of softwood supplies from North America or Asia.

In *Asia* the only country exporting on a fairly large scale at present is Japan. Within a few years even Japan will need all her timber and may have to import some in addition. In Asia only western and eastern Siberia are reputed to have enormous supplies of virgin softwood timber. Siberian forests, however, are largely unexplored, and little is known of their actual condition. According to rough estimates of the potential production of her forests, Siberia can furnish to the world market about 6 billion cu.ft. of softwood timber a year, which is double the quantity now entering international trade and 30% of the world's consumption of conifer sawtimber.

Of the vast forest area of *South America* only 5% is composed of conifers. The bulk is in the Paraná pine region of southern Brazil and adjacent portions of Argentina and Paraguay. Southern Chile, Paraguay and northern Argentina, the heaviest wood-consuming districts of South America, may be expected to take practically the entire output of Paraná pine. At present the entire region produces only from one-third to one-half as much softwood timber as Argentina alone buys from the United States and Canada. The other South American countries depend upon the northern hemisphere for a considerable portion of their construction timber, although most of them have extensive forests of tropical hardwoods.

Africa, although it possesses extensive equatorial forests, does not contain enough softwood timber to furnish even the small amounts required locally for construction purposes. African countries import nearly all of their softwoods from Europe and North America.

In *Australia*, the softwood supply is inadequate for local needs. Much pine, fir and spruce lumber is imported from North America, Europe, and north-eastern Asia. The small area of softwood forest in New Guinea and the other islands of the Pacific is insignificant from the standpoint of the world supply.

Lord Lovat, after a survey of the softwood forests of the world, arrives at the conclusion that, except in Russia, the main softwood virgin timber reserves will be exhausted before very long, and Europe will have to depend more and more on timber raised by the agency of man; that the United States shortage is likely to come more quickly than the European one; that the more the American supply becomes centred in the Pacific Coast states, the greater is the probability of the industrial states of north-eastern America coming into European markets for sawtimber in the same way that they do now for pulpwood; and, finally, that as the United States consumes over 13 billion cu.ft. of softwoods, as opposed to a total European consumption of 9 billion cu.ft., the United States advent into European markets will have an important bearing upon European prices.

There are, however, several hopeful factors in the situation. The potential growth of the existing conifer forests, if they could

be put under careful management, is probably three times the present cut. In most countries, possessing coniferous forests, the appreciation of their value and economic significance is becoming general and will undoubtedly prove a powerful factor in maintaining them permanently in a condition to supply the world's needs.

Temperate Hardwood Supplies.—Like the conifers the temperate hardwoods are confined chiefly to the northern hemisphere and are located fairly close to consuming centres. They as a rule occupy the better soils of the more favourably situated lands and, therefore, have been progressively destroyed to make room for cultivation. The large old timber has been depleted even to a greater extent than that of the softwoods.

Europe has still extensive areas of hardwood forests and even exports special kinds, such as the oak of Poland and Slavonia. On the whole, however, the consumption of hardwoods in Europe greatly exceeds the production, so that there is a net annual importation of about a hundred million cubic feet.

In *Asia*, Japan exports small quantities of oak. Walnut and other hardwoods are exported from Asiatic Turkey and the Caspian region. Siberia has about 30%, by area, of the temperate broad-leaved forests of the world. Except in the Far East, however, they consist of fairly light stands of aspen and birch, much of it valuable chiefly for firewood or pulp and not to be compared with the oak, ash, birch, maple, beech and other hardwoods of the United States and Europe.

In *North America* the United States now has the largest supply of temperate hardwoods. The other North American countries have no surplus over their own needs. For many years the United States has been the largest exporter of high grade hardwoods. Now the original stand of approximately 250 billion cu.ft. of merchantable hardwoods has dwindled to about one-fourth of that amount and is being further depleted at the rate of over two billion cu.ft. a year. The United States uses nearly four billion cu.ft. of hardwood timber a year, exclusive of firewood, or almost two-thirds of the entire world consumption of temperate hardwood timber.

In the temperate region of the southern hemisphere including *southern Chile* and *Argentina*, portions of *New Zealand* and *Tasmania*, and the *high mountains of South America* and *Africa*, are only relatively small quantities of valuable hardwood timber, little or none of it available for export.

The outlook for future supplies of hardwoods, however, is probably better than for softwoods, because woods adapted to the same uses can be got from the tropical forests, though they may cost considerably more.

Forestry as a Science.—Forestry, which is the science and art of growing timber, is a child of necessity. As long as forests are plentiful, they are exploited without thought for their renewal. It is only when forests become scarce and their complete exhaustion threatens that efforts are put forth toward their perpetuation. Forests, unlike mines, can be renewed. They are the product of the soil and, therefore, can be regrown like any other crop. The science underlying the growing of timber crops is, therefore, nothing but a branch of general plant science. Like agriculture, forestry is built on the foundations of plant science, soil science, and the science of the atmosphere (meteorology). The science of forestry comprises all the knowledge regarding forest growth,—its component parts, the life history of the species and their behaviour under varying conditions, their development and dependence upon natural conditions, the forest's retroactive influence upon those natural conditions—in short, the forest's place in the economy of nature and man.

Forestry, however, has characteristics which set it apart from other plant sciences. Forestry, unlike horticulture or agriculture, deals with wild plants scarcely modified by cultivation. Trees are also long-lived plants; from the origin of a forest stand to its maturity there may pass more than a century. Forestry, therefore, operates over long periods of time. It must also deal with vast areas. The soil under the forest is as a rule unchanged by cultivation, and most of the cultural operations applicable in arboriculture or agriculture are entirely impracticable in forestry. Forestry is thrown back upon the same resources for maintaining the soil

fertility as nature does. Forestry must make the forest itself conserve not only the fertility of the soil but even improve it. It does it by maintaining a certain density of stand, by regulating the density of the crowns, by creating an undergrowth, by controlling the composition and the form of the forest. The mechanical tilling of the soil is assigned to the roots of the forest trees and the fauna of the soil. The fertilizing of the soil is assumed by the trees in the stand. They, by shedding their foliage, supply the soil with a continual reservoir of material from which humus is made. The drying out of the soil is also accomplished with the aid of the stand itself. Forestry as a science must learn how to use the forest itself as an apparatus for the accumulation, conservation and intelligent use of moisture in the soil. The relation between forest and soil is much closer and deeper in forestry than in agriculture. Aside from the soil, the forester must know also the subsoil to a much greater extent than the agronomist because the roots of the forest trees often go very deep into the ground.

Forests are largely the product of nature, the result of the free play of natural forces. Since the forester had to deal with natural plants which grew under natural conditions, he early learned to study and use the natural forces affecting forest growth. In nature, the least change in topography, exposure, depth of soil, etc., means a change in the composition of the forest, in its density, in the character and humidity of the ground, and so on. For these reasons, forestry, although it is based like agronomy chiefly on plant physiology, is more closely related to oecology because intelligent management of the forests must be based on a thorough understanding of the relationships which exist between forests as living plants and their environments. Forestry may even be defined as applied oecology.

Forestry as an Art.—Like agriculture forestry is concerned in the use of the soil for crop production. As the agriculturist is engaged in the production of *food crops*, so the forester is engaged in the production of *wood crops*, and finally both are carrying on their art for the practical purpose of revenue. If forestry as a science furnishes us the reason for forest practice—the *why*, forestry as an art teaches us *how* to apply our knowledge to the growing of timber. Two principles underlie the practice of forestry as opposed to forest exploitation: (1) the *continuity* of timber production or *sustained yield*; this means that the cut in the long run should always equal the growth in the forest; and (2) that the *harvesting* of the forest and its *renewal* should be nearly *identical operations*. In other words, the conditions for the regrowth of the forest should be provided for in the manner in which the forest is cut. The specific methods of accomplishing this naturally vary with the character of the forest, the species involved, the soil, and the kind of forest products to be grown.

The entire field of forestry, both theoretical and applied, may be subdivided as follows.

I. Forest Production

Scientific Basis

1. Forest botany.
Dendrology, systematic and biologic (anatomy, plant physiology, mycology, etc.)—forest geography—biological characteristics of the species.
2. Forest oecology.
Tree societies—forest types—sites—soil physics—soil chem-

Application

1. Silviculture.
Methods of growing timber crops and influencing their progress.
2. Forest protection.
Forest fires—forest pathology—forest entomology—climatic injuries—grazing—game—etc.

BY COURTESY OF THE U.S. FOREST SERVICE
FOREST RANGERS' LOOKOUT, IDAHO
From such points of vantage the Forest Service keeps watch to protect the national forests of the United States against fire and trespass

I. Forest Production—continued

Scientific Basis—continued

- istry—meteorology and climatology with reference to forest growth.
3. Forest zoology.
4. Forest mathematics.
Algebra—trigonometry—analytical geometry—graphics—statistical or biometric analysis.

Application—continued

3. Forest mensuration.
Methods of ascertaining volumes and rates of growth of trees and stands and determining yields.
4. Forest surveys.
Area and boundary—topography—ascertaining forest conditions—establishing units of management and administration.
5. Forest valuation and finance.
Ascertaining money value of forest property and financial results of different methods of management.
6. Forest regulation.
Preparing working plans—determining cutting budgets—organizing for continuous revenue and wood production, and the utilization of secondary forest products, such as naval stores, forage, fish and game.
7. Forest administration.
Organization of forest services; business practice and routine, including forest law and business law applicable to forest practice.

II. Forest Utilization

Scientific Basis

1. Timber physics.
Structure—physical and chemical properties of wood, factors affecting them—diseases, faults and abnormalities.

Application

1. Wood technology.
Application of wood in the arts—requirements—working properties—use of minor and by-products—preservation.
2. Harvesting of timber crops.
Methods of harvesting, transporting and preparing for market.

III. Forest Economics

Scientific Basis

1. Political economy.
The place of forests and forestry in the economic life of the nation.
2. Land economics.
3. Forest statistics.
Areas: forest conditions—distribution—composition—ownership. Products: trade—supply and demand—prices—substitutes.
4. History of forestry.

Application

1. Forest policy.
Formulating rights and duties of the states—forest legislation—state forest administration—education.

Forestry is not a new science. Systematic forest management existed already in France and Germany at the beginning of the 18th century and crude prescriptions as to the proper use of forests even date back to the 14th century. In Germany the first courses in forestry were organized between 1770 and 1780 at the universities of Leipzig, Jena, Giessen, and Berlin. In France the first forest institute was opened in 1824 at Nancy. To-day every civilized country has at least one forest school and often several. In the United States alone there are over 22 forest schools. Both Europe and the United States have now a net of forest experiment stations at which, as at the agricultural experiment stations, the science of forestry is being advanced and new and better methods of forest management being constantly developed. Yet, if one considers that a mere 10 or 15% of the world's forests is being handled as a renewable, continuously productive resource, while an additional 15 or 20% is more or less protected from destruction, but still regarded as a timber mine, and the greater part, from 65 to 75%, receives no care whatever, forestry is barely on the threshold of its greatest development.

ernment Printing Office, Washington, D.C., 1927); Raphael Zon and W. N. Sparhawk, *Forest Resources of the World* (New York, 1923), 2 vol.; Augustine Henry, *Forests, Woods, and Trees in Relation to Hygiene* (1919); C. L. Peck, *Forests and Mankind* (1929). (R.Z.)

FOREY, ELIE FREDERIC (1804–1872), marshal of France, was born at Paris on Jan. 5, 1804, and entered the army from St. Cyr in 1824. He took part in the earlier Algerian campaigns, and became captain in 1835. At the revolution of 1848 Cavaignac made him a general of brigade. He took an active part in the *coup d'état* of Dec. 2, 1851, and Napoleon III. made him a general of division shortly afterwards. He held a superior command in the Crimean War, and in the Italian campaign of 1859 distinguished himself at Montebello (May 20). In 1862 Forey commanded the French expeditionary corps in Mexico, with the fullest civil and military powers, and captured Mexico city in May 1863, receiving as his reward the marshal's bâton. Marshal Forey retired in 1867, and died at Paris on June 20, 1872.

FORFAR, royal, municipal and police burgh, parish and county town of Forfarshire, Scotland. Pop. (1931) 9,660. It lies at the east end of the Loch of Forfar in the valley of Strathmore, and is 13 m. N. by E. of Dundee by road and 21½ m. by the L.M.S.R. It is on the same company's main line to Aberdeen, which has a branch to Brechin. The court house is one of the principal buildings. The hall contains portraits by Raeburn, Romney, Opie and others. Peter Reid, a merchant, gave the Reid hall and the public park. The burgh, with Montrose, Arbroath, Brechin and Inverbervie (the Montrose group of burghs), returns one member to parliament. On a gravel bank in the north-west of the Loch of Forfar stood a castle sometimes used as a residence by Margaret, queen of Malcolm Canmore. The staple industries are linen and jute manufactures and bleaching.

Forfar is at least as old as the time of Malcolm Canmore, for the first parliament after the defeat of Macbeth met in the castle, which stood on a mound north of the town. The parliaments of William the Lion, Alexander II. and Robert II. also assembled within its walls. The town was created a royal burgh by David I., and was burnt about the middle of the 13th century. Edward I. captured the castle, but in 1307 Robert Bruce seized and destroyed it, its site being now marked by the town cross. The town sided with Charles I. during the Civil War, and Charles II. presented the cross to it out of regard for the loyalty shown to his father. The witches' bridle, a gag to prevent witches from speaking whilst being led to execution, is still preserved in the county hall. One mile to the E. lie the ruins of Restennet priory.

FORFARSHIRE or **ANGUS**, an eastern county of Scotland, bounded north by the shires of Kincardine and Aberdeen, west by Perthshire, south by the Firth of Tay and east by the North Sea. The island of Rossie and the Bell Rock belong to the shire. The name Angus was officially adopted in 1928.

In the most northerly section many rugged masses of the Grampians are found; this belt is succeeded by Strathmore, or the Howe of Angus, a fertile valley, 6 to 8 m. broad, continuing the Howe of the Mearns, and running south-westwards till it enters Strathearn, to the south-west of Perth; then come the Sidlaw hills and a number of isolated heights, which sink to the plain of the coast and the Firth. The mountains are all in the northern division and belong to the Binchinnin group (sometimes rather inexactlly called the Braes of Angus) of the Grampian ranges. The highest point is Glas Maol (3,502 ft.) on the summit of which the shires of Aberdeen, Forfar and Perth meet, and summits over 2,000 ft. are numerous. This northern division, consisting of the Silurian and older metamorphic rocks of the Highlands, with a great granite mass rising through the schists between Cairn Bannock and Mount Battock, is separated by a fault, extending from near Edzell to Loch Lintrathen, from the Old Red Sandstone rocks of the rest of the county. In these, volcanic tuffs and lavas are interbedded in the sandstones and conglomerates. The Sidlaw Hills—the greater part of which belongs to Perthshire—reach 1,493 ft. within Forfarshire. None of the rivers is navigable. The Isla (45 m.) rises in Cairn-na-Glasla, and enters the Tay. Near Bridge of Craig is the fall of Reekie Linn (70 ft.). Near Airlie castle are the cascades called the Slugs of Auchrannie.

The North Esk, formed by the confluence of Lee and Mark at Invermark, after a south-easterly course of 28 m. enters the North sea 3 m. N. of Montrose. It gives the title of earl of Northesk to a branch of the Carnegie family. The South Esk (48 m.) rises in the Grampians near Mount Fafernne and not far from its source forms the Falls of Bachnagairn; it reaches the North sea at Montrose. It supplies the title of earl of Southesk to another branch of the Carnegies. Lintrathen (circular in shape and about ¾ m. across), north of Airlie Castle, supplies Dundee with drinking water. The glens of the Forfarshire Grampians are beautiful, and rich in botanical interest; they include Glen Isla, in which are the ruins of Forter castle, destroyed by Argyll in 1640, Glen Clova, Glen Esk and Glen Prosen.

History.—In the time of the Romans the country now known as Forfarshire was inhabited by Picts, and there are remains of weems, or underground houses. Traces of Roman camps and stone forts are common, and there are vitrified forts at Finhaven, Dumsturdy Muir, the hill of Laws near Monifieth and at other points. The battle in which Agricola defeated Galgacus is supposed to have occurred in the Forfarshire Grampians (A.D. 84); the Northumbrian King Egfrith and the Pictish king Burde fought near Dunnichen in 685, the former being slain; conflicts with the Danes took place at Aberlemno and other spots; Elpin king of the Scots was defeated by Aengus in the parish of Liff in 730; at Restennet, about 835, the Picts and Scots had a bitter encounter. There is some doubt whether the county was named Angus, its title for several centuries, after a legendary Scottish prince or from the hill of Angus to the east of the church of Aberlemno. It was early governed by hereditary earls and was made a hereditary sheriffdom by David II. The first earl of Angus (by charter of 1389) was George Douglas, illegitimate son of the 1st earl of Douglas by Margaret Stuart, countess of Angus in her own right. On the death of the 1st and only duke of Douglas, who was also 13th earl of Angus, in 1761, the earldom merged in the dukedom of Hamilton. Precisely when the shire became known by the name of the county town, Forfar, has not been ascertained, but probably the usage dates from the 16th century. Among old castles are the roofless square tower of Red castle at the mouth of the Lunan; the tower of the castle of Auchinleck; the stronghold of Inverquharie near Kirriemuir; the castle of Finhaven; the two towers of Edzell castle; the ruins of Melgund castle, fairly complete; the small castle of Newtyle, and the square tower and gateway of the castle of Craig.

During the Glacial period the ice travelled south-eastward across Strathmore and over the Sidlaw hills; abundant evidence of this transporting agent is to be seen in the form of morainic deposits, the most striking of which is the great transverse barrier of Glenairn in the valley of the South Esk, half a mile in length and about 200 ft. high. Relics of the same period are found round the coast in the form of raised beaches at 100, 50 and 25 ft. above the present sea-level.

Agriculture.—The principal wheat districts are Strathmore and the neighbourhood of Dundee and Arbroath. Oats, however, are the chief crop; barley and turnips are grown, and potatoes on the higher ground near the coast. The northern belt has been turned into sheep walks and deer forests. The black-faced sheep are the most common in the mountainous country; cross-bred sheep in the lowlands. Though it is their native county (where they date from 1808), polled Angus are not generally reared, but shorthorns are a favourite stock and Irish cattle are imported for winter-feeding. Excepting near towns there are no dairy farms. Pigs and Clydesdale horses are reared.

Other Industries.—The staple industries are the jute and flax manufactures. Flax-spinning, linen and jute manufactures, and bleaching are carried on extensively at Dundee, Arbroath, Montrose, Brechin and Kirriemuir. Dundee is famous for jams and confectionery, and here and at Arbroath there are engineering works, iron-foundries, boot and shoe factories, breweries and distilleries. Shipbuilding is carried on at Dundee, Arbroath and Montrose. Sandstone quarries employ many hands and the deep-sea fisheries of Montrose are important. The netting of salmon at the mouth of the North Esk is profitable. Fish is cured at

Montrose, and paper is made at Brechin.

Communications.—The L.N.E.R., entering from the south by the Tay bridge, follows the coast north-eastwards, sending off at Montrose a branch to Bervie. An L.M.S.R. line runs up Strathmore to Forfar, Guthrie, Dubton and Marykirk; it reaches Dundee from Perth by the shore of the estuary of the Tay, and sends branches from Dundee to Kirriemuir via Monikie and Forfar and to Alyth Junction via Newtyle, while a short line from Dubton gives it touch with Montrose.

Population and Government.—The population was 270,190 in 1931, when 762 spoke Gaelic and English and 5 Gaelic only. The chief towns are Arbroath (pop. in 1931, 17,637), Brechin (6,838), Carnoustie (4,806), Dundee (175,583), Forfar (9,660), Kirriemuir (4,755), Monifieth (2,984) and Montrose (10,196). Forfarshire returns one member to Parliament. It is a sheriffdom and there are two resident sheriffs-substitute at Dundee and courts are held also at Arbroath, Brechin, Forfar and Montrose.

FORFEITURE, in law, the termination of a right; the loss or liability to the loss of property in consequence of an offence or breach of contract; it is also applied to the property of which the party is deprived.

Under the common law, conviction and attainder on indictment for treason or felony was followed not only by forfeiture of the life of the offender, but also by forfeiture of his lands and goods. In the case of treason all the traitor's lands of whomsoever holden were forfeited to the king; in the case of felony, including *felo-de-se*, or suicide (*q.v.*), the felon's lands escheated to his immediate lord, subject to the king's right to waste them for a year and a day. This rule did not apply to lands held in gavelkind in the county of Kent. The goods of traitors and felons (*q.v.*) were forfeited to the king. The desire of the king and his officers to realize the profits of these forfeitures was one of the chief motives for instituting the circuits of the king's justices throughout England; and from time to time conflicts arose from attempts by these justices to extend the law of treason—under which the king levied all the forfeitures—at the expense of felony, in which the lord of the felon benefited by the escheats. As regards theft, the king's rights overrode those of the owner of the stolen property, until, in the reign of Henry VIII., provision was made for restitution of the goods to the owner if he prosecuted the thief to conviction. It was common practice for persons anticipating conviction for treason, or felony, to assign all their property to others to avoid the forfeiture; and in some instances the accused refused to plead to the indictment and endured the *peine forte et dure*, until death supervened, to avoid these consequences of conviction. The royal rights to forfeitures arising within particular areas were frequently granted by charter to corporations or individuals. In 1897 the courts had to interpret such charters granted to the town of Nottingham in 1399 and 1448. All forfeitures and escheats with respect to conviction and attainder for treason and felony were abolished as from July 4, 1870, except forfeitures consequent upon the now disused process of outlawry, and the forfeitures included in the penalties of *praemunire*.

The term "forfeit" is also applied to penalties imposed by statute for acts or omissions which are neither treasonable nor felonious. In such statutes the forfeiture enures in favour of the Crown unless the statute indicates another destination; and unless a particular method of enforcing the forfeiture is indicated it is enforceable as a debt to the Crown and has priority as such. The words "forfeit and pay" are often used in imposing a pecuniary penalty for a petty misdemeanour, and where they are used the court dealing with the case must not only convict the offender but adjudicate as to the forfeiture.

Statutory forfeitures in some cases extend to specific chattels; e.g., of a British merchant-ship when her character as such is fraudulently dissimulated (Merchant Shipping Act 1894, ss. 70, 76), or of goods smuggled in contravention of the customs acts or books introduced in violation of the copyright acts. Recognizances are said to be forfeited when the conditions are broken and an order of court is made for their enforcement as a Crown debt against the persons bound by them.

The term "forfeiture" is now most commonly used with refer-

ence to real property; i.e., with reference to the rights of lessors to determine the estate or interest of a lessee for breach of the contractual terms of tenure. By legislation of 1881 and 1892 there is jurisdiction to grant relief upon terms against the forfeiture of a lease for breach of certain classes of covenant; e.g., to pay rent or to insure. This previous legislation was reenacted by the Law of Property Act 1925.

FORGERY is defined by Blackstone at common law as "the fraudulent making or alteration of a writing to the prejudice of another man's right," or "the false making, or making *malò animo*, of any written instrument for the purpose of fraud or deceit." This definition, it will be seen, comprehends all fraudulent tampering with documents.

The crime of forgery in English law has been from time to time dealt with in a large number of statutes. It was first made a statutory offence in 1562, and was punishable by fine, by standing in the pillory, having both ears cut off, the nostrils slit up and seared, the forfeiture of land and perpetual imprisonment. It was made capital, without benefit of clergy, in 1634. The most notable cases of those who have suffered the extreme penalty of the law are those of the Rev. Dr. W. Dodd in 1777, for forging Lord Chesterfield's name on a bond, and Henry Fauntleroy, a partner in the banking-house of Marsh, Sibbald & Co., for the appropriation by means of forged instruments of money entrusted to the bank, in 1824.

Up to 1913 there was no statutory definition of forgery, but in that year in the Forgery Act, 1913, a statute passed "to consolidate, simplify and amend the law relating to Forgery and kindred offences," the following definition is given (s. 1). Forgery is the making of a false document in order that it may be used as genuine, and in the case of the seals and dies mentioned in the act the counterfeiting of a seal or die, and forgery with intent to defraud or deceive, as the case may be, is punishable as in the act provided. A document is false within the meaning of the act if the whole or any material part thereof purports to be made by or on behalf or on account of a person who did not make it nor authorize its making; or if, though made by or on behalf or on account of the person by whom or by whose authority it purports to have been made, the time or place of making, where either is material, or, in the case of a document identified by number or mark, the number or any distinguishing mark identifying the document, is falsely stated therein; and in particular a document is false:—(a) if any material alteration, whether by addition, insertion, obliteration, erasure, removal or otherwise, has been made therein; (b) if the whole or some material part of it purports to be made by or on behalf of a fictitious or deceased person; (c) if, though made in the name of an existing person, it is made by him or by his authority with the intention that it should pass as having been made by some person, real or fictitious, other than the person who made or authorized it.

Again for the purposes of the act—(a) it is immaterial in what language a document is expressed or in what place within or without the king's dominions it is expressed to take effect; (b) forgery of a document may be complete even if the document when forged is incomplete, or is not or does not purport to be such a document as would be binding or sufficient in law; (c) the crossing on any cheque, draft on a banker, post-office money order, postal order, coupon or other document, the crossing of which is authorized or recognized by law, shall be a material part of such cheque, draft, order, coupon or document.

Sections 2 to 5 deal with the penalties for forgery of various documents and seals. In most cases forgery is a felony, and, if done with intent to defraud, is punishable with penal servitude for life in the case of wills, deeds and bank notes, and for 14 years in the case of other documents there set out. Forgery with intent to defraud or deceive is subject to a life penalty where a document has thereon the great seal or kindred seals or the royal sign manual, or these seals are forged. Fourteen years is the penalty in the case of registers of births, marriages or deaths, and of the seals of that office. These are only instances and for all the varieties of the offence and their punishments reference must be made to the sections in question.

Forgery of a passport, or the making of a statement which to a person's knowledge is untrue for the purpose of procuring a passport, is made a misdemeanour by the Criminal Justice Act 1925.

Every person who utters any forged document, seal, or die is guilty of an offence of the like degree (whether felony or misdemeanour) and on conviction is liable to the same punishment as if he himself had forged the document, seal or die. A person utters a forged document, seal or die, who, knowing the same to be forged, and with either of the intents necessary to constitute the offence of forging the document, seal or die, uses, offers, publishes, delivers, disposes of, tenders in payment or in exchange, exposes for sale or exchange, exchanges, tenders in evidence, or puts off the forged document, seal or die, and it is immaterial where the document, seal or die was forged.

Demanding property on forged documents, possession of forged documents, seals, or dies without lawful excuse, making or having in possession without lawful excuse paper or implements for forgery are all felonies punishable by penal servitude for varying periods.

Further, any person who knowingly and wilfully aids, abets, counsels, causes, procures, or commands the commission of an offence punishable under the act is liable to be dealt with, indicted, tried, and punished as a principal offender. And where an intent to defraud or an intent to deceive is one of the constituent elements of an offence punishable under any act relating to forgery or any kindred offence for the time being in force, it is not necessary to allege in the indictment or to prove an intent to defraud or deceive any particular person; and it is sufficient to prove that the defendant did the act charged with intent to defraud or to deceive, as the case may require. Also if any person who is a member of any co-partnership, or is one of two or more beneficial owners of any property, forges any document, matter, or thing with intent to defraud the co-partnership or the other beneficial owners, he is liable to be dealt with, indicted, tried, and punished as if he had not been or was not a member of the co-partnership, nor one of such beneficial owners.

The Forged Transfers Act 1891, made retrospective by the Forged Transfers Act 1892, enables companies and local authorities to make compensation by a cash payment out of their funds for any loss arising from a transfer of their stocks, shares or securities through a forged transfer.

UNITED STATES

In the United States, in many of the States the offence of forgery now is defined by statute rather than by common law. Where forgery is so defined by statute, it either enlarges the offence or prescribes a different punishment. In order to constitute forgery, it is essential that there be a false making or alteration of some document, with a fraudulent intent and with the capacity to effect a fraud.

FORGES, COMITÉ DES. The Comité des Forges, a French body, under State control, founded in 1864 to centralize and divide up the supplies of rough casting, and to deal in British steels, was instituted as a "Professional Syndicate" in accordance with the law of 1884.

The Comité des Forges deals on behalf of its adherents with matters referring to their corporative interests: development of the industry on the home market and on the market abroad, commercial agreements, specifications, company matters and labour questions, etc., etc. . . . the study of these latter questions taking place in agreement with the other Syndical Chambers making part of the Union of the Metallurgic and Mining Industries, e.g., the drafts of law on the workmen's superannuation, weekly rest, working of children in works with continuous fire, duration of work, company insurances, etc. . . .

In 1891, seven years before the legislative work, the Comité des Forges created and organized under the form of a mutual insurance pay office, the pecuniary compensation of working accidents. This institution inspired the general principles of the law of 1898. Later the Insurance Pay Office against working accidents was completed by a department for prevention of working accidents.

In 1894, the Comité des Forges created the Superannuation Pay Office of the forges of the metallic construction, the electric industries and industries combined with same, to insure retiring pensions for metallurgical workers. Seven years later the law on workmen's pensions was voted; a legislative regulation allowed joint stock companies having the object of supplying pensions to workmen, to continue their operations; only the Pensions Pay Office of the Forges was able to benefit by this exception.

The Association was in 1928 constructing in the Grenoble district on the east side of the thicket of the Grande Chartreuse, a sanatorium for workmen and clerks. (P. P.E.)

FORGET-ME-NOT, called also scorpion-grass, the name popularly applied to the small annual or perennial herbs forming the genus *Myosotis* of the family Boraginaceae, from the Greek *μῦς*, a mouse, and *οὖς*, an ear, on account of the shape of the leaves. The genus is represented in Europe, north Asia, North America and Australia, and is characterized by oblong or linear stem-leaves, flowers in terminal scorpioid cymes, small blue, pink or white flowers, a five-cleft persistent calyx, a salver- or funnel-shaped corolla, having its mouth closed by five short scales, and hard, smooth, shining nutlets. The common forget-me-not, *M. scorpioides*, native to Europe and Asia, found in Great Britain, and naturalized in North America is perennial; it grows to a height of 6 to 18 in., with rootstock creeping, stem clothed with lax spreading hairs, leaves light green, and somewhat shining, buds pink, becoming blue as they expand, and corolla rotate, and bright blue with a yellow centre. The forget-me-not, a favourite with poets, and the symbol of constancy, is a frequent ornament of brooks, rivers and ditches, and, according to an old German tradition, received its name from the last words of a knight who was drowned in the attempt to procure the flower for his lady. It attains its greatest perfection under cultivation, and, as it flowers throughout the summer, is used with good effect for garden borders. Various European species are widely cultivated, especially *M. scorpioides*, *M. azorica* and *M. sylvatica*. In *M. versicolor* the flowers are yellow when first open and change generally to a dull blue. Of the species in cultivation, *M. dissitiflora*, with large handsome abundant sky-blue flowers, is one of the best and earliest, flowering from February onwards. *M. rupicola*, or *M. alpestris*, 2 to 3 in., intense blue, is a fine rock plant, preferring shady situations and gritty soil.

FORGING is the art of forming or shaping metal by heating and hammering. The art is as old as history. Forging differs from founding or casting in the fact that the metal is never melted, but is worked while hot enough to be in a plastic or pasty condition. The tools used are in the main counterparts of the shapes desired and they mould by impact. Forging is divided into two broad classifications, hand forging and machine forging (see DROP FORGING), according to the way in which the work is done rather than to the work itself; for the operations performed on the metal are of the same general character and the resulting pieces are mainly the same, the difference being that the hand forger, smith or blacksmith works with a hand hammer and variously formed hand tools, whereas machine forging employs to the fullest extent the use of automatic power-driven machines and generally one or more special tools or dies designed and made for the production of the particular piece which it is desired to produce.

Hand forging does employ to some extent power-driven machines to deliver blows instead of relying completely upon muscular effort; the tools used in these machines are of a general nature and can be used on many different forgings rather than being designed for a particular piece. Machine forgings are more uniform and generally of more exact dimensions than those made by hand with hammer and anvil, but the cost of the special tools required for machine forging precludes the use of this method for a small number of forgings, the quantity of equal cost by both methods depending upon the cost of the necessary tools, the cost of production and the possible saving in subsequent operations of machining due to uniformity and exactness. If the requirement be a single round bar bent at right angles on one end, the advantage of hand forging is obvious. If the requirement be several thou-

sand intricate pieces such as an ornamental fence picket, the advantage of machine forging is as readily apparent. One claw hammer head could be produced by the hand forger in very much less time than that necessary to produce the tools required for the machine forging process, but were a large quantity wanted the cost of the machine tools would be very minor when spread over the quantity of pieces produced, and, since after once making the tools, the machine forger's time for producing one piece would be only a small fraction of the hand forger's time, the cost per piece (which is generally though not always the determining factor) would be very much less than if the large quantity were produced by the hand process. There is no definite quantity at which the cost per piece is equal. This quantity is different for each different piece together with the specifications imposed but will in general be from 5 to 100 forgings. The perfecting of machines for making the tools for the machine forging process lowers the point of equal cost. The possibility of future requirements of the same piece should be considered as affecting the cost of the entire quantity eventually required.

Hand forging operations are: (1) reducing or drawing down from a larger to a smaller section (fullering and swaging); (2) enlargement of a smaller to a larger portion (upsetting); (3) bending, or turning to any angle or curvature; (4) uniting one piece of metal to another (welding); (5) the formation of holes by punching; (6) severance, or cutting off. In none of these processes, the last excepted, is the use of a sharp cutting tool involved, and therefore there is no violence done to the fibre of the metal. Nor have the tools of the smith any sharp edges, except the cutting-off tools or "sets." The flow of the metal, which is viscous when at full red heat, must never be lost sight of, and in forging judgment must be exercised in arranging the direction of the fibre in a way best calculated to secure maximum strength.

Fullering is the preliminary roughing-down of the material between tools having convex edges; swaging, the completion or finishing process between swages, on dies of definite shape, nearly hemispherical in form. When a bar has to be reduced from larger to smaller dimensions, it is laid upon a fuller or round-faced stake, set in the anvil, or, in some cases, on a flat face (fig. 1), and blows are dealt upon that portion of the face which lies exactly opposite with a fullering tool and struck on its head by a sledge hammer. The position of the piece of work is quickly changed at brief intervals in order to bring successive portions under the action of the swages until the reduction is completed; the upper face, and if a bottom fuller is used the under face also, is thus left corrugated slightly. These corrugations are then removed either by a flatter (fig. 1), if the surfaces are plane or by hollow swages (fig. 1), if the cross section is circular. Spring swages (fig. 1) are frequently used instead of separate top and bottom tools. Frequently swaging is practised at once, without the preliminary detail of fullering. It is adopted when the amount of reduction is slight, and also when a power hammer is available. This process of drawing down or fullering is, when practicable, adopted in preference to either upsetting or welding, because it is open to no objection, and involves no risk or damage to the

material, while it improves the metal by consolidating its fibres, but its limitations in anvil work lie in the tediousness of the operation when the part to be reduced is very much less in diameter and very much longer than the original piece of bar, in which case there are other alternatives.

FIG. 2.—EXAMPLES OF FORGINGS REQUIRING DRAWING-DOWN, WELDING AND BENDING

Upsetting.—If a long bar is required with an enlargement at any portion of its length, not very much larger in diameter than the bar, nor of great length, upsetting is the method adopted. The part to be enlarged is heated, the parts adjacent remaining cold, and one end is hammered, or else the bar is lifted and dropped heavily on end on the anvil, with the result that the heated portion becomes both shortened and enlarged (fig. 1). This process is suitable only for relatively short lengths of upset in hand forging but is commonly adopted in machine forging to an equal extent with drawing down. The alternative to upsetting is generally to weld a larger to a smaller bar or section, or to encircle the bar with a ring and weld the two (fig. 2), and then to impart any shape desired to the ring in swages.

Bending is effected either by the hammer or by the simple exercise of leverage, the heated bar being pulled round a fulcrum. It is always, when practicable, preferable to cutting out a curved or angular shape with a hot set or to welding. The continuity of the fibre is preserved by bending, and the risk of an imperfect weld is avoided. Hence it is a simple and safe process which is constantly being performed at the anvil. An objection to sharp bends, or those having a small radius, is that the fibres become extended on the outer radius, the cross section being at the same time reduced below that of the bar itself. This is met by imparting a preliminary amount of upsetting to the part to be bent,

FIG. 3.—A FORKED FORGING MADE BY SPLITTING A BAR, OPENING IT OUT AND HAMMERING THE ARMS ROUND AN ANVIL BLOCK

sufficient to counteract the amount of reduction due to extension of the fibres.

Welding is the very valuable property possessed by pieces of iron or steel of uniting autogeneously while in a condition of semifusion. When long portions which differ greatly in dimensions have to be united, welding is the only method practicable at the anvil. It is also generally the best to adopt when union has to be made between pieces at right angles, or when a piece on which much work has to be done is required at the end of a long plain bar, as in the tension rods of cranes and other structures with eyes. The art of welding depends chiefly on having perfectly clean joint faces, free from scale, so that metal can unite to metal, union being prevented by the presence of oxide or dirt.

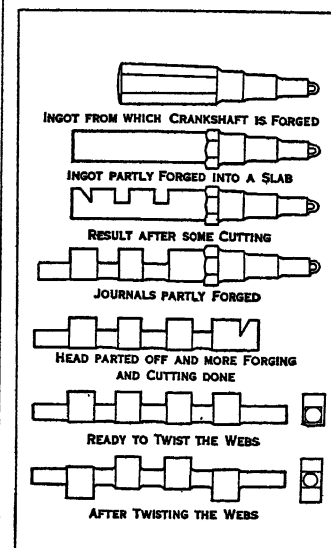

FIG. 4.—SOME OF THE MANY STAGES IN THE FORGING OF A 10-TON CRANKSHAFT BY 1,200-TON HYDRAULIC PRESS

Also it is essential to have a temperature sufficiently high, yet not such as to overheat the metal. A dazzling white, at which small particles of metal begin to drop off, is suitable for iron, but steel must not be made so hot. A very few light hammer blows suffice to effect the actual union. If the joint be faulty, no amount of subsequent hammering will weld it. The forms of weld-joints include the scarf (fig. 2), the

butt (fig. 2), and V (fig. 3) and the glue, one form of which is shown in fig. 3. The illustrations are of bars prepared for welding. These forms give the smith a suitable choice for different conditions. A convexity is imparted to the joint faces in order to favour the expulsion of slag and dirt during the closing of the joint; these undesirable matters would become entangled between concave faces. The ends are upset or enlarged in order to leave enough metal to be dressed down flush, by swaging or by flattening. The proportional lengths of the joint faces shown are those which conform to good practice. The fluxes used for welding are numerous but the most common is borax. Electric welding is largely taking the place of the hand process, particularly in the United States, but machines are required to maintain the parts in contact during the passage of the current. Butt joints without upsetting are usually employed, and a quantity of power is absorbed, but the output is immensely greater than that of hand welding.

Punching.—When holes are not very large they are formed by punching, but large holes are preferably produced by bending a rod around and welding it, so forming an eye (fig. 3). Small holes are often punched simply as a preliminary stage in the formation of a larger hole by the process of drifting, which is the gradual enlarging of the hole by tapered punches. A piece of work to be punched is supported either on the anvil or on a ring of metal termed a bolster, laid on the anvil, through which the burr, when severed, falls. But in making small holes through a thick mass, no burr is produced, the metal yielding sideways and forming an enlargement or boss. Examples occur in the wrought iron stanchions that carry light hand railing. In such cases the hole has to be punched from each face, meeting in the centre. Punching under power hammers is done similarly, but occupies less time.

Cutting-off or severance of material is done either on hot or cold metal. In the first case the chisels used, "hot sets," have keener cutting angles than those employed for the second, termed "cold sets." In one set the anvil chisel is held in a hole in the anvil face, and in the other it is handled and struck with a sledge hammer.

(H. K.)

FORGING PRESS. Forging by machine can be done under steam and pneumatic hammers, drop-hammers, horizontal die-forging machines, and hydraulic presses. The last-named give a squeeze to the metal, instead of a blow, with consequent absence of shock and vibration; the pressure penetrates into the interior of the forging, consolidating the metal and making it of uniform texture. The press will also continue its squeeze and reduce a forging by several inches in thickness at one stroke, which a hammer cannot do. The number of strokes in high-speed presses may be made to equal those of a hammer, up to 120 per minute. This not only enables the smith to complete the forgings at the quickest rate he can manipulate them under the press, but produces better results than usual with the older slow-speed presses, because the metal does not have a chance to cool down to any serious degree.

Although the hydraulic press has long been used for big work in preference to the steam hammer, it is now in competition with it for making forgings of quite moderate size, the power for such being from 100 to 800 tons. All sorts of links, rods, levers, collars, bolts and nuts, spindles, shackles, hooks and such-like are produced thus. Under the larger presses big shafts, bolts, rods, levers, wheels, anchors, tubes, cylinders, guns, shells and armour-plate are forged. Presses for the last-named product have been made to exert a pressure of 14,000 tons. Operations effected under the press apart from actual finish forging are *cogging*, which signifies the reduction of a steel ingot to suitable dimensions for rolling, or for *tilting*, the latter being the further reduction in the press of cogged ingots to the required section and surface finish. *Shingling*, the making of iron from puddled ball, is likewise performed in the press, and straightening, bending and welding before or after the actual forging of pieces. Some presses have three rams—above, below and at the side—to do bending and welding, and move dies in some cases to stamp railway wagon and other repetition articles. Other presses have an extra long stroke for piercing or forging hollow pieces, such as shells. In most forging presses the ram descends from above while the work is supported on a fixed anvil.

The smaller presses have C-shaped frames and the smith is able to move around freely at the open gap to manipulate the forgings with hand tongs, or the help of a light crane.

Large presses are built up with four steel bolts or columns, holding a base in the ground with the anvil or bottom tool so called, the top head taking the pressing cylinder, and the press head being forced by the ram to slide upon the columns. The hydraulic

BY COURTESY OF MESSRS. DAVY BROTHERS, LIMITED

SKETCH SHOWING PARTS OF A 2,000-TON "DAVY" HYDRAULIC PRESS
Pressing is performed by the main cylinder, while the two steam cylinders ensure the rapid return of the ram for another stroke

pressure is delivered to the cylinder from pumps, or accumulator, or from a steam-hydraulic intensifier; this consists of a large steam cylinder with piston exerting pressure upon a small hydraulic plunger, so obtaining a pressure of about $2\frac{1}{2}$ tons per square inch. The presses of Davy Brothers, Ltd., of Sheffield, who build sizes up to the largest, have two lifting cylinders (see the diagram) in which steam pressure gives a very rapid lift for the return stroke, rods from the pistons being connected to the press head. A pre-filler charges the main cylinder with water at a very low pressure, the full hydraulic force coming on when the top tool touches the work. This saves expense in regard to the supply of pressure water. Control gear is so designed that the movements of the press head exactly imitate those of the lever which the attendant works, slowly or rapidly or for instant arrest. A 2,000 ton press of the type illustrated measures over 30ft. in height from the foot of the base to the top of the cylinders. Large presses have two pressing cylinders. If cheap electric or water power is available, the intensifier can be operated with compressed air produced from either of these power sources, instead of by steam.

An overhead crane becomes essential to support the outlying ends of the massive forgings done under the big presses. In order to take advantage of the quick action of the high-speed press, a Davy electric turning gear is suspended from the crane hook, and carries the link chain that encircles the forging. An electric motor and gears revolve a drum on which the link chain laps and so it in consequence revolves the forging. A slipping clutch allows the chain to stand still while forging pressure is on, and drives again when the forging is released giving it a partial turn ready for another squeeze.

As the anvils or tools for the large presses are of great weight, facility of changing to the different sorts must be given rapidly by power methods. This is effected by hydraulic manipulating gear in the floor, a powerful cylinder and ram sliding plates along with the tools mounted thereon. For instance, to change from flat tools to V-tools (for forging crankshafts), the top tool is re-

leased and dropped on to its bottom companion, and the set slid away; the others then come into position and the head picks up its top tool. Hydraulic manipulation is also required to control a heavy bar used to forge tubes and cylinders upon. (F. H.)

FORK, an implement formed of two or more prongs at the end of a shaft or handle, the most familiar type of which is the table-fork for use in eating. In agriculture and horticulture the fork is used for pitching hay, and other green crops, manure, etc.; commonly this has two prongs, "tines"; for digging, breaking up surface soil, preparing for hand weeding and for planting the three-pronged fork is used. The word is also applied to many objects which are characterized by branching ends, as the tuning-fork, with two branching metal prongs, which on being struck vibrates and gives a musical note, used to give a standard of pitch; to the branching into two streams of a river, or the junction where a tributary runs into the main river; and in the human body, to that part where the legs branch off from the trunk.

The *furca*, two pieces of wood fastened together in the form of the letter A, was used by the Romans as an instrument of punishment. It was placed over the shoulders of the criminal, and his hands were fastened to it. Condemned slaves were compelled to carry it about with them, and those sentenced to be flogged would be tied to it; crucifixions were sometimes carried out on a similar shaped instrument.

FORKEL, JOHANN NIKOLAUS (1749–1818), German musician, was born on Feb. 22, 1749 at Meeder, Coburg. The son of a cobbler, he was a good musician; but his fame rests on his historical work, especially as the first biographer of J. S. Bach. His library, which was accumulated with care and discrimination at a time when rare books were cheap, forms a valuable portion of the State library in Berlin and also of the library of the Königl. Institut für Kirchenmusik. He was organist to the university church of Göttingen, obtained the degree of doctor of philosophy, and in 1778 became musical director of the university. He died at Göttingen on March 20, 1818. His most important work is the *Allgemeine Literatur der Musik* (1792). His *Über J. S. Bachs Leben* (1802) was translated into English in 1820 (new trans. by C. S. Terry, 1920).

FORLÌ, a town and episcopal see of Emilia (anc. *Forum Livii*), Italy, capital of the province of Forlì, 40 m. S.E. of Bologna on the railway to Rimini, 108 ft. above sea-level. Pop. (1921) 24,700 (town); 51,994 (commune). The church of S. Mercuriale in the square contains paintings, and good carved and inlaid choir stalls. The fine square, brick campanile (1178–1180) is 252 ft. in height. The municipal picture gallery contains works by Marco Palmezzano (1456–1537) and other interesting pictures, including a fresco representing an apprentice with pestle and mortar (Pestapepe), the only authentic work in Forlì of Melozzo da Forlì (1438–1494), pupil of Piero della Francesca, and master of Palmezzano, of whose works there are several here. The Palazzo del Podestà is a brick building of the 13th century. The citadel (Rocca Ravaldina) was constructed about 1360–1370, and rebuilt later. The felt industry has considerable importance and the surrounding territory is very fertile.

Of the ancient Forum Livii, which lay on the Via Aemilia, hardly anything is known. In the 12th century we find Forlì in league with Ravenna, and in the 13th the imperial count of the province of Romagna resided there. In 1275 Forlì defeated Bologna with great loss. Martin IV. sent an army to besiege it in 1282, which was driven out after severe fighting in the streets; but the town soon afterwards surrendered. In the 14th and 15th centuries it was under the government of the Ordellaffi; and in 1500 was taken by Caesar Borgia, despite a determined resistance by Caterina Sforza, widow of Girolamo Riario. Forlì finally became a part of the papal state in 1504.

FORM (Lat. *forma*), in general, the external shape, appearance, configuration of an object, in contradistinction to the matter of which it is composed; thus a speech may contain excellent arguments—the *matter* may be good, while the style, grammar, arrangement—the *form*—is bad. The term, with its adjective "formal" and the derived nouns "formality" and "formalism," is hence contemptuously used for that which is superficial, unessen-

tial, hypocritical: chap. xxiii. of Matthew's gospel is a classical instance of the distinction between the formalism of the Pharisaic code and genuine religion. With this may be compared the popular phrases "good form" and "bad form" applied to behaviour in society: so "format" (from the French) is technically used of the shape and size, e.g., of a book (octavo, quarto, etc.) or of a cigarette. The word "form" is also applied to certain definite objects: in printing a body of type secured in a chase for printing at one impression ("form" or "forme"); a bench without a back, such as is used in schools (perhaps to be compared with O.Fr. *s'asseoir en forme*, to sit in a row); a mould or shape on or in which an object is manufactured; the lair or nest of a hare. From its use in the sense of regulated order comes the application of the term to a class in a school ("6th form," "5th form," etc.); this sense has been explained without sufficient ground as due to the idea of all children in the same class sitting on a single form (bench).

The word has been used technically in philosophy with various shades of meaning. Thus it is used to translate the Platonic *lōēa*, *ēidos*, the permanent reality which makes a thing what it is, in contrast with the particulars which are finite and subject to change. Whether Plato understood these forms as actually existent apart from all the particular examples, or as being of the nature of immutable physical laws, is matter of discussion. For practical purposes Aristotle was the first to distinguish between matter (*ύλη*) and form (*ēidos*). To Aristotle matter is the undifferentiated primal element: it is rather that from which things develop (*ύποκείμενον*, *δύναμις*) than a thing in itself (*ένεργεια*). The development of particular things from this germinal matter consists in differentiation, the acquiring of particular *forms* of which the knowable universe consists (*cf.* CAUSALITY for the Aristotelian "formal cause"). The perfection of the form of a thing is its entelechy (*έντελέχεια*) in virtue of which it attains its fullest realization of function (*De anima*, ii. 2, *ή μὲν ύλη δύναμις τὸ δὲ εἶδος έντελέχεια*). Thus the entelechy of the body is the soul. The origin of the differentiation process is to be sought in a "prime mover" (*πρῶτον κινόν*), i.e. pure form entirely separate (*χωριστόν*) from all matter, eternal, unchangeable, operating not by its own activity but by the impulse which its own absolute existence excites in matter (*ὡς ἐρώμενον, οὐ κινούμενον*). The Aristotelian conception of form was nominally, though perhaps in most cases unintelligently, adopted by the Scholastics, to whom, however, its origin in the observation of the physical universe was an entirely foreign idea. The most remarkable adaptation is probably that of Aquinas, who distinguished the spiritual world with its "subsistent forms" (*formae separatae*) from the material with its "inherent forms" which exist only in combination with matter. Bacon, returning to the physical standpoint, maintained that all true research must be devoted to the discovery of the real nature or essence of things. His induction searches for the true "form" of light, heat and so forth, analysing the external "form" given in perception into simpler "forms" and their "differences." Thus he would collect all possible instances of hot things, and discover that which is present in all, excluding all those qualities which belong accidentally to one or more of the examples investigated: the "form" of heat is the residuum common to all. Kant transferred the term from the objective to the subjective sphere. All perception is necessarily conditioned by pure "forms of sensibility," i.e., space and time: whatever is perceived is perceived as having spatial and temporal relations (*see* CATEGORY; SPACE-TIME; KANT). These forms are not obtained by abstraction from sensible data, nor are they strictly speaking innate: they are obtained "by the very action of the mind from the co-ordination of its sensations."

FORMALDEHYDE, the first member, H.CHO or CH₂O, of the series of saturated aliphatic aldehydes (*q.v.*) is most readily prepared by passing the vapour of methyl alcohol, mixed with air, over heated copper or platinum; the formaldehyde vapour is condensed and absorbed, either in water or alcohol. At ordinary temperatures formaldehyde is a gas possessing a pungent smell; it is a strong antiseptic and disinfectant, a 40% solution of the aldehyde in water or methyl alcohol, sold as *formalin*,

being employed as a deodorant, fungicide and preservative. It is not possible to obtain the aldehyde in a pure condition, since it readily polymerizes. It is a strong reducing agent; it combines with ammonia to form *hexamethylenetetramine*, $(\text{CH}_2)_6\text{N}_4$, and "condenses" in the presence of some mineral bases to produce compounds which apparently belong to the sugars (*q.v.*). It renders glue, casein or gelatin insoluble in water, and is used in the coal-tar colour industry in the manufacture of pararosaniline, pyronines and rosamines. Several polymerides have been described. *Para-formaldehyde*, obtained by concentrating solutions of formaldehyde *in vacuo*, is a white solid, which on heating changes back into the original form. By cooling gaseous formaldehyde a crystalline polymeride, *trioxymethylene*, is formed $(\text{CH}_2\text{O})_3$; this also reverts to the simple monomeric form on heating. The strength of solutions of formaldehyde may be ascertained by the addition of excess of standard ammonia to the aldehyde solution (hexamethylenetetramine being formed), the excess of ammonia being then estimated by titration with standard acid. Scientific interest attaches to the formation of formaldehyde by the oxidation of methane at high temperatures (W. A. Bone) and by the action of ozone on this hydrocarbon. Formaldehyde also appears to be a reduction product of carbon dioxide and the first stage in the assimilation of this oxide by the green plant during photosynthesis (*see* CARBOHYDRATES), whereupon polymerization of this aldehyde leads to the sugars and other carbohydrates.

FORMALIN, an aqueous solution containing 40% of formaldehyde (*q.v.*), is a commercial product. After dilution this solution is used as a disinfectant, for the preservation of anatomical specimens, etc. It possesses the property of converting protein substances (*q.v.*) into a hard elastic mass insoluble in water. It is also used in photography. A photographic film with a gelatin basis is immersed in a dilute formalin solution for a short time to render the gelatin insoluble.

FORMALISM, in philosophy generally, means undue attention to forms (of thought, or reasoning, etc.), at the expense of content and concrete circumstances. In ethics and religion it refers to the attachment of undue significance to the externals of convention, or to ritual, at the expense of the spirit and substance of morality and religion respectively.

FORMAN, ANDREW (c. 1465–1521), Scottish ecclesiastic, was educated at the university of St. Andrews and entered the service of King James IV., who employed him on various foreign missions. In 1501 he became bishop of Moray, and in July 1513 Louis XII. of France secured his appointment as archbishop of Bourges, while pope Julius II. promised to make him a cardinal. In 1514 Forman was nominated by Pope Leo X. to the vacant archbishopric of St. Andrews, and was made papal legate in Scotland, but his possession of the see was delayed until 1516 on account of the rivalry of Gavin Douglas, the poet, and John Hepburn, prior of St. Andrews. He died on March 11, 1521. As archbishop he issued a series of constitutions which are printed in J. Robertson's *Concilia Scotiae* (1866). A. Lang (*History of Scotland*, vol. i.) describes Forman as "the Wolsey of Scotland, and a fomenter of the war which ended at Flodden."

See J. Herkless and R. K. Hannay, *The Archbishops of St. Andrews* (vol. ii., 1909).

FORMAN, SIMON (1552–1611), English physician and astrologer, was born at Quidham near Wilton. He studied at Magdalen college, Oxford, and in Holland, and then practised as a physician in Philpot lane, London; but as he possessed no diploma, he was imprisoned more than once for quackery and his practice of necromancy. Ultimately, he obtained a diploma from Cambridge and established himself at Lambeth, where he was much consulted, especially by the notorious countess of Essex. He died on Sept. 12, 1611.

Forman's *Grounds on the Longitude* appeared in 1591. His works on astrology are listed in Bliss's edition of the *Athenae Oxonienses*. For his ms. works *see* the article in the *Dict. Nat. Biog.*

FORME or **FORM**. In printing, a page or number of pages of type arranged in a metal form or frame termed a "chase." The name *forme*, used in Great Britain, is a Middle English spelling

of form. The chase secures the type or stereo-plates in position. (*See* PRINTING.)

FORMERET, an architectural term for the rib of a Gothic vault that connects adjacent piers on the same side of the nave or aisle, and forms an arch in the plane of the wall; a wall-rib (*see* VAULT).

FORMIA, a town of Campania, Italy (anc. *Formiae*), province of Rome, on the new direct line between Rome and Naples, 50 m. N.W. of the latter. Pop. (1921) 9,127 (town); 9,391 (commune). It is situated at the north-west extremity of the Bay of Gaeta, and commands beautiful views. It lay on the ancient Via Appia, and was much frequented by wealthy Romans; and it is still a seaside resort in the summer. There was considerable imperial property here and along the coast as far as Sperlonga, and there are numerous remains of ancient villas along the coast and on the slopes above it in some of which important sculptures have been found. The so-called villa of Cicero contains two well-preserved *nymphaea* with Doric architecture, now visible in the villa Caposele, once a summer residence of the kings of Naples. There are many other modern villas, and the sheltered hillsides (for the mountains rise abruptly behind the town) are covered with lemon, orange and pomegranate gardens. The now deserted promontory of the Monte Scauri to the east is also covered with remains of ancient villas; the hill is crowned by a large tomb, known as Torre Giano. To the east at Scauri is a large villa with substructions in "Cyclopean" work. The ancient Formiae was a Volscian town. Cicero possessed a favourite villa here, and was murdered in its vicinity in 43 B.C., but neither the villa nor the tomb can be identified with any certainty.

FORMIC ACID was first prepared by distilling red ants (Lat. *formica*). It occurs in some mineral waters, in animal secretions and in muscle. Its reputed presence in stinging nettles has been controverted. It is the first member of the series of aliphatic monobasic acids (*q.v.*), distinguished from the other members of the series by certain characteristic properties. For example, it shows an aldehydic character in reducing silver salts to metallic silver, it does not form an acid chloride or an acid anhydride, and, by the abstraction of the elements of water from the acid, carbon monoxide is produced, a reaction which finds no parallel in the higher members of the series. Finally, formic acid is, as is shown by the determination of its affinity constant, a much stronger acid than the other acids of the series. Its formula is H_2CO_2 or $\text{H}.\text{COOH}$. It may be prepared artificially by the oxidation of methyl alcohol and of formaldehyde; by the rapid heating of oxalic acid (J. Gay-Lussac, 1831); but best by heating oxalic acid with glycerin at a temperature of 100–110° C (M. Berthelot, 1856). In this reaction a glycerol ester is formed as an intermediate product, and undergoes decomposition by the water which is also produced at the same time.

Formates are produced by the action of moist carbon monoxide on soda lime at 190–220° C (V. Merz and J. Tíbirica, A. Geuther, 1880). An interesting process for sodium formate, due to Bredig and Carter (1915), consists in reducing solution of sodium bi-carbonate with hydrogen at 70° C under 60atmos. pressure in presence of a palladium catalyst. Sodium formate is manufactured by absorbing carbon monoxide by caustic soda at 120–130° C under a pressure of 8 atmospheres.

Concentrated formic acid is prepared by dissolving sodium formate in an equal weight of 90% formic acid, and then distilling the mixture with concentrated sulphuric acid in copper vacuum pans (M. Goldschmidt, 1894). Anhydrous formic acid results when the lead or copper salt is decomposed by dry sulphuretted hydrogen at 130° C. Formic acid is a colourless, sharp-smelling liquid, which crystallizes at 0° C, melts at 8.6° C, and boils at 100.8° C. Its specific gravity is 1.22 (20°/4°). It is miscible in all proportions with water, alcohol and ether. When heated with zinc dust, the acid decomposes into carbon monoxide and hydrogen. The sodium and potassium salts, when heated to 400° C, give oxalates and carbonates of the alkali metals, but the magnesium, calcium and barium salts yield carbonates only. The free acid, when slightly warmed with concentrated sulphuric acid, is decomposed into water and pure carbon monoxide; when heated

with nitric acid, it is oxidized first to oxalic acid and finally to carbon dioxide. The formates are mostly soluble in water, those of silver and lead being the least soluble. The calcium salt, when heated with the calcium salts of higher homologues, gives aldehydes. The esters of the acid may be obtained by distilling a mixture of the sodium or potassium salts and the corresponding alcohol with hydrochloric or sulphuric acids.

Formamide, $\text{H}\cdot\text{CO}\cdot\text{NH}_2$, is obtained by heating ethyl formate with ammonia, by heating ammonium formate with urea to 140°C , or by heating ammonium formate in a sealed tube for some hours at 230°C . It is a liquid which boils *in vacuo* at 150°C , but at $192\text{--}195^\circ\text{C}$ under ordinary atmospheric pressure with partial decomposition into carbon monoxide and ammonia.

FORMICARIIDAE: see PITTA.

FORMIGNY, BATTLE OF (1450). The battle of Formigny, fought on April 15, 1450, was the last but one waged by the English during the Hundred Years' War. Its special interest lies in the use of field artillery, and its influence on bow and lance tactics. The Duke of Somerset was at Caen threatened by an overwhelming French army under King Charles. To open a way to this city, Sir Thomas Kyriel and 4,500 men were despatched from England. At Formigny this force was confronted by the Count of Clermont at the head of some 3,000 lances, a body of local infantry and two small cannons. Kyriel should have at once attacked the French, seeing that his object was to relieve the duke who was hard pressed, but so wedded were the English to defensive tactics that he fell back behind Formigny to a brook lined by orchards, and there drew up his men in a convex line, the archers covering their front by a trench and the usual palisade of stakes. The French, having by now learnt the folly of assaults on unshaken bowmen, skirmished for a while. Then Clermont ordered Giraud, "master of the royal ordnance" to bring up his two guns to enfilade the English line. This proved so effective that the archers left their defences and charged forward capturing the pieces. Kyriel, in place of advancing the whole line and so taking advantage of the *mêlée*, persisted in the defensive, with the result that the archers who had captured the two guns were attacked in flank, and not being able to make use of their bows were thrown back in disorder onto the men at arms. A clinch now took place, and the battle was decided by a fresh body of French knights under the Counts of Richemont and Laval appearing on the field. This force charged the English in flank, surrounded them and annihilated Kyriel and his main battle. The English losses amounted to no less than 3,750, those of the French were probably about 1,200. This battle marks one of the great turning-points in tactics, for before the 15th century ended cannon played an increasingly important part at every siege, and on every field.

See Blondel, *Reductio Normanniae*; C. Oman, *The Art of War in the Middle Ages* (1924).

(J. F. C. F.)

FORMOSA, a northern territory of the Argentine republic, with the Pilcomayo and Bermejo forming its northern and southern boundaries. Estimated area, 41,402 sq.m. It is a vast plain, sloping gently to the south-east, covered with grass-lands, marshes and tropical forests. The interior is still occupied by tribes of Indians. The climate is hot, the summer temperature rising to a maximum of 104°F . Timber-cutting for the *quebracho* industry is the principal occupation of the settlers, though stock-raising and agriculture engage some attention in the settlements near the Paraguay. The capital, Formosa (founded 1879), is a small settlement on the Paraguay with a population of about 10,000 in 1921. The population of the territory was estimated to be 21,880 in 1921. The nomadic Indians are estimated at 8,000.

FORMOSA (Taiwan), an important island in the Western Pacific ocean between the Southern and the Eastern China seas, and separated from the province of Fukien on the Chinese mainland by the Formosa strait, 90 m. in width at its narrowest. The name Formosa was given to the island on account of the majestic beauty of its scenery by the early Spanish navigators, but the Japanese who acquired it after the Sino-Japanese War of 1895 adopted the Chinese term Taiwan as the official name. Formosa forms part of the marginal belt of islands and peninsulas

which constitute the Asiatic section of the Circum-Pacific-fold mountain belt. It is in the form of an elongated oval with a N.N.E.—S.S.W. axis about 225 m. in length. The breadth varies from 60 to 80 m. and the total area is 13,429 square miles. The outstanding feature of its build is the lofty mountain axis which occupies the central and eastern parts of the island. The main water-parting lies near the eastern rim, and on this side there is a rapid descent to great ocean depths. Magnificent sea-cliffs, forming perpendicular walls from 1,500 to 2,500 ft. in height, face the Pacific along many sections. A few small river-plains, notably that of the Giran, occur and there is an important longitudinal valley, parallel to the coast in its middle course, which has been utilized for railway construction. The main mountain peaks of which Niitaka Yama (Mt. Morrison 14,720 ft.) and Setzu-Zan (Mt. Sylvia 12,480 ft.) are the most important, lie somewhat west of the main axis, in the centre of the island. Thence there is a relatively gradual descent to the coastal plain of western Formosa which is the heart of the economic life of the island. The shallow Formosa strait (Taiwan Kaikyo) contrasts with the Pacific deeps, and facilitates the deposition of silt and the growth of alluvial plains. Apart from the western plain, which has a width of about 20 m., the average height of Formosa exceeds 4,000 feet.

Almost exactly bisected by the tropic of Cancer, and lying between two branches of the Kuro Siwo, the island has a distinctly tropical climate. On the plain the mean temperature falls below 15°C only in January. The rainfall is high and well distributed throughout the year, although the south is relatively dry in winter. The combination of heat and moisture, in conjunction with the variety of the topography, gives an exceptionally rich flora. Most of the land under 1,000 ft. (outside the territory of the aborigines) is now used for crops and grass, but luxuriant forests cover the greater part of the mountain zone. A broad belt of palms, banyans, cork trees, camphor trees, tree ferns and dense thickets, up to a height of 3,000 ft., is succeeded by gigantic *Cryptomerias* and *Chamoecyparis* which yield place to pines and short grass on the higher summits.

Population.—The population of Formosa was returned at 3,994,236 in 1924. It is extremely composite in character. The term "natives," totalling 3,679,371, includes the Chinese and two distinct groups of aborigines. The Chinese, much the most numerous element and predominant in the coast plain, are in the main derived from Fukien and Kwangtung provinces, but Hakka and Miaotze peoples from the south China plateau are also represented. The aborigines are divided into: (a) The Pe-pa-hwan (*Anglice*, Pepo-hwans) or "Subdued Savages" comprising over 500 tribes which have vowed allegiance to the Government and have, in varying degrees, adopted Chinese manners and modes of life. Their number is estimated at over 116,000. (b) The Chin-hwan or "Wild Savages," who live in the fastnesses of the Eastern Mountains, and seriously retard the economic development of the Prefectures of Taihoku and Takao by their antipathy to all foreigners. These groups, which like the Pe-pa-hwans are probably of Malay affinities, total about 30,000, comprising 146 tribes, of which by far the most intractable is the head-hunting Taiyal group in the north-east. They constitute a serious problem for the Japanese, and are enclosed by the Aiyu-Sen or guard-line, which extends for over 360 m., of which 230 m. are electrified.

Valuable as the island is to Japan, it is not congenial to Japanese emigrants. The total Japanese population in 1924 was 181,847, the majority of whom, apart from official and military elements, is found in the mining districts of the north-east and sporadically in the plantations along the western coast plain. Other foreigners, generally limited to the trading ports of the north and west, numbered about 30,000 in 1924.

Administration.—The administration of the island in the settled districts closely follows that of Japan, especially since the new regulations of 1920. There is a Civil Governor-General who supervises the administration of the five prefectures of Taihoku, Shinchiku, Taichu, Tainan and Takao, in which task he is aided by a Prefectural Council. The prefectures, municipalities and villages are to a large extent self-governing, their officials being appointed

by the governor of the prefecture to which they belong. Great attention is being devoted to education in accordance with the Japanese policy. By regulations promulgated in 1922, the separate categories of Japanese and native schools have to a large extent disappeared, and both Japanese and natives are now placed under a uniform system of education. There are over 800 elementary and public schools, and several institutions of higher rank, including a medical school and normal schools. There are 27 public schools in the reclaimed aborigines' districts.

The finance of the island is in a satisfactory position, revenue balancing and in some years exceeding expenditure. In 1927-8 both were returned at yen 111,599,202. The revenue is mainly derived from State undertakings, customs and inland taxes.

The economic development of Formosa has changed considerably under Japanese administration. The Chinese regarded the island as a source of raw materials, such as rice, timber and camphor, and as a market for the manufactures of the south China coast. The Japanese, by means of an active subsidized steamship service conducted by the Nippon Yusen Kaisha and the Osaka Shōsen Kaisha also use Formosa as a source of raw materials—indeed it is their tropical storehouse *par excellence*—but further have placed Formosan products on the world markets. To achieve this object large sums have been spent by the Imperial and Formosan Governments on the improvement of communications and harbours. Government monopolies, protective tariffs and the subsidizing of various branches of agriculture and industry are designed for the same end.

Agriculture.—The main agricultural area is the western plain, more especially the section from Taichu to Takow. Mining developments are most important in the north-east, in the rugged area behind Keelung. The main crops are rice, sugar cane, tea, jute, sweet potato, beans and ground nuts. Two rice crops per year are grown and, following upon Government aid in canalization and irrigation, the quality has improved. Japan takes about 16% of the total yield, which mainly comes from the western plain south of Taichu and immediately in front of the low forest of the mountain foothills. The sugar industry is probably the most prosperous and hopeful of all the island developments. This product, grown under the plantation system, is concentrated in the western plain in front of the rice belt from Taichu southwards, whilst a secondary centre occurs around Shinchiku. There were in 1923 about 300,000 acres under this crop. There are now over 40 sugar refineries of modern type, but the total output of brown sugar produced by old-fashioned methods still far exceeds that of refined sugar. The main tea plantations are in the north-west, especially in the area between Shinchiku and Taihoku. The principal type is the highly-flavoured Oolong tea, which is mainly exported to the United States via Japan, instead, as formerly, via Amoy. Commercial fruit growing is another aspect of the agricultural economy of the Formosan plains, the main fruits being bananas, oranges, pineapples and longans.

The forest resources of Taiwan are enormous, and the Government by careful regulation of felling and by reforestation schemes is attempting to keep these resources as static as possible. The main woods are camphor, pines and several hard woods. The chief lumbering developments have been in the Arisan district, lying to the east of Kagi in the foothills of the Formosan highlands. Special importance attaches to the camphor woods of the island. The tree is widely distributed, flourishing up to a height of 3,500 ft., but some of the most valuable areas lie within the territory of the aborigines. The Government originally placed a monopoly on Formosan camphor in 1899 in order to protect the native Japanese industry, but since that time the great increase in the demands of the industrial nations, particularly the United States, for camphor to supply the celluloid and kindred trades has much enhanced the value of the monopoly. At present Japan virtually controls the world output of camphor.

Mining and Communications.—Mining activities are mainly confined to the northern portion of the island. The coal mines behind Keelung are producing good bunker coal and lignites. Gold is found near Shinjo on the east coast, whilst alluvial gold is washed out in the Keelung and Zuiho rivers. Gold is becoming

increasingly important as one of Formosa's most valuable exports. Copper, sulphur and building stone are also extracted in the same region. Petroleum is found sporadically, and now competes with the American and Sumatran product in the Far East. Salt extraction, by evaporation, is a Government monopoly of considerable value, and facilitates contact with the aborigines.

The topography of the island, which implies short, swift-flowing rivers of little use as commercial routes, in conjunction with the problem of the aborigines in the eastern mountains, has concentrated population, roads and railways along the western plain and in the north-east. There are now 6,500 m. of good roads and a railway mileage of 522. Of this the greater part forms the main commercial artery of the western plain between Keelung and Takow, and the remainder part of an uncompleted line in the longitudinal valley parallel to the east coast. These Government railways are fed by narrow gauge mineral and trolley lines which serve the needs of many lumbering districts and sugar plantations, particularly in the Takow and Kagi regions.

Towns and Ports.—The important towns are mainly in the developed western and north-eastern areas, the largest being Taihoku (pop. 186,760) at the junction of the Tamsui and Keelung rivers. The main port of the island, which taps the rich mining and agricultural areas of Taihoku prefecture, is Keelung with a population, in 1923, of 56,258. The western trunk line passes through a number of large towns, the most important, in order of population, being Tainan (83,497), Kagi (42,293), Takow (39,850), Taichu (38,094) and Shinchiku (36,377). Large towns are rare along the eastern coast, the most important being Giran (21,379) and Kaigan.

Good ports are very infrequent, and are limited to the north and west. Keelung is by far the best port and has been improved to accommodate ships of 26 ft. draught at low water. The majority of the coal, mineral and camphor exports leave by this port, and it is still more important as the distributing centre for imports. Tamsui, lying north-east of Taihoku, and on the river of the same name, is the natural port for the agricultural produce of the hinterland, but its trade does not warrant the huge expenditure which would be necessary to make it a good second class port. Tamsui and Keelung are both outports of Taihoku, and the foreign settlement of Taitotei below Taihoku. Takow is a great sugar port and with Tamsui is the main terminal for the extensive junk trade with China.

Trade.—The main competitors in Formosa are Japan and China, but the trade returns now show a remarkable balance in favour of Japan, resulting from the systematic policy of encouraging reciprocal trade. The main exports, in 1923, were, in order of value: sugar, fruits, coal, tea, camphor, rice, gold and fibres. The total exports were valued at 253,672,000 yen, of which 211,098,000 yen went direct to Japan. China, with Hongkong, absorbed 14,696,000 yen of the remainder, while the United States and the Dutch East Indies took goods to the value of 6,596,000 yen and 3,189,000 yen respectively. The imports of Formosa are considerably less in value than the exports, and are more equally distributed amongst the competing nations. Imports in 1923 were, in order of value: beans, vegetables, straw matting, iron, opium, cotton goods, timber and tobacco, the total being valued at 132,839,000 yen. Of these, imports from Japan were valued at 86,573,000 yen, from China and Hongkong at 21,993,000 yen, whilst the United States and the Dutch East Indies sent goods valued at 6,370,000 and 4,023,000 yen respectively. These statistics show clearly the value of Formosa as a constituent part of the Japanese empire. The Chinese population, however, remains an indispensable factor in the development of the island. (P. M. R.)

Ethnology.—Apart from recent Japanese and Chinese settlers the peoples in the island include Chinese Hakkas, related to the tribes of Kwangtung province in China and aborigines. The latter belong physically to the Nesiot type conspicuous in the Philippines and the Dutch Indies, with brown skins and long heads, but they have undoubtedly mixed with other eastern Asiatic elements, including isolated instances of individuals apparently of pygmy stock who have crinkly hair, an indication of a Papuanian negroid element. In culture and in language they have affinities

with the Indonesians, such as the Igorotes of the Philippines. They practise "head-hunting" (*q.v.*) which regulates the social standing of the men and is connected with marriage; they have age grades and matriarchy. The lobes of the ear are mutilated; tattooing is practised and as a puberty ceremony boys and girls have the two upper lateral incisor teeth removed. They practise hoe culture. The unmarried men live apart in bachelor houses, usually built on piles. Property rights are ill defined. Salt is used by some as currency. Ancestor worship is notable, and the priestesses are diviners and act as rain-destroyers. (L. H. D. B.)

BIBLIOGRAPHY.—Janet B. McGovern, *Among the Head Hunters of Formosa*, (1922).

History.—The island of Formosa must have been known to the Chinese at a very early date, but it was not settled extensively by them until late. In the 16th century the Portuguese and Spaniards made some attempts at establishing settlements. In 1624 the Dutch built a fort, Zelandia, on the east coast, and maintained a settlement there for 37 years. On the conquest of China by the Manchus, adherents of the defeated Ming dynasty, under a leader known to Europeans as Koxinga, expelled the Dutch and took possession of a large part of the island. By the close of the 17th century the Chinese portion of the island submitted to the Manchus and Formosa came to be reckoned as part of the empire. Chinese immigrants rapidly came in and conflicts with the aborigines ensued. By the treaties of Tientsin (1858) two ports on Formosa, Taiwan and Tamsui, were opened for foreign trade and Christian missionaries soon followed. In 1874 the island was invaded by the Japanese for the purpose of obtaining satisfaction for the murder of a shipwrecked crew by aborigines, and war with China was narrowly averted. During the Franco-Chinese war of 1884–85 the French partly blockaded the island and held Keelung for some months. In 1895 the island was ceded to Japan by the Treaty of Shimonoseki. The resident Chinese objected and declared a republic, and it was only by force that the Japanese were able to take possession. Some years elapsed, indeed, before they fully pacified the island, and unrest has not been unknown since.

BIBLIOGRAPHY.—Imbault-Huart, *L'Île Formose, histoire et description* (1893); J. D. Clark, *Formosa* (1896); Rutter, *Through Formosa* (1923); *The Japan Year Book*, 1927. (K. S. L.)

FORMOSUS, pope from 891 to 896, first appears in history when, as bishop of Porto, he was sent on an embassy to the Bulgarians. Having afterwards sided with a faction against John VIII., he was excommunicated, but Marinus, the successor of John VIII., restored him to his dignities; and in 891 he was chosen pope. At that time the Holy See was engaged in a struggle against the oppression of the princes of Spoleto, and Formosus was forced to consecrate as emperor Lambert, the young son of Guy of Spoleto. In 895 Arnulf, king of Germany succeeded in seizing Rome, and Formosus crowned him emperor. But, as he was advancing on Spoleto against Lambert, Arnulf was seized with paralysis, and forced to return to Germany. Overwhelmed with chagrin, Formosus died on April 4, 896. The validity of his acts was contested on the pretext that, having been originally bishop of Porto, he could not be a legitimate pope. His body was disinterred in 897 by Stephen VI., and treated as that of a usurper of the papal throne; but Theodore II. restored it to Christian burial, and at a council presided over by John IX. the pontificate of Formosus was declared valid.

FORMS: see DIFFERENTIAL FORMS.

FORMS OF ADDRESS. Every country has its own conventions in regard to modes of address; in few countries are these conventions so numerous as in England. The Anglo-Saxon has evolved a very strict code of style and title, which has grown through the centuries according to a tradition often illogical, but never to be broken with social impunity.

GREAT BRITAIN

To begin with the peerage in Great Britain: dukes and duchesses are always dukes and duchesses when addressed either in speech or in writing; but it is a grave solecism to use the full formal title in addressing any member of the four lesser orders of peers either in conversation or in the intimacy of a private letter. On

envelopes, on invitations, and in, as well as on, legal documents or tradesmen's communications and bills, they are marquises and marchionesses, earls and countesses, viscounts and viscountesses; but in conversation, or in letters beginning "Dear . . ." they must be addressed as "Lord So-and-So" or "Lady So-and-So." In the case of the lowest order, *i.e.*, the peer who is merely a baron, the use of the title is even more restricted; it is used on or in legal documents only. On envelopes in non-legal intercourse, however formal, on invitations or in letters even written in the third person, he is never styled anything but "Lord." Oddly enough, though, this does not apply to the lady who is a baroness in her own right, but these are very few in number: except in speech, and in letters beginning "Dear . . .," she is always called "Baroness," *e.g.*, Baroness Ravensdale, Baroness Burton, Baroness Petre, etc.

In invitations, the full title, except in the case of Barons, is always used. In letters written in the third person, the full title is used in the first place, but afterwards reference is made by means of the colloquial designation. For example: "The editor presents his compliments to the Marquis of Piccadilly and will be much pleased if Lord Piccadilly . . ." etc., etc.

The prefixes "his (or her) grace," "the most noble," "the Rt. Hon." before the names of peers are never used except by tradespeople, lawyers, Court officials and servants.

The sons and daughters of peers have titles of their own, which can only be merged in other peerages. In the case of the three higher orders the eldest son bears a courtesy title, *i.e.*, he is known by one of his father's peerages, but that of course does not provide him with a seat in the House of Lords; the younger sons of dukes and marquises have the prefix "Lord" placed before their christian names and surnames; the younger sons of earls and all the sons of viscounts and barons have that of Honourable, generally shortened to Honble. or Hon. Thus a younger son of a duke of Richmond is Lord Esmé Gordon Lennox; Lord James Douglas was the younger son of a marquis of Queensberry; but the younger son of the earl of Erroll is The Honble. Gilbert Hay, the sons of Viscount Clifden are The Honble. Arthur Agar-Robartes and The Honble. Cecil Agar-Robartes, and the son of Lord Ebbisham is The Honble. Rowland Blades. Some of the older Scots families use their own traditional courtesy titles.

The daughters of dukes, marquises and earls likewise bear the title of Lady prefixed to the Christian name and surname. Thus Lady Mary will remain Lady Mary all her life, unless she marries a peer or a younger son whose father has a higher rank than her own father. If she marries a commoner, a knight or baronet, or an Honble., she still remains Lady Mary, and should always be addressed as such whether in conversation or in writing. The average Englishman seems to find it extremely difficult to remember that to talk to or of Lady Mary Debrett as "Lady Debrett" is to commit one of the deadly sins in social etiquette.

The prefix "Honble.," which applies to the daughters of viscounts and barons, follows the same rule as that which applies to the sons, so long as the daughters are unmarried, *i.e.*, the girl is The Honble. Mary Deburke, just as her brother is The Honble. Thomas Deburke, but when she marries, the christian name is dropped and she becomes The Honble. Mrs. Blank, unless she marries a peer or a man with a courtesy title in the peerage higher than her own. If, for example, she marries Lord Edward Jones (who must be a son of a marquis or a duke) she becomes Lady Edward Jones—she can never become Lady Mary Jones unless her father should become a marquess or a duke. But there is one great difference between these courtesy titles of Lord and Honble.—the latter title is absolutely ignored in conversation, and is never printed on visiting cards.

Baronets and knights bestow the prefix of "Lady" on their wives, but there is nothing in the wife's title to show to which order her husband belongs. The baronet's name is differentiated in writing because the abbreviation "Bart." follows it on envelopes; the ten different orders of knighthood have their initial letters placed after the names of their knights (K.G. Knight of the Garter, and so on down to the last), but their "ladies" have no right to use these letters. Now that the number of knights

and baronets has so enormously increased, there are many ladies in their ranks who bear the same surname, and of late years a habit has grown up in the press of specifying which Lady Debrett or Lady Deburke is meant by mentioning the husband's christian name between brackets, thus "Lady (James) Debrett." This is absolutely wrong both in heraldry and in tradition, but it will probably come to be accepted in the long run on account of the difficulty of indicating, in any other way, to which "Lady" reference is made.

The order of mere knighthood, belonging to none of the ten specified ones, also exists, and the recipient of it has no right to place after his name any letters denoting an order. But of course there are many letters to which he may lay claim if he possesses the necessary qualifications, such as M.D., or R.N., or M.P.; the last being always added to the name of any member of the House of Commons, no matter what his titles may be.

The title of Right Honourable (Rt. Hon.; Rt. Honble.), which belongs of right to all peers—though in their case it is never used, as has been stated before, except on bills or legal or official documents—is the prerogative of members of H.M.'s privy council, and as such, is borne by those of them who are not peers, and by cabinet ministers. It is used in the same way as "Honble." *i.e.*, directly in front of the christian name, *e.g.*, "Rt. Hon. Stanley Baldwin," "Rt. Hon. Sir William Joynson-Hicks." What may be termed professional designations, such as "Dr." or "Rev.," or naval or military, *precede* the prefix of "Honourable," whereas titles of baronetcy and knighthood *follow* the prefix, *e.g.*, The Right Rev. The Honble. Benjamin Plunket, Captain The Honble. Otway Cuffe, General The Honble. Sir Cecil Bingham, Captain The Honble. Sir Seymour Fortescue, K.C.V.O., C.M.G., R.N.

Soldiers and sailors are addressed on all occasions by their professional titles—admiral, general, captain, colonel, commander and so on, except lieutenants in the army, who in private life remain "Thomas Debrett, Esq." Captains in the royal navy add R.N. after their names to show that they belong to the senior service.

There are various equally correct formulas for addressing Judges and Doctors, and the one chosen is a mere matter of preference of the judge or doctor in question. This can generally be discovered by noticing how they style themselves on their visiting cards; *e.g.*, "Sir Horace Avory" or "Mr. Justice Avory"; "C. Drennan, Esqre., M.D." or "Dr. Drennan," or "Sir Sydney Russell-Wells, M.D."

Clergymen are spoken to and of as "Mr.," and on invitations and envelopes are addressed as "The Revd. (or Rev.) George Debrett" and not as "The Revd. Debrett." In conversation a Canon is addressed as "Canon X.," but on envelopes it must be as "The Revd. Canon X." Archdeacons when written to are The Venerable, deans are The Very Reverend, but in both cases are addressed orally as "Mr. Dean." Bishops and archbishops on envelopes are respectively "The Rt. Revd." and "The Most Revd." (in the Church of Rome "Most Revd." and "His Grace," while a cardinal is "His eminence"); in formal speech and in formal writing the form of address is "My lord."

Ambassadors, ministers (in diplomacy) and governors-general have the words "his excellency"—often abbreviated to H.E.—prefixed to their official titles, and, of course, like the titles of soldiers and sailors, judges and doctors and clergymen these words apply, if we would be strictly legal, only to the actual individual bearing them. But it has become a matter of courtesy to give the wives of ambassadors, ministers accredited to foreign Courts, and governors-general the same titles and precedence accorded to their husbands. But neither the precedence nor the title applies outside the limits of the country in which the official holds office.

After the World War, a new order was instituted by the king, and this time it contained a special section and title for women—that of "Dame." It is used in the same way as "The Rt. Honble.," that is to say, it is followed immediately by the christian name, *e.g.*, Dame Edith Lyttelton (or The Honble. Mrs. Alfred Lyttelton), Dame Margaret Lloyd George, Dame Meriel Talbot, and the title is not used by peeresses.

Men who have no titles are termed "esquire" (commonly

shortened to "Esqre." or "Esq.") on their envelopes, and this mode of address, which in pre-Edwardian days used to be severely restricted to a comparatively small class, is now almost universal. Any qualifying letters such as M.P. (Member of Parliament), C.B. (Companion of the Bath), follow after the Esqre., but where there is a title of any kind, the Esqre. must *never* appear. A doctor may be "C. Medico, Esqre., M.D.," but never "Dr. C. Medico, Esqre." In the city of London, and in big provincial towns, where the cultivation of civic pride is recognized as a duty, aldermen and mayors bear their titles in daily life, in speech and writing; in such cases, they should always be addressed on their envelopes according to their style: Mr. Sheriff Jones; Mr. Alderman Brown; the Worshipful the Mayor of—. In speaking it is usual to say "Mr. Mayor"—except, of course, in the case of Lords Mayor, such as London, where "my Lord" takes the place of "Mr." And again in no case should "Esqre." end an address beginning "Alderman" or "Councillor." There is no definite rule for the use of these civic titles, but when a letter is written to the holder of a municipal office at his official address, the envelope must be addressed to him showing his official capacity. In the case of a letter sent to him, as a private citizen, at his home address, the civic title may be dropped.

Ministers and certain other holders of official positions in some of the dominions and Crown colonies enjoy the prefix of Honble. during their term of office, and often on their retirement it is bestowed on them for life. Care should therefore be taken not to omit the prefix where it has been earned.

A source of perplexity to many people is the use of the word dowager. It is distasteful to some women, who look upon the term as practically a label of old age. The associations of the word tend to hide the real meaning, *i.e.*, a woman who receives a dowry. In mediaeval times, such recipients were almost always the widows of men belonging to the landed gentry, who lived in the "dower house" and remained under the protection of the head of the family. In these days, as in ours, the widow was so designated to differentiate her from the wife of the head. But there is no definite legal ruling in the matter; here again it is entirely a question of personal choice. A widow, like everyone else, is entitled to call herself what she likes, so long as by so doing she neither deceives nor defrauds anyone. She is in honour bound to show through her name that she no longer holds the position as wife of the leading member of her husband's family. For practical reasons, also, this is advisable, for so long as she adheres to her old title, her successor in the position has the right to open any letters or parcels so addressed. Many feuds have arisen in families over this matter.

If the term dowager is disliked, the widow can use her christian name instead. In that case the christian name *must* precede the title—the term dowager can either precede the title or be interpolated between the title and the surname, at the choice of the bearer—it can *never* follow it; *e.g.*, the countess dowager of Desart, or Nancy Lady Teignmouth, or the Dowager Viscountess Gormanston. Even in the case of a duchess this rule applies, and certain people who in bygone days would talk of the late "Duchess Adeline of Bedford," instead of "Adeline Duchess of Bedford," were guilty of a serious breach of etiquette.

As regards royalty, the king and princes of the royal blood are addressed in speech as "sir" and the queen and ladies of the royal house as "ma'am." Those wishing to address royalty in writing should approach them through the lady or gentleman in waiting. But the regulations in connection with addressing royalty are so numerous, that to deal with these in detail would lead one far beyond the scope of this article. For further information reference should be made to the books mentioned in the bibliography.

(E. C. OF D.; C. Hos.)

THE UNITED STATES

Although titles, as far as society is concerned, are not customary in the United States, persons holding official positions are designated accordingly. No simpler way could very well be found than this of labelling a man according to his working place in the community, but side by side with the simplicity, certain traditions have grown up regarding the labels.

The president of the United States would be addressed in speech as "Mr. President," and only as "Sir" in the course of a long and personal conversation. Any social correspondence to the president and his wife addressed to them in Washington should read:—

The President
and Mrs. Hoover,
The White House

If from anywhere outside the capital, "Washington, D.C." should be added. Should the president be in any other country (which happens so rarely as to be most improbable), he and his wife would be addressed:—

His Excellency,
The President of the United States,
and Mrs. Herbert Hoover

Although the president, like every other ruler, may dine with friends, according to social form he would never receive an engraved invitation to dinner from any individual. In Washington it is officially understood that he never dines out except with his cabinet officers. When his presence is desired, the personage inviting him would either call at the White House and ask him to select a date, or else write to him to that effect. If the president were to accept such an invitation, his placard would read "The President." His wife's card would read "Mrs. Hoover."

The same form of address should be used for the vice president, in writing:—

The Vice President
in speaking, "Mr. Vice President."

An ambassador is addressed in speech as "Your Excellency;" his wife, as "Mrs. Black." When the American ambassador to Great Britain is invited to dinner in England, his invitation should be addressed:—

His Excellency,
The Ambassador of the United States,
and Mrs. Black

If he were invited to dinner in his own country, his invitation should be addressed:—

The American Ambassador to Great Britain
and Mrs. Black

The most formal invitation would read:—

Mr. and Mrs. John Brown
request the honour of
the company of

The American Ambassador to Great Britain and Mrs. Black
His placard would read "The American Ambassador to Great Britain"; his wife's, "Mrs. Black."

The governors of the States of Massachusetts and Virginia should also be addressed "Your Excellency" since American tradition, coming from England, gives them the titles prescribed by English law. The less formal "Governor" is used for the chief executives of States founded under the republic. An invitation would be addressed to:—

The Governor of the State of New York
and Mrs. Roosevelt

A formal invitation would be worded:—

Mr. and Mrs. John Brown
request the honour of
the company of

The Governor of New York and Mrs. Roosevelt
His place card would read "The Governor of New York"; hers, "Mrs. Roosevelt."

The Mayor of New York would be addressed as "Your Honour" in speech.

His Honour the Mayor of New York
and Mrs. Walker

would be the form of address in writing. To him an invitation would be worded like that to the governor, substituting "The

Mayor of New York." His placard would read "The Mayor of New York"; and his wife's "Mrs. Walker."

In the forms of invitation given, the word "honour" instead of "pleasure" has been suggested. Either may be used, but there is a subtle distinction. "Honour" is usual for an exalted personage—such as an ambassador—especially when a mere Mrs. John Brown is sending the invitation. Between equals, however, "pleasure" is, perhaps, preferable.

Invitations have been chosen first to illustrate modes of written address, because most of the questions asked come from those who desire social information, but we also present some of the formal official rules determining the style to be followed in diplomatic correspondence.

Addresses and Titles.—The title "The Honourable" should be used in writing to: governors, cabinet officers, American ambassadors, American ministers, judges, senators, members of Congress, the secretary to the president, assistant secretaries of executive departments and the heads of independent boards and commissions. The title "Esquire" should be used after the names of: chief clerks and chiefs of bureaux of the executive departments, mayors of cities (when the name is used before the title, as "James Burrows, Esquire, Mayor of . . ."; this applies also to most titles in America, American diplomatic officers below the grade of minister, American consular officers, the clerk of the U.S. Supreme Court and officers of other courts. To this list might be added any gentleman, except when addressed with his wife. The definite article should precede the titles "Honourable" and "Reverend." Professional abbreviations, such as M.D., LL.D., D.D., follow the name of the person addressed, and, according to democratic authorities, no title is prefixed. "George Smith, M.D." is their way of putting it. Socially, however, and according to sophisticated customs, George Smith was born a gentleman (or esquire) before he became a physician or surgeon or a clergyman, and should be "Dr. George Smith" or (possibly) "George Smith, Esq., M.D." or "The Reverend George Smith." In America, as in England, professional titles are rarely used. Mr. Nicholas Murray Butler, for instance, would be addressed as "Mr." or "Esquire" and only officially as "President of Columbia University." It is never correct according to distinguished social usage to make the professional title of paramount importance. Some men, however, cling to it. One judges by their own wishes how to address them.

The monthly *Diplomatic List*, the *State Department Register* and the *Congressional Directory* may be consulted for correct names and addresses of members of the diplomatic corps at Washington and American officials. In the absence of other proper titles of honour or courtesy, correspondence should be addressed "Mr. and Mrs.," "Esquire" for the individual man; "Mrs." and "Miss" for the individual woman.

Beginnings of formal letters should be as follows: to the president—"The President"; to an ambassador—"Your Excellency"; to a minister—"Sir." To the cabinet officers, one uses "Sir" for formal salutations. To a senator, informally, the salutation would be "My dear Senator Smith"; to a member of Congress "My dear Mr. Jones." The use of titles of Judges presents real difficulties. For the U.S. Supreme Court it is "Mr. Chief Justice," and "Mr. Justice." For the court of appeals of New York State, it is "Chief Judge" and "Judge"; for the Supreme Court of the State it is again "Mr. Justice."

Order of Precedence.—After the president, the vice president, ambassadors or chief justices of the Supreme Court (this has never been properly settled), justices of the Supreme Court, ministers, the speaker, cabinet members, senators, chief of staff of the army, chief of naval operations, representatives, chargé d'affaires, major generals and rear admirals, counselors, military and naval attachés, the solicitor general, foreign first secretaries, under secretaries, first assistant secretaries, members of the Federal Reserve Board and Interstate Commerce Commission, secretary of the Smithsonian Institute, director of the Pan-American Union, foreign second and third secretaries, American second and third secretaries.

See *Vogue's Book of Etiquette*.

(E. W. CH.)

FORMULA, in general, a stereotyped form of words to be used on stated occasions, for specific purposes, ceremonies, etc. In the sciences, the word usually denotes a symbolical statement of certain facts; for example, a chemical formula exhibits the composition of a substance (see **CHEMISTRY**); a botanical formula gives the differentia of a plant; a dentition formula indicates the arrangement and number of the teeth of an animal.

FORNER, JUAN PABLO (1756-1797), a Spanish satirist and scholar who was author of the violent diatribe *El Asno erudito* (1782), was born at Mérida on Feb. 23, 1756, and died at Madrid on March 17, 1797. Under various pseudonyms, he engaged in a series of polemics with Garcia de la Huerta, Iriarte and other writers. His brutality in attack is almost unexampled, but his posthumous *Exequias de la lengua castellana* testifies to his scholarship and talent.

FORRES, royal burgh, Moray, Scotland. Pop. (1931) 4,169. Forres (Gaelic, *far uis*, "near water") is on the Findhorn, which is crossed by a suspension bridge about a mile to the west, 11 m. W. of Elgin by the L.M.S.R., and 6 m. by road from Findhorn, its port, due north. It is one of the most ancient towns in the north of Scotland. King Donald (892-900), son of Constantine, died in Forres, and in it King Duff (961-967) was murdered. Macbeth is said to have slain Duncan in the first structure that gave its name to Castlehill, which was probably the building demolished in 1297 by the adherents of Wallace. The next castle was a royal residence from 1189 to 1371. It was burned by the Wolf of Badenoch in 1390. The ruins on the hill, however, are those of a later building and are surmounted by a granite obelisk, 65 ft. high, raised to the memory of Surgeon James Thomson, a native of Cromarty, who at the cost of his life tended the Russian wounded on the field of the Alma. The public buildings include the museum, named after Dr. Hugh Falconer (1808-1865), the palaeontologist and botanist. The cross, in Decorated Gothic, stands beside the town hall. Adjoining the town on the south-east is the beautifully-wooded Cluny hill. The not extensive industries comprise the manufacture of chemicals and artificial manures, flour mills, distilleries and woollen manufactures. There is considerable trade in cattle.

Sueno's stone, about 23 ft. high, one of the finest sculptured monoliths in Scotland, stands in a field to the east of the town. It is carved with figures of soldiers, priests, slaughtered men and captives on one side, and on the other with a cross and Runic ornamentation. According to an old tradition it was named after Sueno, son of Harold, king of Denmark, who won a victory on the spot in 1008, but there are other conjectures. Another storied stone is called the Witches' stone, where Macbeth is said to have encountered the weird sisters.

FORREST, EDWIN (1806-1872), American actor, was born at Philadelphia (Pa.), on March 9, 1806. He made his first stage appearance on Nov. 27, 1820, at the Walnut Street theatre, in Home's *Douglas*. In 1826 he had played a great success in New York as Othello. He played at Drury Lane in the *Gladiator* in 1836, but his Macbeth in 1845 was hissed by the English audience, and his affront to Macready in Edinburgh shortly afterwards—when he stood up in a private box and hissed him—was fatal to his popularity in Great Britain. His jealousy of Macready resulted in the Astor Place riot of 1849. In 1837 he had married Catherine, daughter of John Sinclair, an English singer, and his divorce suit in 1852 was a *cause célèbre*. His last appearance was as Richelieu in Boston in 1871. He died Dec. 12, 1872. He amassed a fortune, much of which he left by will to found a home for aged actors. See Lawrence Barrett, *Edwin Forrest* (Boston, 1881); Montrose J. Moses, *The Fabulous Forrest* (1929).

FORREST, JOHN, 1ST BARON (1847-1918), West Australian statesman and explorer, son of William Forrest, of Leschenaulty, Bunbury, West Australia, was born on Aug. 22, 1847, and educated at Perth, West Australia. In 1865 he joined the Government Survey Department at Perth, and in 1869 led an exploring expedition into the interior in search of D. Leichardt, penetrating through bush and salt-marshes as far inland as 123°E. In 1870 he again made an expedition from Perth to Adelaide, along the southern shores. In 1874, with his brother Alexander

Forrest (born 1849), he explored eastwards from Champion bay, following as far as possible the 26th parallel, and striking the telegraph line between Adelaide and Port Darwin; a distance of about 2,000 m. was covered in about five months with horses and without carriers, a particularly fine achievement. (See **AUSTRALIA: Exploration**.) John Forrest also surveyed in 1878 the north-western district between the rivers Ashburton and Lady Grey, and in 1882 the Fitzroy district. In 1876 he was made deputy surveyor-general; for a few months at the end of 1878 he acted as commissioner of Crown lands and surveyor-general, being given the full appointment in 1883 and retaining it till 1890. When the colony obtained in 1890 its constitution of self-government, Sir John Forrest (who was made K.C.M.G. in 1891 and G.C.M.G. in 1901) became its first premier, and he held that position till in 1901 he joined the Commonwealth Government, first as minister for defence, later as minister for home affairs and postmaster-general, resigning the office of federal treasurer in July 1907. Sir John Forrest was again general treasurer in the Deakin administration of 1909-10, under Sir Joseph Cook (1913-14), and again in 1917-18. His determined opposition to the Labour Party prevented his rise to the premiership. He received a peerage in 1918, and died at sea on his way to England, on Sept. 4 of that year. He published *Explorations in Australia* (1876) and *Notes on Western Australia* (1884-1887). (See H. G. Turner, *First Decade of the Australian Commonwealth* [1911].)

FORREST, NATHAN BEDFORD (1821-1877), Confederate cavalry general in the American Civil War, was born near Chapel Hill (Tenn.), on July 13, 1821. He never received any formal education, but he managed to teach himself with very fair success, and is said to have been an able mathematician. He was in turn a horse and cattle trader in Mississippi, and a slave dealer and horse trader in Memphis, until 1859, when he took to cotton planting in north-western Mississippi and acquired considerable wealth. At the outbreak of the Civil War in 1861 he volunteered as a private, raised a cavalry unit of which he was lieutenant-col., and in Feb. 1862 took part in the defence of Fort Donelson. Refusing, like Generals Floyd and Pillow, to capitulate with the rest of the Confederate forces, he made his way out, before the surrender, with all the mounted troops there. He was made a colonel and regimental commander, and fought at Shiloh with distinction. He was promoted brig.-general in July 1862. At the head of a mounted brigade he took a brilliant part in General Bragg's autumn campaign, and in the winter of 1862-63 he was continually active in raiding the hostile lines of communication. One of the most remarkable of his actions was his capture, near Rome (Ga.), after five days of marching and fighting, of an entire cavalry brigade under Col. A. D. Streight (April 1863). He was present at the battle of Chickamauga in September, after which he was transferred to the Mississippi. He was made a major-general in Dec. 1863.

On April 12, 1864, he assaulted and captured Fort Pillow, in Tennessee on the Mississippi; U.S. negro troops formed a large part of the garrison and according to survivors many were massacred after the fort had surrendered. The "Massacre of Fort Pillow" has been the subject of much controversy and there is conflicting testimony regarding it, but it seems probable that Forrest himself had no part in it. On June 10 he decisively defeated a superior Federal force at Brice's Cross Roads (Miss.), and throughout the year, in spite of the efforts of the Federals to crush him, he raided successfully in Mississippi, Tennessee and Alabama. He was once more with the main Confederate army of the West in the last disastrous campaign of Nashville, and fought stubborn rearguard actions to cover the retreat of the broken Confederates. In Feb. 1865 he was made a lieutenant-general, but the struggle was almost at an end and General James H. Wilson rapidly forced back the few Confederates, now under Forrest's command, and stormed Selma (Ala.), on April 2. The surrender of General Forrest and his whole command followed on May 9. After the war he lived in Memphis, and for some years was president of the Selma, Marion and Memphis railroad. He died at Memphis (Tenn.), on Oct. 29, 1877. The military character of General Forrest was admittedly that of a great leader.

See the biographies by J. A. Wyeth (1899) and J. H. Mathes (1902).

FORSKÅL, PETER (1736-1763), Swedish traveller and naturalist, was born at Helsingfors, and studied at Göttingen. On being required to leave Sweden because of his *Pensées sur la liberté civile* (1759), he was recommended by Linnaeus to Frederick V. of Denmark, who appointed him to Carsten Niebuhr's expedition to Arabia and Egypt in 1761. He died of the plague at Jerim, Arabia, on July 11, 1763. In 1775 appeared his *Descriptiones animalium, avium, amphibiorum, piscium, insectorum, vermium, and Flora Aegyptiaco-Arabica*.

FORSSELL, HANS LUDVIG (1843-1901), Swedish historian and political writer, the son of Adolph Forssell, a distinguished mathematician, was born at Gefle, where his father was professor, on Jan. 14, 1843. He studied at Uppsala, and had a distinguished career in the civil service, becoming in 1880 president of the department of inland revenue. He died at San Bernardino, Switzerland, on Aug. 2, 1901. Of his historical writings the most important were: *The Administrative and Economic History of Sweden after Gustavus I.* (1869-75) and *Sweden in 1571* (1872).

FORST (originally FORSTA or FORSTE), a town of Germany, in the Prussian province of Brandenburg, on the Neisse, 44 m. S. of Frankfort-on-Oder. Pop. (1925) 35,865. Founded in the 13th century, Forst became part of electoral Saxony in 1740. It was ceded to Prussia in 1815. The chief industry of Forst is the manufacture of cloth, but spinning and dyeing are carried on.

FORSTER, EDWARD MORGAN (1879-), British novelist, was educated at Tonbridge School and King's college, Cambridge. His first novel, *Where Angels Fear to Tread* (1905) was followed by *The Longest Journey* (1907) and *A Room with a View* (1908). Wider attention was won by *Howards End* (1910), but thereafter, except for some short stories, *The Celestial Omnibus* (1911), he published little till 1924, when *A Passage to India* appeared. This was a fruit of first hand observation of Indian life, and with it Forster entered into a fuller recognition of his powers as a writer. In 1927 appeared *Aspects of the Novel*, his first volume of criticism.

Forster deals with the interaction of two types of character, the intersection of two planes of living. In all his novels he brings into conflict those who live by convention and those who live by instinct; those for whom property and propriety, and those for whom personal relationships, are the most important things in life. The world of convention he describes with keen observation and keen satire, and his descriptions of it abound in unforgettable touches of wisdom and humour; in the world of instinct and emotion he is really at home, and perhaps never so much as when (as in several of his short stories) he is frankly telling a fairytale. (J. Sp.)

FORSTER, FRANÇOIS (1790-1872), French engraver, was born at Locle in Neuchâtel on Aug. 22, 1790. In 1805 he was apprenticed to an engraver in Paris, and at the same time he studied painting and engraving in the École des Beaux-Arts. He obtained in 1814 the first "grand prix de gravure." The king of Prussia, who was then with the Allies in Paris, bestowed on him a gold medal, and a pension of 1,500 francs for two years. He then pursued his studies in Rome, where his attention was devoted chiefly to the works of Raphael. In 1844 he succeeded Tardieu in the Academy. He died at Paris on June 27, 1872. Among his works may be mentioned—"The Three Graces," and "La Vierge de la Légende," after Raphael; "La Vierge au bas-relief," after Leonardo da Vinci; Francis I. and Charles V., after Gros; St. Cecilia, after Paul Delaroche; Albert Dürer and Henry IV., after Probus; Wellington, after Gérard; and Queen Victoria, after Winterhalter.

FÖRSTER, FRIEDRICH CHRISTOPH (1791-1868), German historian and poet, was the second son of Karl Christoph Förster (1751-1811), and a brother of the painter, Ernest Joachim Förster (1800-85). Born at Münchengosserstadt on the Saale on Sept. 24, 1791, he studied theology at Jena, afterwards devoting some time to archaeology and the history of art. At the outbreak of the War of Liberation in 1813, he joined the army, and by his war-songs added to the national enthusiasm. He then became

professor at the school of engineering and artillery in Berlin, but was dismissed from this office in 1817 on account of his democratic leaning. About 1829 he received an appointment at the royal museum in Berlin. He was the founder and secretary of the *Wissenschaftlicher Kunstverein* in Berlin, and died there on Nov. 8, 1868.

Förster's principal works are: *Der Feldmarschall Blücher und seine Umgebungen* (1820); *Friedrich der Grosse, Jugendjahre, Bildung und Geist* (1822); *Friedrich Wilhelm I., König von Preussen* (Potsdam, 1834-35); *Die Höfe und Kabinette Europas im 18. Jahrhundert* (Potsdam, 1836-39); *Leben und Taten Friedrichs des Grossen* (Meissen, 1840-41); *Wallensteins Prozess* (1844); and *Preussens Helden in Krieg und Frieden, neuere und neueste preussische Geschichte*, 7 volumes (Berlin, 1849-60), the three concluding volumes of which contain the history of the war of liberation of 1813-14-15. Förster also wrote an historical drama, *Gustav Adolf* (1832); and a fragmentary autobiography, *Kunst und Leben*, ed. H. Kletke (1873).

FÖRSTER, FRIEDRICH WILHELM (1869-), German psychologist and educationalist, was born in Berlin on June 2, 1869, and educated in Berlin and Freiburg. After some years spent in the study and practice of education, especially among poverty-stricken or criminal classes, he began to teach at Zürich university, and to issue a series of books, which achieved immense popularity and influence, advocating education in the spirit of a positive Catholic Christianity, with reference to practical problems. The chief of these works were *Jugendlehre* (1904), *Lebenskunde* (1904), *Schule und Charakter* (1907), *Sexualethik und Sexualpädagogik* (1918), *Jugendseele, Jugendbewegung, Jugendziel* (1923). In 1912 Förster resigned his post in Zürich, taking up work at Munich university in 1913. He had already published various political works, and during the World War became prominent as a pacifist. His political works include *Weltpolitik und Weltgewissen* (1919) and *Mein Kampf gegen das militäristische und nationalistische Deutschland* (1920). In 1920 he was forced, on account of his views, to resign his Munich post, and returned to Zürich, where he was employed as Bavarian Minister in Switzerland. He continued, however, to issue in rapid succession works which lost little of their popularity.

FORSTER, GEORG (1754-1794), German traveller and author, was born at Nassenhuben, a small village near Danzig, on Nov. 27, 1754. His father, Johann Reinhold Forster, was commissioned in 1765 by the empress Catherine to inspect the German colonies in the province of Saratov; later he went to England, where he taught natural history and the modern languages at the Warrington nonconformist academy. He lost this appointment, and for two years he and his son earned a precarious livelihood by translations in London. The turning point in Georg's career came in the shape of an invitation for him and his father to accompany Captain Cook in his second voyage round the world. Forster's account of Cook's voyage (*A Voyage Round the World*, London, 1777; in German, Berlin, 1778-80), is almost the first example of the modern scientific travel book. From 1778 to 1784 he was professor of natural history at Cassel. There he formed an intimate friendship with the anatomist Sömmerring, and made the acquaintance of Jacobi, who induced in him a temporary leaning towards mysticism. He married Therese Heyne, a clever and cultivated woman. He then spent four years as a professor at Vilna, and in 1788 became librarian to the elector of Mainz. A keen sympathizer with the French revolution he actively promoted the incorporation of the left bank of the Rhine with France and in 1793 went to Paris to carry on the negotiations. Meanwhile, however, the Germans seized Mainz, and Forster—already disheartened by the turn of events in France—was cut off from all return. Domestic sorrows were added to his political troubles and he died suddenly at Paris on Jan. 10, 1794.

Forster's masterpiece is his *Ansichten vom Niederrhein, von Brabant, Flandern, Holland, England und Frankreich* (1791-94), one of the ablest books of travel of the 18th century. His correspondence was published by his wife (2 vols., Leipzig, 1829); his *Briefwechsel mit Sömmerring*, by H. Hettner (Brunswick, 1877). See J. Moleschott, *G. Forster, der Naturforscher des Volks* (1854, 3rd. ed. 1874); K. Kerstner, *Ein europäischer Revolutionär, Georg Forster, 1754-1794* (1921); W. Langewiesche, *Georg Forster* (1923).

FORSTER, JOHN (1812-1876), English biographer and critic, the son of a cattle-dealer, was born at Newcastle-on-Tyne

on April 2, 1812, and was educated at Newcastle Grammar School and London University. He was entered at the Inner Temple, but devoted himself to journalism, acting as literary and dramatic critic to the *Examiner*, and contributing to other papers. At a later period (1847–56) he edited the *Examiner*. His *Treatise on the Popular Progress in English History* (1840) at once secured recognition of his powers, and he was associated with the principal literary personages of the London of his day, with Bulwer, Talfourd, Fonblanque, Landor, Carlyle and Dickens. The great work by which Forster is known is *The Life of Charles Dickens* (1872–74), one of the great biographies of the English language. Forster died on Feb. 2, 1876.

Forster's other works include: *Lives of the Statesmen of the Commonwealth* (1836–39); *Life and Times of Oliver Goldsmith* (1848; rev. ed. 1854); *Arrest of the Five Members by Charles I.* (1860); *Sir John Eliot: a Biography* (1864); *Life of Landor* (1868); and *Life of Swift* (1875, incomplete).

See a notice by Henry Morley prefixed to the official *Handbook* (1877) of the Dyce and Forster bequests; P. H. Fitzgerald, *John Forster by one of his friends* (1903); R. Renton, *John Forster and his Friendships* (1912).

FORSTER, JOHN COOPER (1823–1886), British surgeon, was born on Nov. 13, 1823, in Lambeth, London, where his father and grandfather before him had been local medical practitioners. He entered Guy's hospital in 1841, and was connected with the hospital from 1850 onwards. In 1858 he performed practically the first gastrotomy in England for a case of cancer of the oesophagus. Among his best-known papers were discussions of acupressure, syphilis, hydrophobia, intestinal obstruction, modified obturator hernia, torsion, and colloid cancer of the large intestine; and he published a book on *Surgical Diseases of Children* in 1860, founded on his experience as surgeon to the hospital for children and women in Waterloo road. He became president of the Royal College of Surgeons in 1884 and died in London on March 2, 1886.

FORSTER, WILLIAM EDWARD (1818–1886), British statesman, was born of Quaker parents at Bradpole in Dorsetshire on July 11, 1818, and educated at the Friends' school at Tottenham. Becoming a woollen manufacturer at Bradford, Yorkshire (whence after his marriage he moved to Burley-in-Wharfedale), he became known as a practical philanthropist. In 1846–47 he accompanied his father to Ireland as distributor of the Friends' relief fund for the famine in Connemara, when the state of the country made a deep impression on him. He married in 1850 Jane Martha, eldest daughter of Dr. Arnold of Rugby. Being childless they adopted the four orphans of Mrs. Forster's brother, William Arnold, when he died in 1859. One of these children, H. O. Arnold-Forster (1855–1909), the well-known Liberal-Unionist member of parliament, became a member of Balfour's cabinet; he was secretary to the Admiralty (1900–03); secretary of State for war (1903–05); and was the author of numerous educational books.

In 1859 W. E. Forster stood as Liberal candidate for Leeds, and was beaten. In 1861 he was returned unopposed for Bradford and again in 1865 and 1868. In 1865 he was made under-secretary for the colonies in earl Russell's ministry, and became a prominent advocate of imperial federation. In 1866 his attitude on parliamentary reform attracted a good deal of attention. He demanded universal education as the essential complement of an extension of the suffrage. Forster and Cardwell, as private members in opposition, brought in Education Bills in 1867 and 1868; and in 1868, when the Liberal party returned to office, Forster was appointed vice-president of the council, with the duty of preparing a government measure for national education. The Elementary Education Bill (*see* EDUCATION) was introduced on Feb. 17, 1870. The Dissenters were by no means satisfied with Forster's "conscience clause" as contained in the bill, and they regarded him, the ex-Quaker, as a deserter from their own side; while they resented the "25th clause," permitting school boards to pay the fees of needy children at denominational schools out of the rates, as an insidious attack upon themselves. The controversy assumed threatening proportions, and Dixon, the Liberal

member for Birmingham and chairman of the Education League, moved an amendment, the effect of which was to prohibit all religious education in board schools. The government made its rejection a question of confidence, and it was withdrawn; but the result was the insertion of the Cowper-Temple clause as a compromise. Extremists on both sides abused Forster, but it is to his enduring credit that the bill of 1870, imperfect as it was, established some approach to a system of national education in England.

Forster's next important work was in passing the Ballot Act of 1872. In 1874 he was again returned for Bradford, in spite of Nonconformist attacks, and took his full share of the work of the Opposition Front Bench. In 1875, when Gladstone "retired," he was strongly supported for the leadership of the Liberal party, but declined to be nominated against Lord Hartington. On Gladstone's return to office in 1880 he was made chief secretary for Ireland, with Lord Cowper as lord-lieutenant. He carried the Compensation for Disturbance Bill through the Commons, only to see it thrown out in the Lords, and his task was made more difficult by the consequent agitation. On Jan. 24, 1881, he introduced, with reluctance, a new Coercion Bill in the House of Commons, to deal with the growth of the Land League. The Irish party used every opportunity in and out of parliament for resenting this act, and Forster was kept constantly on the move between Dublin and London, conducting his campaign against crime and anarchy and defending it in the House of Commons. He was nicknamed "Buckshot" by the Nationalist press, on the supposition that he had ordered its use by the police when firing on a crowd. After the arrest of Parnell (Oct. 13) Forster's life was in constant danger, and he had to be escorted by mounted police when he drove in Dublin. On May 2, 1882, Gladstone announced that the government intended to release Parnell and his fellow-prisoners in Kilmainham, and that both Lord Cowper and Forster had in consequence resigned; and the following Saturday Forster's successor, Lord Frederick Cavendish, and Burke were murdered in Phoenix Park. It was characteristic of the man that Forster at once offered to go back to Dublin temporarily as chief secretary, but the offer was declined. He delivered his fiercest attack on Parnell in the debate on the address (1883), charging him, not with directly planning or perpetrating outrages or murder, but with conniving at them. Forster died on April 6, 1886, on the eve of the introduction of the Home Rule Bill, to which he was stoutly opposed. He had found himself in an increasing degree at variance with Gladstonian Liberalism on other questions, for instance, as regards the Sudan and the Transvaal, nor was he inclined to tolerate the claims of the Caucus or the Birmingham programme. When the Redistribution Act divided Bradford into three constituencies, Forster was returned for the central division, but he never took his seat in the new parliament.

See T. Wemyss Reid, *Life of the Right Hon. H. E. Forster*.

FORSYTH, ANDREW RUSSELL (1858–), Scottish mathematician, was born at Glasgow, on June 18, 1858. He studied at Liverpool and Trinity college, Cambridge, and has held the following posts: professor of mathematics, University college, Liverpool (1882–83); lecturer in mathematics, Trinity college, Cambridge (1884–95); Sadlerian professor at Cambridge (1895–1910) and professor of mathematics, Imperial college of science and technology, London (1913–23). Since 1923 Forsyth has held the post of Emeritus professor at the Imperial college, London. His work covers a wide field in pure mathematics and his treatises contain much that is original, show creative ability and at the same time establish his reputation as a teacher. Forsyth is the author of a number of papers on differential equations, on the theory of functions and on the differential invariants of space. His *Treatise on the Theory of Functions* (1893, etc.) deals with the theories of Riemann, Cauchy and Weierstrass and by means of this work and his other writings on the theory of functions, Forsyth has stimulated interest in the works of Klein, Poincaré, Weierstrass and other foreign mathematicians. He has also written exhaustively on the subject of differential equations and most of his work on this subject is contained in *A Treatise on Differential Equations* (1885, etc.) and *Theory of Differential Equations*.

tions (4 vols. 1890-1906). Forsyth edited volumes viii. to xiii. and the supplementary volume of *Cayley's Collected Mathematical Papers* and was the editor of the *Quarterly Journal of Mathematics* from 1884 to 1895. He is a member of many learned societies and was awarded the Royal medal of the Royal Society in 1897.

Some of his works are *Lectures Introductory to the Theory of Functions of two Complex Variables* (1914); *Lectures on Differential Geometry* (1912, etc.); *Calculus of Variations* (1927).

FORTALEZA (usually called *Ceará* by foreigners), a city and port of Brazil and the capital of the State of Ceará, on a crescent-shaped indentation of the coast-line immediately W. of Cape Mucuripe or Mocaripe, $7\frac{1}{2}$ m. from the mouth of the Ceará river, in lat. $3^{\circ} 42' S.$, long. $38^{\circ} 30' W.$ of Greenwich. Pop. of the municipality, including a large rural district, 1920, 78,536. The city stands on an open sandy plain overlooking the sea, and is regularly laid out, with broad, well paved streets and numerous squares. Owing to the aridity of the climate the vegetation is less luxuriant than in most Brazilian cities. The temperature is usually high, but it is modified by the strong sea winds. Fortaleza has suffered much from epidemics of yellow fever, small-pox and beriberi, but the climate is considered to be healthful. A small branch of the Ceará river, called the Pajehú, traverses the city and divides it into two parts, that on its right bank being locally known as Outeiro. Fortaleza is the see of a bishopric, created in 1854, but it has no cathedral, one of its ten churches being used for that purpose. Its public buildings include the government house, legislative chambers, bishop's palace, an episcopal seminary, a lyceum (high school), Misericórdia hospital, and asylums for mendicants and the insane. The port is the principal outlet for the products of the State, but its anchorage is an open roadstead, one of the most dangerous on the northern coast of Brazil, and all ships are compelled to anchor well out from shore and discharge into lighters. The Baturité railway, built by the National Government partly to give employment to starving refugees in times of long-continued droughts, connects the city and its port with fertile regions to the S.W., and extends nearly to the border of Pernambuco. The exports include sugar, coffee, rubber, cotton, rum, rice, beans, fruits, hides and skins.

Fortaleza had its origin in a small village adjoining a fort established at this point in early colonial times. In 1654 it took the name of Villa do Forte da Assumpção, but it was generally spoken of as Fortaleza. In 1810 it became the capital of Ceará and in 1823 it was raised to the dignity of a city under the title of Fortaleza da Nova Bragança.

FORT ANCIENT, prehistoric Indian defensive work on the Miami river in Warren county, Ohio, stands on a headland (260-280 ft.) projecting from a plateau, and is now included in a State park. The total area is estimated at 100 acres, and its solid content at 3,000,000 cu. feet. The wall, chiefly of earth cast up from an inner ditch, follows the zigzag course of the bluff, except where it crosses the level neck in the rear of the fort, and is 18,712 feet, or a little more than $3\frac{1}{2}$ m. in length, while the height is 6 to 10 ft., except at the only level point of approach, the neck referred to above, where it is 18 to 19 feet. At the north the points more easily approached are generally narrow, sloping ridges, crossed at the upper terminus by a wall, outside of which the ridge was cut down several feet to present a steep slope corresponding to the outer slope of the wall; but where similar ridges form approaches from the south and at some other points, the defences are formed by raising the wall considerably above the usual height. The most vulnerable point was at the isthmus separating the two portions of the fort, known as the Old Fort and the New Fort, where a short space was undefended, though the ascent is not difficult. A short distance east of the posterior wall of the New Fort are two small mounds, from each of which extends a low stone wall running nearly parallel about a quarter of a mile, and forming an irregular semicircle about another small mound. Several small mounds and a number of stone graves containing human remains were within the fort.

FORT ATKINSON, a city of Jefferson county, Wisconsin, U.S.A., on the Rock river, 57m. S.W. of Milwaukee. It is served

by the Chicago and North Western railroad. The population was 4,915 in 1920; 1930 it was 5,793. There are six creameries in the immediate vicinity, and the city has a number of factories. Gen. Henry Atkinson built a stockade here during the Black Hawk War. Permanent settlement began in 1838, and the city was incorporated in 1878.

FORT AUGUSTUS, village, Inverness-shire, Scotland. Pop. (1921) 665. It is delightfully situated at the south-western extremity of Loch Ness, about 30 m. S.W. of Inverness, on the rivers Oich and Tarff and the Caledonian Canal. A branch line connects with Spean Bridge on the L.N.E.R. via Invergarry. The fort, then called Kilchumin, was built in 1716 to check the Highlanders, and was enlarged in 1730 by General Wade. It was captured by the Jacobites in 1745, but reoccupied after Culloden, and named after William Augustus, duke of Cumberland. The fort was bought by the 12th Lord Lovat, whose son presented it in 1876 to the English order of Benedictines. The site is now occupied by St. Benedict's Abbey and school for the higher education of the Roman Catholic gentry.

FORT COLLINS, a city of Colorado, U.S.A., 65m. N. of Denver and 6m. E. of the foothills of the Rocky mountains, on the Cache la Poudre river, at an altitude of 4,994ft.; the seat of the State agricultural college, and the county seat of Larimer county. It is on Federal highway 285, and is served by the Colorado and Southern and the Union Pacific railways. The population was 8,755 in 1920 (91% native white), and was 11,489 in 1930 by the Federal census. Fort Collins is a delightful residential town. The campus of the Colorado agricultural college (established 1870; enrolment for 1926-27, 1,848) covers 160ac. half a mile from the business centre. Adjoining the campus on the west is the college farm; $\frac{1}{2}$ m. E. is the experimental farm of 152ac., and 2m. W. is the college pasture of 1,350 acres. The surrounding country is a very highly developed irrigated district, where sheep-feeding and the raising of sugar-beets predominate. North of the city is a large gas and oil field, opened in 1924. Manufacturing industries include a large beet-sugar factory, brick and tile works, and one of the largest cement plants west of the Mississippi (opened in 1927). In 1864 a company of United States soldiers, under Capt. Collins of the 7th Ohio volunteer infantry, was stationed here to quell the Indian uprisings. The camp soon developed into a trading centre, as the region was settled by farmers from Iowa, Illinois and Ohio, and in 1873 the city was incorporated.

FORT DODGE, a city of Iowa, U.S.A., on the picturesque Des Moines river, 85m. N. by W. of Des Moines; the county seat of Webster county. It is on Federal highway 20, and is served by the Chicago Great Western, the Fort Dodge, Des Moines and Southern, the Illinois Central, and the Minneapolis and St. Louis railways. The population in 1930 Federal census was 21,895. It has a large trade in grain, and is an important centre for the manufacture of gypsum and clay products, and various other articles. East of the city is a gypsum bed 50 sq.m. in area. Clay also abounds and coal is mined in the vicinity. The city has a commission form of government. Fort Dodge was settled late in the '40s. In 1850 Fort Clarke was built to protect the settlers against the Indians, and in 1851 the name was changed, to honour Col. Henry Dodge (1782-1867). The fort was abandoned in 1853. In 1854 a town was laid out, and it was chartered as a city in 1869. In 1868 George Hall of Binghamton, N.Y., took a block of gypsum from the beds at Fort Dodge, carved it roughly in the shape of a human figure, and buried it near Cardiff, Onondaga county, New York, where it was "discovered" by men digging a well in 1869. The "Cardiff giant" was exhibited in various parts of the country as a "petrified man" or a statue dating from prehistoric times, and was the subject of much discussion among scientists and scholars, until the hoax was exposed by Prof. Othniel C. Marsh of Yale, and the perpetrator confessed his part in it.

FORTE (It.), loud, a familiar direction in musical scores, usually in the abbreviated form *f*; increasing degrees of loudness being indicated by *ff* (*fortissimo*) and *fff* (*fortissimo possibile*), while *mf* (*mezzoforte*) signifies a more moderate degree of force.

FORT EDWARD, a village of Washington county, New York, U.S.A., on the Hudson river and the Champlain Barge canal, 55m. N. of Albany. It is served by the Delaware and Hudson railway. The population was 3,850 in 1930. The Indians called this "The Great Carrying Place," as it was the starting point of their usual portage between the Hudson and Lake Champlain. A stockade was built in 1709 by Governor Francis Nicholson on his way to Canada, and some years later a settlement was established by John Henry Lydius (1693–1791) and protected by a new fort, which was destroyed by the French and Indians in 1745. A third fort was built in 1755, as a preliminary to the expedition against Crown Point under General William Johnson, who named it Ft. Edward, in honour of the duke of York. During the Revolution it was the headquarters of General Schuyler while he was blocking the march of General Burgoyne from Ft. Ticonderoga, and the region was the scene of many episodes of the war. The village was incorporated in 1852.

FORTESCUE, SIR JOHN (c. 1394–c. 1476), English lawyer, the second son of Sir John Fortescue, of an ancient Devonshire family, was born at Norris, near South Brent, in Somersetshire, and educated at Exeter college, Oxford. In 1430 he was made a king's sergeant-at-law, and in 1442 chief justice of the king's bench. Fortescue held his office during the remainder of the reign of Henry VI., to whom he steadily adhered; he was attainted of treason in the first parliament of Edward IV. When Henry subsequently fled into Scotland, he is supposed to have appointed Fortescue, who appears to have accompanied him in his flight, chancellor of England. In 1463 Fortescue accompanied Queen Margaret and her court in their exile on the Continent, and returned with them to England in 1471. The chancellor wrote for the instruction of the young prince Edward his celebrated work *De laudibus legum Angliae*. (See trans. by F. Grigor, 1917.) In this treatise, in defining the position of a king, he says "he is appointed to protect his subjects in their lives, properties, and laws; for this very end and purpose *he has the delegation of power from the people*, and he has no just claim to any power but this." He was taken prisoner at the battle of Tewkesbury and on the defeat of the Lancastrian party he made his submission to Edward IV., from whom he received a general pardon dated Westminster, Oct. 13, 1471. He died at an advanced age, but the exact date of his death has not been ascertained.

BIBLIOGRAPHY.—Fortescue's masterly vindication of the laws of England, though received with great favour by the learned of the profession to whom it was communicated, did not appear in print until the reign of Henry VIII., when it was published, but without a date. It was subsequently many times reprinted. Another valuable and learned work by Fortescue, written in English, was first published in 1714, under the title of *The Difference between an Absolute and a Limited Monarchy*. See a revised edition of this work, with valuable historical and biographical introduction, by Charles Plummer, under the title *The Governance of England* (1885). Fortescue's minor writings were collected as *The Works of Sir John Fortescue* (1869, for private circulation), by his descendant, Lord Clermont.

FORTESCUE, SIR JOHN (c. 1531–1607), English statesman, was the eldest son of Sir Adrian Fortescue (executed in 1539), and of his second wife, Anne Reade or Rede. Through his father's mother, Alice, daughter of Sir Geoffrey Boleyn, he was connected with Queen Elizabeth. He directed the Princess Elizabeth's classical studies in Mary's reign, and, on his pupil's accession, was appointed keeper of the great wardrobe. He entered parliament in 1572. In 1589 he was appointed chancellor of the exchequer and a member of the privy council. In 1592 he was knighted, and in Nov. 1601, in addition to his two great offices, he received the chancellorship of the duchy of Lancaster. He was a member of the court of the star chamber and an ecclesiastical commissioner,* sat on various important commissions, and as chancellor of the exchequer explained the queen's financial needs and proposed subsidies in parliament. He was deprived by James of the chancellorship of the exchequer, but retained his two other offices. In 1604 Sir John, who stood for Buckinghamshire, was defeated by Sir Francis Goodwin, whose election, however, was declared void by the lord chancellor on the ground of a sentence of outlawry under which he lay, and Fortescue was by a second

election returned in his place. This incident gave rise to a violent controversy, regarding the chancellor's jurisdiction in deciding disputed elections to parliament, which was repudiated by the Commons but maintained by the king. The matter after much debate was ended by a compromise, which, while leaving the principle unsettled, set aside the elections of both candidates and issued a new writ. Fortescue died on Dec. 23, 1607.

FORTH, river and firth of east Scotland. It is formed by two head streams, Duchray water and Avonduh, or Laggan as it is called after it leaves Loch Ard, both rising north-east of Ben Lomond in Stirlingshire, and uniting 1 m. west of Aberfoyle. From this point till it receives the Kelty, the Forth is in Perthshire, then it becomes the dividing line between Perth and Stirling as far as the confluence of the Allan. Thence it belongs to Stirlingshire to a point 1½ m. due west of Cambus, whence it is the boundary between Stirling and Clackmannan. Owing to its tortuous course between Gartmore and Alloa—the famous "links of the Forth,"—the actual length of the river is 66 m., or nearly double the distance in a direct line (30 m.) between the source of the Duchray and Kincardine, where the firth begins. The river drains an area of 645 sq.m. Its general direction is easterly with a trend towards the south. The alluvial plain from Gartmore to the county town is called the Carse of Stirling. The places of interest on the banks are Aberfoyle, Kippen, Stirling, Cambuskenneth, Alloa and Kincardine. The tide reaches 4½ m. above Stirling, where the river is navigable at high water by vessels of 100 tons. There is some shipping trade at Alloa.

The Firth of Forth extends from Kincardine to the North sea, a distance of 48 m. The width varies from ½ m. at Kincardine and 1½ m. at Queensferry to 6½ m. at Leith and 17½ m. at the mouth. The principal ports on the south shore are Grangemouth, Bo'ness, Granton and Leith, and on the north, Burntisland and Kirkcaldy. Since the opening of the Forth bridge (see BRIDGES) in 1890 the ferries at Queensferry and Burntisland have greatly diminished in importance. The larger islands are Inchcolm, Inchkeith, with fortifications and a lighthouse, and the Isle of May, with a lighthouse and a ruined chapel. The anchorage of St. Margaret's Hope, with the naval base of Rosyth, lies off the shore of Fife immediately to the west of the Forth bridge.

FORTIFICATION AND SIEGECRAFT. "Fortification" is the military art of strengthening positions against attack. The word (Lat. *fortis*, strong, and *facere*, to make) implies the creation of defences. Thus the boy who from the top of a mound defies his comrades, or shelters from their snowballs behind a fence, is merely taking advantage of ground; but if he puts up a hurdle on his mound and stands behind that he has fortified his position.

Fortification has two tactical objects—to obtain the fullest advantage from one's own weapons; and to prevent the enemy using his to advantage. It consists of two elements, viz., *protection* and *obstacle*. The protection shields the defender from the enemy's missiles; the obstacle prevents the enemy from coming to close quarters, and delays him under fire.

Protection may be of several kinds, direct or indirect. Direct protection is given by a wall or rampart of earth, strong enough to stop the enemy's missiles. The value of this is reduced in proportion as the defender has to expose himself to return the enemy's fire, or to resist his attempts to destroy the defences. Indirect protection is given by *distance*, as for instance by a high wall placed on a cliff so that the defender on the top of the wall is out of reach of the enemy's missiles if these are of short range, such as arrows. This kind of defence has naturally lost much of the value that it had in earlier times. Another form of indirect protection of great importance is *concealment*.

The *obstacle* may consist of anything which will impede the enemy's advance and prevent him from coming to close quarters. In the earliest forms of fortification the protecting wall was also the obstacle, or it may be a wet or dry ditch, an entanglement, a swamp, a thorn hedge, a spiked palisade, or some temporary expedient, such as chevaux de frise. The two elements must of course be arranged in combination. The besieged must be able to defend the obstacle from their protected position, otherwise it can

be surmounted or destroyed at leisure.

Protection must be arranged mainly with reference to the enemy's methods of attack and the weapons he uses. The obstacle, on the other hand, should be of such a nature as to bring out the best effects of the defender's weapons. It follows from this that a well-armed force operating against a badly-armed, uncivilized enemy may use with advantage very simple old-fashioned methods of protection; or even dispense with it altogether if the obstacle is a good one. When the assailant has modern weapons the importance of concealment and protection is very great. In fact, it may be said that in proportion as missile weapons have grown more effective, the importance of protection and the difficulty of providing it have increased, while the necessity for a monumental physical obstacle has decreased. The art of the engineer who is about to fortify consists in appreciating and harmonizing all the conditions of the problem, such as the weapons in use, nature of the ground, materials available, temper of assailants and defenders, strategical possibilities, expenditure to be incurred, and so forth. The keynote of the solution should be simplicity; but this is the first point usually lost sight of by the makers of "systems," especially by those who during a long period of peace have time to give play to their imaginations.

Fortification is usually divided into two branches, namely *permanent fortification* and *field fortification*. Permanent fortifications are erected at leisure, with all the resources that a state can supply of constructive and mechanical skill, and are built of enduring materials. Field fortifications are extemporized by troops in the field, perhaps assisted by such local labour and tools as may be procurable, and with materials that do not require much preparation, such as earth, brushwood and light timber. In the course of a campaign these may, as in the World War, be developed into *semi-permanent fortification*.

The *objects of fortification* are various. The vast enceintes of Nineveh and Babylon were planned so that in time of war they might give shelter to the whole population of the country except the field army, with their flocks and herds and household stuff. In the middle ages, feudal lords built castles for security against the attacks of their neighbours, and also to watch over towns or bridges or fords from which they drew revenue; whilst rich towns were surrounded with walls merely for the protection of their own inhabitants and their property. The feudal castles lost their importance when the art of cannon-founding was fairly developed; and in the leisurely wars of the 17th and 18th centuries, when roads were few and bad, a swarm of fortified towns, large and small, played a great part in delaying the march of victorious armies. In the present day isolated forts are seldom used, and only for such purposes as to block passes in mountainous districts. Fortified zones are used either to protect points of vital importance, such as capital cities, military depots and dockyards, or at strategic points such as railway junctions. Fortified areas are also used for more general strategic purposes, as will be explained later.

HISTORY

The most elementary type of fortification is the thorn *hedge*, a type which naturally recurs from age to age under primitive conditions. Thus, Alexander found the villages of the Hyrcanians defended by thick hedges, and the same arrangements have been seen in recent times among the least civilized tribes of Africa. The next advance from the hedge is the *bank* of earth, with the exterior made steep by revetments of sods or hurdle-work. This has a double advantage over the hedge, as, besides being a better obstacle against assault, it gives the defenders an advantage of position in a hand-to-hand fight. Such banks formed the defences of the German towns in Caesar's time, and they were constructed with a high degree of skill. Timber being plentiful, the parapets were built of alternate layers of stones, earth and tree trunks. The latter were built in at right angles to the length of the parapet, and were thus very difficult to displace, while the earth prevented their being set on fire. The bank was often strengthened by a palisade of tree trunks or hurdle-work.

After the bank the most important step in advance for a nation

progressing in the arts was the *wall*, of masonry, sun-dried brick or mud. The history of the development of the wall and of the methods of attacking it is the history of fortification for several thousand years. The first necessity for the wall was height, to give security against escalade. The second was thickness, so that the defenders might have a platform on the top which would give them space to circulate freely and to use their weapons. A lofty wall, thick enough at the top for purposes of defence, would be very expensive if built of solid masonry; therefore, the plan was early introduced of building two walls with a filling of earth or rubble between them. The face of the outer wall would be carried up a few feet above the platform, and crenellated to give protection against arrows and other projectiles. The next forward step for the defence was the construction of *towers* at intervals along the wall. These provided flanking fire along the front; they also afforded refuges for the garrison in case of a successful escalade, and from them the platform could be enfiladed. The evolution of the wall with towers was simple. The main requirements were despotic power and unlimited labour. Thus the finest examples of the system known to history are also amongst the earliest. One of these was Nineveh, built more than 2,000 years B.C. The object of its huge perimeter, more than 50m., has been mentioned. The wall was 120ft. high and 30ft. thick; and there were 1,500 towers. After this no practical advance in the art of fortification was made for a very long time, from a constructional point of view. Many centuries, indeed, elapsed before the inventive genius of man evolved engines and methods of attack fit to cope with such colossal obstacles.

The earliest form of attack was, of course, *escalade*, either by ladders or by heaping up a ramp of faggots or other portable materials. When the increasing height of walls made escalade too difficult, other means of attack had to be invented. Probably the first of these were the *ram*, for battering down the walls, and *mining*. The latter might have two objects: (a) to drive an underground gallery below the wall from the besiegers' position into the fortress, or (b) to destroy the wall itself by undermining. The use of missile *engines* for throwing heavy projectiles probably came later. They are mentioned in the preparations made for the defence of Jerusalem against the Philistines in the 8th century B.C. They are not mentioned in connection with the siege of Troy. At the sieges of Tyre and Jerusalem by Nebuchadnezzar in 587 B.C., we first find mention of the ram and of movable towers placed on mounds to overlook the walls.

Classical Times.—The Asiatics, however, had not the qualities of mind necessary for a systematic development of siegecraft, and it was left for the Greeks practically to create this science. Taking it up in the 5th century B.C., they soon, under Philip of Macedon and Alexander, arrived at a very high degree of skill. They invented and systematized methods which were afterwards perfected by the Romans. The early days of the Roman empire is thus a suitable period at which to take a survey of the practice of the ancients.

In fortification the wall with towers was still the leading idea. The towers were preferred circular in plan, as this form offered the best resistance to the ram. The wall was usually reinforced by a ditch, which had three advantages: it increased the height of the obstacle, made the bringing up of the engines of attack more difficult, and supplied material for the filling of the wall. In special cases, as at Jerusalem and Rhodes, the enclosure walls were doubled and trebled. Citadels were also built on a large scale. The typical site preferred by the Romans for a fortified town was on high ground sloping to a river on one side and with steep slopes falling away on the other three sides. At the highest point was a castle serving as a citadel. The town enclosure was designed in accordance with the character of the surrounding country. Where the enemy's approach was easiest, the walls were higher, flanking towers stronger and ditches wider and deeper. Some of the towers were made high for look-out posts. If there was a bridge over the river, it was defended by a bridge-head on the far side; and stockades defended by towers were built out from either bank above and below the bridge, between which chains or booms could be stretched to bar the passage. The natural features of the

ground were skilfully utilized. Thus when a large town was spread over an irregular site broken by hills, the enceinte wall would be carried over the top of the hills; and in the intervening valleys the wall would not only be made stronger, but would be somewhat drawn back to allow of a flanking defence from the hill tops on either side. The walls would consist of two strong masonry faces, 20 ft. apart, the space between filled with earth and stones. Usually when the lie of the ground was favourable, the outside of the wall would be much higher than the inside, the parapet walk perhaps being but a little above the level of the town. Palisades were used to strengthen the ditches, especially before the gates.

There was little scope, however, in masonry for the genius of Roman warfare, which had a better opportunity in the active work of attack and defence. For siegecraft the Roman legions were especially apt. No modern engineer, civil or military, accustomed to rely on machinery, steam and hydraulic apparatus, could hope to emulate the feats of the legionaries. In earthworks they excelled; and in such work as building and moving about colossal wooden towers under war conditions, they accomplished things at which nowadays we can only wonder. The attack was carried on mainly by the use of "engines," under which head were included all mechanical means of attack—towers, missile engines such as catapults and balistae, rams of different kinds, "tortoises" (see below), etc. Mining, too, was freely resorted to, also approach trenches, the use of which had been introduced by the Greeks. The object of mining, as has been said, might be the driving of a gallery under the wall into the interior of the place, or the destruction of the wall. The latter was effected by excavating large chambers under the foundations. These were supported while the excavation was proceeding by timber struts and planking. When the chambers were large enough the timber supports were burnt, and the wall collapsed. The besieged replied to the mining attack by counter-mines. With these they would undermine and destroy the besiegers' galleries, or would break into them and drive out the workers, either by force of arms or by filling the galleries with smoke.

Breaches in the wall were made by rams. These were of two kinds. For dislodging the cemented masonry of the face of the wall, steel-pointed heads were used; when this was done, another head, shaped like a ram's head, was substituted for battering down the filling of the wall. For escalade they used ladders fixed on wheeled platforms; but the most important means of attack against a high wall were the movable towers of wood. These were built so high that from their tops the parapet walk of the wall could be swept with arrows and stones; and drawbridges were let down from them by which a storming party could reach the top of the wall. The height of the towers was from 70 to 150 ft. They were moved on wheels of solid oak or elm, six to 12 ft. in diameter and three to four feet thick. The ground floor contained one or two rams. The upper floors, of which there might be as many as 15, were furnished with missile engines of a smaller kind. The archers occupied the top floor. There also were placed reservoirs of water to extinguish fire. These were filled by force pumps and fitted with hose made of the intestines of cattle. Drawbridges, either hanging or worked on rollers, were placed at the proper height to give access to the top of the wall, or to a breach, as might be required. Apollodorus proposed to place a couple of rams in the upper part of the tower to destroy the crenellations of the wall. The siege towers had of course to be very solidly built of strong timbers to resist the heavy stones thrown by the engines of the defence. They were protected against fire by screens of osiers, plaited rope or raw hides. Sometimes it was necessary, in order to gain greater height, to place them on high terraces of earth. In that case they would be built on the site. At the siege of Marseille, described by Caesar, special methods of attack had to be employed on account of the strength of the engines used by the besieged and their frequent sallies to destroy the siege works. A square fort, with brick walls 30 ft. long and 5 ft. thick, was built in front of one of the towers of the town to resist sorties. This fort was subsequently raised to a height of six storeys, under shelter of a roof which projected beyond the walls, and from the eaves of which hung heavy mats made of ships' cables.

The mats protected the men working at the walls, and as these were built up the roof was gradually raised by the use of endless screws. The roof was made of heavy beams and planks, over which were laid bricks and clay, and the whole was covered with mats and hides to prevent the bricks from being dislodged. This structure was completed without the loss of a man, and could only have been built by the Romans, whose soldiers were all skilled workmen.

Although these towers were provided with bridges by which storming parties could reach the top of the wall, their main object was usually to dominate the defence and keep down the fire from the walls and towers. Under this protection breaching operations could be carried on. The approaches to the wall were usually made under shelter of galleries of timber or hurdle-work, which were placed on wheels and moved into position as required. When the wall was reached, a shelter of stronger construction, known as a "rat," was placed in position against it. Under this a ram was swung or worked on rollers; or the rat might be used as a shelter for miners or for workmen cutting away the face of the wall. The great rat at Marseille, which extended from the tower already described to the base of the tower of the city, was 60 ft. long, and built largely of great beams two feet square, connected by iron pins and bands. It was unusually narrow, the ground sills of the side walls being only four feet apart. This was no doubt in order to keep down the weight of the structure, which, massive as it was, had to be movable. The sloping roof and sides of timber were protected, like those of the tower, with bricks and moist clay, hides and wool mattresses. Huge stones and barrels of blazing pitch were thrown from the wall upon this rat without effect, and under its cover the soldiers loosened and removed the foundations of the tower until it fell down. In order that it might be possible to move these heavy structures, it was usually necessary to fill up the ditch or to level the surface of the ground. For this purpose, an "approach tortoise" was often used. This was a shelter, something between the ordinary gallery and the rat, which was moved end on towards the wall, and had an open front with a hood, under cover of which the earth brought up for filling the ditch was distributed.

The missile engines threw stones from 75 lb. up to 600 lb. weight, heavy darts from six to 12 ft. long, and Greek fire. Archimedes at the siege of Syracuse even made some throwing 1,800 lb. The ranges varied, according to the machine and the weight thrown, up to 600 yd. for direct fire and 1,000 yd. for curved fire. In addition to the above, great mechanical skill was shown in the construction of special varieties of machines. A kind of jib crane of great height on a movable platform was used to hoist a cage containing 15 or 20 men on to the wall. A long spar with a steel claw at the end, swung in the middle from a lofty frame, served to pull down the upper parts of parapets and overhanging galleries. The defenders on their side were not slow in replying with similar devices. Fenders were let down from the wall to soften the blow of the ram, or the ram heads were caught and held by cranes. Grapnels were lowered from cranes to seize the rats and overturn them. Archimedes used the same idea in the defence of Syracuse for lifting and sinking the Roman galleys. Wooden towers were built on the walls to overtop the towers of the besiegers. Many devices for throwing fire were employed. The tradition that Archimedes burnt the Roman fleet, or a portion of it, at Syracuse, by focusing the rays of the sun with reflectors, is supported by an experiment made by Buffon in 1747. With a reflector having a surface of 50 sq. ft., made up of 168 small mirrors each six by eight inches, lead was melted at a distance of 140 ft. and wood was set on fire at 160 feet. The development of masonry in permanent fortification had long since reached its practical limit, and the attack had become stronger than the defence.

The Middle Ages.—Through the dark ages the Eastern empire kept alive the twin sciences of fortification and siegecraft and from it the Crusaders came to learn what had been lost in the West. In practice the Byzantines favoured multiplied enceintes or several concentric lines of defence. In the West, however, many of the Roman fortifications remained standing, and the Visigoths, allies of Rome, utilized their principles in the defences

of Carcassonne, Toulouse, etc., in the 5th century. Viollet-le-Duc's descriptions and illustrations of the defences of Carcassonne will give a very good idea of the methods then in use:—

"The level of the town is much more elevated than the ground outside, and almost as high as the parapet walks. The curtain walls, of great thickness, are composed of two faces of small cubical masonry alternating with courses of brick. The towers were raised above these curtains, and their communication with the latter might be cut off, so as to make of each tower a small and entirely independent fort. . . . The external ground-level was much lower than that of the tower. . . . The battlemented portion at the top was covered with a roof, and open on the side of the town in order to permit the defenders of the tower to see what was going on therein, and also to allow of their hoisting up stones and other projectiles by means of a rope or pulley." (See fig. 1.)

FIG. 1.—INSIDE VIEW OF THE TOWERS AT CARCASSONNE

Meanwhile, in western Europe, siegecraft had almost disappeared. Its perfect development was only possible for an army like that of the Romans. The Huns and Goths knew nothing of it, and the efforts of the Frankish kings to restore the art were hampered by the fact that their warriors despised handicrafts and understood nothing but the use of their weapons. During the dark ages the towns of the Gauls retained their old Roman and Visigoth defences, which no one knew properly how to attack, and which rarely fell except through blockade and famine. It was not until the 11th century that siegecraft was revived in the West, and by this time the seigneurial castle (*q.v.*), had come into existence. Built primarily as strongholds for local magnates or for small bodies of warriors dominating a conquered country, these had special defensive assets, whereas the defences of a town had to follow the growth of the town, and would naturally have weak points. The site of a castle could be chosen purely for its natural strength; and as its area was small it was often easy to find a natural position entirely suited for the purpose. A small hill with steep sides might well be unapproachable by such cumbersome structures as towers and rats, while the height of the hill, added to the height of the walls, would be too much for the besiegers' missiles. If the sides of the hill were precipitous and rocky, mining became impossible, and the site was perfect for defence. A castle built under such conditions was practically impregnable; and this was the cause of the independence of the barons in the 11th and 12th centuries. They could only be reduced by blockade, and a blockade of long duration was very difficult in the feudal age.

A very instructive example of 12th century work is the Château Gaillard, built by Richard Coeur-de-Lion in 1196. In the article CASTLE will be found the plan of the main work, which is here supplemented by an elevation of the donjon (or keep). The waved face of the inner or main wall of the castle, giving a divergent fire over the front, is an interesting feature in advance of the time. After the death of Richard, Philip Augustus besieged the château, and carried it after a blockade of seven months and a regular attack of one month. In this attack the tower at A was first mined, after which the whole of that outwork was abandoned by the defenders. The outer enceinte was next captured by surprise; and finally the gate of the main wall was breached by the pioneers. When this happened a sudden rush of the besiegers prevented the remains of the garrison from gaining the shelter of the donjon, and they had to lay down their arms. Château Gaillard, designed by perhaps the greatest general of his time, exemplifies

FIG. 2.—DONJON AT CHÂTEAU GAILLARD

in its brief resistance the weak points of the designs of the 12th century. At each step gained by the besiegers the very difficulties which had been placed in the way of their further advance prevented the garrison from reinforcing strongly the points attacked.

In the 13th century many influences were at work in the development of castellar fortification. The experience of such sieges as that of Château Gaillard, and still more that gained in the Crusades, the larger garrisons at the disposal of the great feudal lords, and the importance of the interests which they had to protect in their towns, led to a freer style of design. We must also take note of an essential difference between the forms of attack preferred by the Roman soldiery and by the mediaeval chivalry. The former, who were artisans as well as soldiers, preferred in siege works the certain if laborious methods of breaching and mining. The latter, who considered all manual labour beneath them and whose ideal of warfare was personal combat, affected the tower and its bridge, giving access to the top of the wall rather than the rat and battering ram. We find, therefore, important progress in enlarging the area of defence and in improving arrangements for flanking. The size and height of all works were increased. The keep of Coucy castle, built in 1220, was 200ft. high. Montargis castle, also built about this time, had a central donjon and a large open enclosure, within which the whole gar-

FIG. 3.—DIAGRAM OF A TYPICAL CROSS-SECTION OF A FORT

ison could move freely, to reinforce quickly any threatened point. The effect of flanking fire was increased by giving more projection to the towers, whose sides were in some cases made at right angles to the curtain walls. We find also a tendency towards complexity and multiplication of defences, to guard against surprise and localize successful assaults. Great attention was paid to the "step by step" defence. Complicated entrances with traps and many doors were arranged. Almost all defence was from the tops of the walls and towers, Machicouli galleries being employed for vertical defence.

The defences of Carcassonne, remodelled in the latter half of the 13th century, exemplify some of the best work of the period. There are only two gates. That on the east is defended by two great towers and a semicircular barbican. The gate of the castle, on the west, has a most complicated approach, and beyond this is a huge circular barbican in several storeys. On the side of the town the castle is protected by a wide moat, and the entrance is masked by another large semicircular barbican. An interesting feature is the importance which the lists have assumed. The slight wooden barricade of older times has developed into a wall with towers; and the effect is that the besieger, if he gains a footing in the lists, has a very narrow space in which to work the engines of attack. The castle, after the Roman fashion, adjoins the outer wall of the town, so that there may be a possibility of communicating with a relieving force from outside after the town has fallen. There were also several posterns, small openings made in the wall at some height above the ground, for use with rope ladders.

The siegecraft of the period was still that of the ancients. Mining was the most effective form of attack, and the approach to the walls was covered by engines throwing great stones against the hoardings of the parapets, and by cross-bowmen who were sheltered behind light mantlets moved on wheels. Barrels of burning pitch and other incendiary projectiles were thrown as before; and at one siege we read of the carcasses of dead horses and barrels of sewage being thrown into the town to breed pestilence, which had the effect of forcing a capitulation. With all this the attack was inferior to the defence, owing to the inherent limitations of the "engineer," until gunpowder was introduced.

Introduction of Gunpowder.—Artillery was, however, in use for some time before it began to have any effect on the design of fortification. The earliest cannon threw so very light a projectile that they had no effect on masonry. In the middle of the 15th century the art of cannon-founding was much developed by the brothers Bureau in France. They introduced iron cannon balls and greatly strengthened the guns. In 1428 the English besieging Orleans were entirely defeated by the superior artillery of the besieged. By 1450 Charles VII. was furnished with so powerful a siege train that he captured the whole of the castles in Normandy from the English in one year. But the great change came after the invasion of Italy by Charles VIII. with a greatly improved siege train in 1494. The astonishing rapidity with which castles and fortified towns fell before him proved the uselessness of the old defences. It became necessary to create a new system of defences, and the lead came from Italy. There, where the mental Renaissance combined with constant physical conflicts, the greatest intellects, such as Leonardo da Vinci, Michelangelo and Machiavelli, busied themselves over the problem of defence. It has been claimed that Albert Dürer was the first writer on modern fortification. This was not so; Dürer's work was published in 1527, and more than one Italian engineer, certainly Martini of Siena and San Gallo, had preceded him. Also Machiavelli, writing between 1512 and 1527, had offered some most valuable criticisms and general principles. Dürer's projects were too massive and costly for execution, but his name is associated with the first practical gun casemates.

Before beginning to trace the effect of gunpowder on the design of fortification, it may be noted that two causes weakened the influence of the castles. First, their owners were slow to adopt the new ideas and abandon their high strong walls for low extended parapets, and, secondly, they had not the men necessary for long lines of defence. At the same time the corporations of the towns had learnt to take an active part in warfare, and provided trained and disciplined soldiers in large numbers. When artillery became strong enough to destroy masonry from a distance two results followed: it was necessary to modify the masonry defences so as to make them less vulnerable, and to improve the means of employing the guns of the defence. For both these purposes the older castles with their restricted area were little suited, and we must now trace the development of the fortified towns. Probably the first form of construction directly due to the appearance of the new weapons was the bulwark (*boulevard, baluardo* or *bollwerk*). This was an outwork usually semicircular in plan, built of earth consolidated with timber and revetted with hurdles. Such works were placed as a shield in front of the gates, and they offered at the same time advanced positions for the guns of the defence. The first real lesson taught by improved artillery was that the walls should not be set up on high as targets, but in some manner screened; in the case of old works, by placing bulwarks in front of them; in new works by sinking the wall in a ditch.

For resistance to the effect of shot the most valuable expedient was the use of counterforts. The earliest counterforts were simply buttresses built *inward* from the wall into the rampart instead of *outward*. The effect of these was to strengthen the wall and make the breaches more difficult of ascent. An alternative arrangement for strengthening the wall was an arched gallery built behind it under the rampart. More important still was the development of the active defence by artillery. For this purpose it was necessary to find room for the working of the guns. Various modifications of the existing masonry defences were tried, but the natural solution, soon generally adopted, was the rampart; that is, a bank of earth thrown up behind the wall, which while strengthening the wall as already indicated, offered plenty of space for the disposal of the guns.

The *ditch*, which had only been occasionally used in ancient and mediaeval fortification, now became essential and characteristic. Serving as it did the double purpose of supplying earth for

a rampart and allowing the wall to be sunk for concealment, it was found also to have a definite use as an obstacle. Hitherto the wall has sufficed for this purpose, the ditch being useful mainly to prevent the besieger from bringing up his engines of attack.

When the wall (or escarp) was lowered, the obstacle offered by the ditch was increased by revetting the far side of it with a *counterscarp*. Beyond it some of the earth excavated from the ditch was piled up to increase the protection given to the escarp wall, and sloped gently in such manner as to be swept by the fire from the ramparts; this was called the *glacis*. But the introduction of the counterscarp wall prevented sorties from the ditch, as hitherto, against the besiegers. Hence a space, at ground-level, came to be left behind the glacis, allowing room for troops to assemble. This was known as the *covered way*. With this last addition the ordinary elements of a profile of "post-gunpowder" fortification were complete.

Up to the gunpowder period the *trace* of fortifications, that is, the plan on which they were arranged on the ground, was very simple. It was merely a question of an enclosure wall adapted to the site and provided with towers at suitable intervals. The foot of the wall could be seen and defended everywhere, from the tops of the towers and the machicoulis galleries. The introduction of ramparts and artillery made this more difficult. The rampart, interposed between the defenders and the face of the wall, put a stop to vertical defence, while guns from the top of the wall could not be depressed sufficiently for flanking fire along the ditch. The problem of the "trace," therefore, at the beginning of the 16th century was to rearrange the line of defence so as to give due opportunity to the artillery of the besieged. At first for flanking purposes casemates on the ditch level were used, the old flanking towers being enlarged for the purpose. Some use was also made of the fire from detached bulwarks. It was soon realized, however, that the flanking defence of the body of the place ought not to be dependent on outworks, and that greater freedom was required for guns than was consistent with casemate defence. The *bulwark* was too detached for security. The enlarged tower, as an integral part of the lines, gave security, and its walls at right angles to the curtain gave direct flanking fire, but the guns in it were too cramped. The blending of the two ideas produced the *bastion*, an element of fortification which dominated the science for 300 years. The word has been in use for a long time in connection with extemporized towers or platforms for flanking purposes, the earliest forms being *bastille, bastide, bastillon*, and in its origin it apparently refers rather to the quality of work in the construction than to its defensive intention. The earliest bastions were modified bulwarks with straight faces and flanks, attached to the main wall, for which the old towers often acted as keeps; and at first the terms bulwark and bastion were more or less interchangeable.

Towards the end of the 16th century the term "bulwark" began to be reserved for banks of earth thrown up a little distance in front of the main wall to protect it from breaching fire. "Bastion" henceforth denoted an artillery position connected by flanks to the main wall; and the question of the arrangement of these flanks was one of the main preoccupations of engineers. Thus, while in the early part of the 16th century the actual modification of existing defences was proceeding very slowly on account of the expense involved, the era of theoretical "systems" had begun, based on the mutual relations of flank and face. These can be grouped under three heads as follows:—

1. The *crémaillère* or indented trace: Faces and flanks succeeding each other in regular order (fig. 4).
2. The *tenaille* trace: Flanks back to back between the faces (fig. 5). The development of the flanks in this case gives us the *star* trace (fig. 6).
3. The *bastioned* trace: Flanks facing each other and connected by curtains (fig. 7).

In comparing these three traces it will be observed that unless

FIG. 5.—TENAILLE TRACE

FIG. 4.—CRÉMAILLÈRE OR INDENTED TRACE

FIG. 6.—STAR TRACE

casemates are used the flanking in the first two is incomplete. Guns on the ramparts of the faces cannot defend the flanks, and therefore there are "dead" angles in the ditch. In the bastioned trace there is no "dead" ground, provided the flanks are so far apart that a shot from the rampart of a flank can reach the ditch at the centre of the curtain. Here was therefore the parting of the ways. For those who objected to casemate fire, the bastioned trace was the way of salvation. They were soon in the majority; perhaps because the symmetry and completeness of the idea captivated the imagination. At all events the bastioned trace, once fairly developed, held the field in one form or another practically without a rival until near the end of the 18th century. The Italian engineers, who were supreme throughout most of the 16th century, started it; the French, who took the lead in the following century, developed it.

FIG. 7.—BASTIONED TRACE

It will be useful at this point to go forward a little, with a simple explanatory figure, in order to get a grasp of the component parts of the bastioned trace as ultimately developed, and of its outworks. (The line of the escarp is called the *magistral line* since it regulates the trace. When plans of fortifications are given without much detail, this line, with that of the counterscarp and the crest of the parapet, are often the only ones shown—the crest of the parapet, as being the most important line, whence the fire proceeds, being usually emphasized by a thick black line.)

Fig. 8, reproduced from a French engraving of 1705, shows an imaginary place fortified as a hexagon with bastions and all the different kinds of outworks then in use. The following is the explanation of its figuring and lettering:

1. *Flat bastion*: Placed in the middle of a curtain when the lines of defence were too long for musketry range.
2. *Demi-bastion*: Used generally on the bank of a river.
3. *Tenaille bastion*: Used when the flanked angle is too acute: that is, less than 70° .
4. *Redans*: Used along the bank of a river, or when the parapet of the covered way can be taken in reverse from the front.
- A. B. *Ravelins*.
- C. *Demi-lunes*: So called from the shape of the gorge. They differ from the ravelins in being placed in front of the bastions instead of the curtains.
- D. *Counter-guards*: Used instead of demi-lunes, which were then going out of fashion.
- E. *Simple tenaille*.
- F. *Double tenaille* (see L and M).
- (If the tenaille E is reduced in width towards the gorge, as shown alternatively, it is called a *swallow-tail*. If the double tenaille is reduced as at G, it is called a *bonnet de prêtre*. Such works were rarely used.)
- H. *Hornwork*: Much used for gates, etc.
- I. *Crown-work*.
- K. *Crowned hornwork*.
- L. M. New forms of *tenaille*: (N.B.—These are the forms which ultimately retained the name).
- N. New form of work called a *demi-lune lunettée*, the ravelin N being protected by two counter-guards, O.
- P. *Re-entering places of arms*.
- Q. *Traverses*.
- R. *Salient places of arms*.
- S. *Places of arms without traverses*.
- T. *Orillon*, to protect the flank V.
- X. A *double bastion or cavalier*.
- Y. A *retrenchment with a ditch*, of the breach Z.
- &. *Traverses* to protect the terreplein of the ramparts from enfilade.

Turning back now to the middle of the 16th century we find in the early examples of the use of the bastion that there is no attempt made to defend its faces by flanking fire, the curtains being considered the only weak points of the enceinte. Accordingly, the flanks are arranged at right angles to the curtain, and the prolongation of the faces sometimes falls near the middle of it. When it was found that the faces needed protection, the first attempts to give it were made by erecting cavaliers, or raised parapets, behind the parapet of the curtain or in the bastions. The first example of the complete bastioned system is found in Paciotto's citadel of Antwerp, built in 1568. In this case we have faces, flanks and curtain in due proportion; the faces long enough to contain a powerful battery, and the flanks able to defend both curtain and faces. The weak points of this trace, due to its being arranged on a small

pentagon, are that the terreplein or interior space of the bastions is rather cramped, and the salient angles too acute.

In the systems published by Speckle of Strasbourg in 1585 we find a distinct advance—in the absence of outworks, the use of cavaliers and double parapets and in his own particular invention of the low batteries behind the re-entering place of arms and the gorge of the ravelin. But his ideas were rather in advance of the powers of the artillery of his day.

Early in the 17th century Marchi and Busca in Italy, if excessively geometrical, and de Ville and Pagan in France, contributed to the evolution of fortification. It is the latter half of the 17th century, however, which is one of the most important periods in the history of fortification, chiefly because it was illuminated by the work of Vauban. It was at this time also that a prodigious output of purely theoretical fortification began, which went on till the French Revolution. Many of the "systems" published at this time were elaborated by men who had no practical knowledge of the subject, and they tended to a multiplication of outworks which culminated in such extravagances as the system of Rhana, published in 1769.

Vauban.—The work of the masters who knew more than they published can always be recognized by its comparative simplicity. The greatest of these was Sebastien le Prestre de Vauban

FIG. 8.—TYPICAL FORTRESS OF THE 16TH CENTURY ILLUSTRATING VARIOUS FORMS OF WORKS USED

(*q.v.*). Born in 1633, and busied from his 18th year till his death in 1707 in war or preparations for war, his genius, no less than his experience, puts him in a category apart from others. Of this it is enough to say that he took part in 48 sieges, 40 of which he directed as chief engineer without a single failure, and repaired or constructed more than 160 places. Vauban's genius was essentially practical, and he was no believer in systems. He would say, "One does not fortify by systems but by common sense." Of new ideas in fortification he introduced practically none, but he improved and modified existing ideas with consummate skill in actual con-

struction. His most original work was in the attack (*see below*), which he reduced to a scientific method most certain in its results. It is therefore one of the ironies of fate that Vauban should be chiefly known to us by three so-called "systems," known as his "first," "second" and "third." How far he was from following a system is shown by de Villenoisy, who reproduces 28 fronts constructed by him between 1667 and 1698, no two of which are quite alike and most of which vary very considerably to suit local conditions.

Vauban's "first system," as variously described by other writers even in his own time, is pieced together from some of the early examples of his work. The "second system" is the "tower bastion" defence of Belfort and Landau (1684-88), obviously suggested by a design of Castriotto's 100 years earlier; and the "third system" is the front of Neu-Breisach (1698), which is merely Landau slightly improved. In other works, between 1688 and 1698, he did not keep to the tower bastion idea. It will be convenient to take the "first system," as reproduced in a text-book of fortification as typical of much of Vauban's best work. He sometimes uses the straight flank, and sometimes the curved flank with orillon. Parapets in several tiers are never used, nor cavaliers. The ravelin is almost always used. It is small, having little artillery power and giving no protection to the shoulders of the bastions. The tenaille is very generally found. In this form, viz., as a shield to the escarp of the curtain, it was probably invented by him. There were two forms. Traverses are used for the first time on the covered way to guard against enfilade fire; and the re-entering place of arms, to which Vauban attached considerable importance, is large. The main dimensions of the trace are indicated. As regards the profile the bastions and curtain have a command of 25ft. over the country, 17ft. over the crest of the glacis and 8ft. over the ravelin. The ditches are 18ft. deep throughout. The parapets are 18ft. thick with full revetments. In his later works he used demi-revetments.

After Vauban died, though the theories continued, the valuable additions to the systems were few. Among his successors Cormontaigne (*q.v.*) formed a link with the school of Mézières, established in 1748, and from this time forward there was an official school of thought, based on Vauban. Cormontaigne's work, therefore, represents the modifications of Vauban's ideas accepted by French engineers in the latter part of the 18th century. The school of Mézières was afterwards replaced by that of Metz, which carried on its traditions. Such schools are necessarily conservative, and hence, in spite of the gradual improvement in ordnance and firearms, we find the main elements of the bastioned system remaining unchanged right up to the period of the Franco-German war in 1870. Chasseloup-Laubat tells us that, before the Revolution, to attempt novelties in fortification was to write one's self down ignorant. As, therefore, the official view was that the general outlines of the system were sacred, the efforts of orthodox engineers from Cormontaigne's time onwards were given to improvements of detail, and mainly to retard breaching operations as long as possible. Among the unorthodox two names deserve mention. The first of these is Chasseloup-Laubat (*q.v.*), who served throughout the wars of the Republic and Empire, and constructed the fortress of Alessandria in Piedmont. Chasseloup's main proposals to improve the bastioned system were two: First, in order to prevent the bastions from being breached through the gaps made by the ditch of the ravelin, he threw forward the ravelin and its keep outside the main glacis. This had the further advantage of giving great saliency to the ravelin for cross-fire over the terrain of the attack. On the other hand, it made the ravelin liable to capture by the gorge, and thus was dangerous for a weak or inactive garrison. Secondly, in order to get freedom to use longer fronts than those admissible for the ordinary bastioned trace, he proposed to extend his exterior side up to about 650yd. and to break the faces of his bastions; the portion next the shoulder being defended from the flank of the collateral bastion and coinciding with the line of defence, and the portion next the salient, up to about 80yd. in length, being defended from a central keep or caponier placed in front of the tenaille. The natural criticism of this arrangement is that it combines some of the defects of both the bastioned and polygonal

systems without getting the full advantages of either.

The second name is that of Capt. Choumara of the French Engineers, born in 1787, whose work was published in 1827. Two leading ideas were due to him. The first is that of the "independence of parapets." By making the crest of the parapet quite independent of the escarp line he obtained great freedom of direction for his fire. The second idea is that of the "inner glacis." This was a glacis parapet placed in the main ditch to shield the escarp; its effect being to prevent the escarp of the body of the place from being breached in the usual way by batteries crowning the crest of the covered way. The need for Choumara's improvements has passed by, but he was in his time a real teacher. One sentence of his strikes a resounding note: "What is chiefly required in fortification is simplicity and strength. It is not on a few little contrivances carefully hidden that one can rely for a good defence. *The fate of a place should not depend on the intelligence of a corporal shut up in a small post prepared for his detachment.*"

It must here be remarked that the reproach of "geometrical" fortification is in no way applicable to the works of Vauban and his immediate successors. They excelled in adapting works to sites, the real test of the engineer. The bastioned system was the 17th-century solution of the fortification problem. Given an artillery and musketry of short range and too slow for effective frontal defence, a ditch is necessary as an obstacle. What is the best means of flanking the ditch and of protecting the flanking arrangements? If Vauban elected for the bastion, we must before criticizing his choice remember that he was the most experienced engineer of his day, a man of the first ability and quite without prejudice. What is matter for regret is that the authority of Vauban should have practically paralysed the French school during the 18th and most of the 19th century, so that while the conditions of attack and defence were gradually altering they could admit no change of idea, and their best men, who could not help being original, were struggling against the whole weight of official opposition. Again, the duplication of outworks often seen is not geometric fortification. It is a definite attempt to retard the attack, on ground favourable to it, by successive lines of defence.

The Dutch School.—From the end of the 16th century the Dutch methods of fortification acquired a great reputation, thanks to the stout resistance offered to the Spaniards by some of their fortresses, the three years' defence of Ostend being perhaps the most striking example. Prolonged defences, which were mainly due to the desperate energy of the besieged, were credited to the quality of their defences. Three conditions governed the development of the Dutch works at this time, viz., want of time, want of money and abundance of water. When the Netherlands began their revolt against Spain, they would no doubt have been glad enough of expensive masonry fortresses on such models as Paciotto's citadel of Antwerp. But there was neither time nor money for such works. Something had to be extemporized, and fortunately for them they had wet ditches to take the place of high revetted walls. Everywhere water was near the surface, and rivers or canals were available for inundations. High command was, owing to the flatness of the country, unnecessary and even undesirable, as it did not allow of grazing fire. What the Dutch actually did in strengthening their towns gives little evidence of system. Speaking generally, they endeavoured to provide for the want of a first-class masonry obstacle by multiplication of wet ditches, and further to strengthen these obstacles by great quantities of palisading, for which purpose the timber of old ships was used. They also recognized the inherent weaknesses of wet ditches, as, for instance, that when frozen they no longer provide an obstacle; and they studied the means, not only of causing inundations, but also of arranging to empty as well as to fill the ditches at will. Simon Stevin was the leader in this particular branch of the work.

Coehoorn (*q.v.*), the contemporary and nearest rival to Vauban, was the greatest light of the Dutch School. Like Vauban he was distinguished as a fighting engineer, both in attack and defence; but in the attack he differed from him in relying more on powerful artillery fire than systematic earth-works. He introduced the Coehoorn mortar.

German School.—The "tenaille" system and the "polygonal" system which grew out of it are mainly identified with the *German school*. It was founded on the principles of Dürer, Speckle and especially Rimpler, and much influenced in execution by Montalembert. "The German engineers desired a simple trace, a strong fortification with retrenchments and keeps, bomb-proof accommodation and an organization suitable for an offensive defence." These had always been the German principles. In the 16th century the Prussian defences of Kustrin, Spandau and Peitz had large bomb-proof casemates sufficient for a great part of the garrison. The same thing is seen in the defences of Glogau, Schweidnitz, etc., built by Frederick the Great. Whether through the influence of Albert Dürer or not cannot be said, but while the bastion was being developed in France the tenaille and the accompanying casemates from the first found acceptance in Germany, and thence in eastern and northern Europe. De Groote, who wrote in 1618, produced a sort of tenaille system, and may have been the inspiration of Rimpler. Others advocated both bastion and tenaille, sometimes in combination, the German bastion being usually distinguished by short faces and long flanks. Rimpler, who was present at the siege of Candia (taken by the Turks in 1669) and died at that of Vienna in 1683, exercised a great influence. He had been struck by the weakness of the early Italian bastions at Candia, and published a book in 1673 called *Fortification with Central Bastions*, which was practically the polygonal trace.

Landsberg the younger (1670-1746), a major-general in the Prussian service, appears to have been the first who frankly advocated the tenaille alone, chiefly on the ground that the flank, which was the most important part of the bastioned system, was also the weakest. It was, however, ultimately a Frenchman, Marc René Montalembert (*q.v.*), who was the great apostle of the tenaille, though in his later years he leaned more to the polygonal trace. He objected to the bastioned trace on many grounds; principally that the bastion was a shell trap, that the flanks by crossing their fire lost the advantage of the full range of their weapons, and that the curtain was useless for defence. His tenaille system consisted of redans, with salient angles of 60° or more, flanking each other at right angles; from which he gave to his system the name of "perpendicular fortification."

Lazare Carnot (*q.v.*), the "Organizer of Victory," was, in fortification, a follower of Montalembert, and produced in 1797 a tenaille system on strong and simple lines.

Carnot was also, like Coehoorn, a great believer in the mortar; but while Coehoorn introduced the small portable mortar that bears his name, Carnot expected great results from a 13in. mortar throwing 600 iron balls at each discharge. He endeavoured to prove mathematically that the discharge of these mortars would in due course kill off the whole of the besieging force. These mortars be emplaced in open fronted mortar casemates, in concealed positions. The main idea of Montalembert was that for a successful defence it was necessary for the artillery to be superior to that of the enemy. This idea led him to the adoption of casemates in several tiers; in preference to open parapets, exposed to artillery fire of all kinds, high angle, ricochet and reverse. In considering the defects of bastions he had arrived at the conclusion that for flanking purposes two forms of trace were preferable; either the tenaille form, or that in which the primary flanking elements, instead of facing each other with overlapping fire, as with the bastions, should be placed back to back in the middle of the exterior side. With his central flanking work Montalembert laid the foundation of the polygonal system.

Montalembert was one of the first to foresee the coming necessity for detached forts, and it was for these that he chiefly proposed to use his caponier flanking, preferring the tenaille system for large places. In abandoning the bastioned trace he was already committed to the principle of casemate defence for ditches. Montalembert is said to have contributed more new ideas to fortification than any other man; sometimes unsound, all the best work of the 19th century rests on his teaching. The Germans, who already used the tenaille system and made free provision of bomb-proof casemates, took from him the polygonal trace and the idea of the entrenched camp. The polygonal system in fortification implies

straight or slightly broken exterior sides, flanked by casemated caponiers. The essence of the system is its simplicity, which allows of its being applied to any sort of ground, level or broken, and to long or short fronts.

Entrenched Camps.—The final period of smooth-bore artillery is an important one in the history of fortification. It is true that the many expensive works that were constructed at this time were obsolete almost as soon as they were finished; but this was inevitable, thanks to the pace at which the world was travelling. After the Napoleonic wars the Germanic confederation began to strengthen its frontiers, and took up Montalembert's idea of entrenched camps, utilizing at the same time his polygonal system for the main enceintes.

The Detached Fort.—We have now reached a period when the "detached fort" becomes of more importance than the organization of the enceinte. The early conception of the rôle of detached forts in connection with the fortress was to form an entrenched camp within which an army corps could seek safety if necessary. The idea had occurred to Vauban, who added to the permanent defences of Toulon a large camp defended by field parapets attached to one side of the fortress. The substitution of a ring of detached forts gave a wider area and freer scope for the operations of an army seeking shelter under the guns of a fortress, and at the same time made siege more difficult by increasing the line of investment. The use of the detached fort as a means of protecting the body of the place from bombardment had not yet been made necessary by increased range of artillery. When these detached forts were first used by Germany the scope of the idea had evidently not been realized, as they were placed much too close to the fortress. Those at Cologne, for instance, were only some 400 or 500yd. in advance of the ramparts. Clearer views and real progress came largely through Gen. von Brese-Winiari, inspector-general of the Prussian engineers.

France, for a few years after 1815, could spare little money for fortifications, and nothing was done but repairs and minor improvements on the old lines. Belgium, having some money in hand, rebuilt and improved in detail a number of bastioned fortresses which had fallen into disrepair. In 1830 France began to follow the lead of Germany with entrenched camps. The enceinte of Paris was reconstructed, and detached forts were added. The Belgian and German frontiers of France being considered fairly protected by the existing fortresses, they turned their attention to the Swiss and Italian frontiers, and constructed three fortresses with detached forts at Belfort, Besançon and Grenoble. The enceinte was simplified on account of the advanced defences. That of Paris, which was influenced by political considerations, was a simple bastioned trace with rather long fronts and without outworks. As regards the detached forts there was certainly a want of clearness of conception. Those of Paris were simply fortresses in miniature, square or pentagonal figures with bastioned fronts and containing defensible barracks.

Period from 1855 to 1870.—During the period 1855-70 a considerable impulse was given to the science of fortification, both by the Crimean War and the arrival of the rifled gun. One immediate result of these was the condemnation of masonry exposed to artillery fire. The most important work of the period was the new scheme of defence of Antwerp which was initiated in 1859. This is chiefly interesting as giving us the last and finest expression of the mediæval enceinte, at a time when the war between the polygonal and bastioned traces was still raging, though the boom of the long-range guns had already given warning that a new era had begun. The defences of Antwerp were designed, as the strategic centre of the national defence of Belgium, for an entrenched camp for 100,000 men. The length of the enceinte was nine miles. The detached forts, which on the sides not defended by inundation were about one and a quarter miles apart and from two to three miles in front of the enceinte, were arranged for garrisons of 1,000 men. In the same year the land defences of some of the British dockyards were taken in hand. These first serious attempts at permanent fortification in England were received with approval on the Continent, as constituting an advance on anything that had been done before. The detached forts intended to keep an enemy

outside bombarding distance were roomy works with small keeps. The parapets were organized for artillery and the ditches were defended by caponiers or counterscarp galleries. The forts were spaced about a mile apart and arranged so as to support each other by their fire.

Period from 1870 to 1885.—The effect of the Franco-German War of 1870 was to concentrate attention on detached forts. These were thrown out to a greater distance, and the typical shape adopted both in France and Germany was a very obtuse-angled *hnette*, shallow from front to rear. While the German type had one parapet only, the French forts had two parapets, that in the rear being placed over living casemates to command the front one. There was a long controversy as to whether the artillery of the fort should be on the upper or the lower parapet, the advocates of the upper parapet attaching great importance to the command that the guns would have over the country in front. The other school, objecting to having guns on the skyline, preferred to sacrifice the command and place them on the lower parapet, the infantry occupying the line of upper parapet. It will be observed that the bastioned trace is abandoned, the ditches, like those of the German fort, being defended by caponiers.

While a great deal of work was done on these lines, a very active controversy had already begun on the general question as to whether guns should be employed in forts at all. Some declared that the accuracy and power of artillery had already developed so far that guns in fixed and visible positions would be put out of action in a very short time. The remedy proposed by these was the removal of the guns from the forts into "wing-batteries" which should be less conspicuous; but soon the broader idea was put forward of placing the guns in concealed positions and moving them from one to another by means of previously prepared roads or railways. Others declared that there was no safety for the guns outside the forts, and that the use of steel turrets and disappearing cupolas was the only solution of the difficulty. Gen. Brialmont, who had by this time become the first European authority on fortification questions, ranged himself on the side of the turrets. The younger school, however, pinned their faith to mobility, and pleaded for it vehemently in numerous publications.

MODERN PERMANENT FORTIFICATION

In the last quarter of the 19th century, two events changed the whole outlook on permanent fortification. One, not fully appreciated at the time, was the power of the breech-loading rifle, in conjunction with improvised field works, of stopping an infantry attack, the other the introduction of high explosive shell.

Breech-loading Rifles and High Explosive Shells.—The former was strikingly manifest in the defence of Plevna by the Turks in 1877. The defences, which mainly consisted of small infantry redoubts with artillery in separate battery positions, were only constructed after the first Russian attack. The redoubts, surrounded by a 10ft. ditch, were square in plan, with parapets 10 to 15ft. above the ground and 14ft. thick. They had a certain amount of head cover of timber and earth and were connected by trenches 4ft. deep. In spite of suffering considerably from artillery bombardment, these works, stubbornly defended by the Turks with breech-loading rifles, held out against all assaults. After five months, it was only through lack of supplies that Plevna capitulated.

The Germans in about 1884 had begun experiments with long shell containing large charges of gun cotton. But it was the experiments at Ft. Malmaison in France in 1886 that set the military world speculating on the future of fortification. The fort was used as a target for eight-inch shell of five calibres length containing large charges of melinite. The reported effects of these made a tremendous sensation, and it was at first thought that the days of permanent fortification were over. Magazine casemates were destroyed by a single shell, and revetment walls were overturned and practicable breaches made, by two or three shells falling behind them. It must be remembered, however, that the works were not adapted to meet this kind of fire. The casemates had enough earth over them to "tamp" the shell thoroughly (*i.e.*, increase its power by confining and concentrating its effect), but

not enough to prevent it from coming into contact with the masonry, and the latter was not thick enough to resist the explosion of the big charges. After the first alarm had subsided, foreign engineers set about adapting their works to meet the new projectiles. Revetments were enormously strengthened, and designed so that their weight resisted overturning. Concrete roofs were made from six to ten feet thick and in many cases the surface of the concrete was left bare so as to expose a hard surface to the shell without tamping.

Successive Fortifications of Metz up to 1899.—Of the fortresses that were strengthened to meet the new conditions Metz is a good example. In 1868–70 detached forts of bastion trace, such as St. Julien (Manteuffel) were built within 3,000yd. of the old enceinte, which was left unaltered. After 1870 the Germans added forts of the polygonal type, such as Prinz Auguste, with wing batteries to reinforce the intervals. Later the perimeter was strengthened by infantry positions, shelters and armoured batteries. Finally in 1899 the more modern forts of Sauley and Pont du Jour, 9,000yd. from the place, were commenced. The distances of the detached forts from the place were thus being increased to keep pace with the range of siege howitzers. The minimum distance was considered to be 8,000yd. In practice, however, the position of the forts had to be determined by the lie of the ground. At Verdun the distances varied from 3,000 to 12,000yd., Bucharest 8,000 to 12,000, Copenhagen 8,000 to 10,000 and Paris 15,000 to 18,000. With the extension of the perimeter came the increased difficulty of defending the intervals between the forts. The flanking fire of some of the guns in the forts played an important part, but the main defence rested on a chain of redoubts and infantry positions with fire trenches, obstacles, bomb-proof shelters and communications, between the forts. To stop infiltration and as the last line of the "step by step" defence the enceinte where possible was retained. This was done more as a concession to tradition than for any solid reason, as it would be impracticable to enclose a modern town with a continuous enceinte, and if provided it would hardly be a favourable position for the last stage of a defence.

Although the forts were all designed to contain guns of the safety armament (*i.e.*, permanently in position ready to come into action as soon as war broke out) it was realized that for protracted defence a considerable force of artillery outside the forts would be required. If positions were prepared before-hand with concrete or armour considerable expense would be entailed, and the dispositions would be fixed without reference to the enemy's front of attack. A compromise was therefore effected, only the most important batteries being completely protected, while positions for the remainder were prepared and the necessary communications made.

Types of Detached Forts.—Of the many types of detached forts, there may be mentioned forts designed without any covered way, which showed that offensive action was no longer expected from the garrison of the fort but was the duty of troops in the intervals. On account of the difficulty of building a revetment strong enough to withstand breaching fire the scarp was usually omitted. The slope of the rampart was carried down to the bottom of the ditch and protected with a steel fence and wire entanglement obstacles.

Armour.—It will be noticed that armour is included in many modern examples. In 1860 Brialmont had employed armoured turrets at Antwerp in the forts which commanded the Scheldt. But for land purposes engineers were slow to adopt it. It was thought that the deliberate fire of a battery on land would be so accurate that, with successive blows, it could break down the resistance of the strongest shield. When this was not found to be the case, opinion turned and practical types of cupolas were produced. It was argued that the object of fortifications is not to obtain resisting power without limit, but to enable men to defend themselves and use their weapons for as long as possible against a superior force, and that from this point of view armour adds strength to defensive works. Of the various forms of armour, revolving cupolas with flattened domed tops are generally used. Turrets which are cylindrical with flat tops are more conspicuous and pre-

sent vertical targets. They both emerge from a mass of concrete which is strengthened round the opening with a collar of steel. Casemates and shielded batteries, in which guns fire through a fixed embrasure or port hole, are considerably cheaper, and have the greater strength of a fixed structure. But the arc of fire of the gun is very limited and the embrasures, which are the weakest points of the system, are—except in the case of Bourge case-

FIG. 9.—REVOLVING AND DISAPPEARING STEEL CUPOLA FOR A PAIR OF 3-IN. GUNS

mates for flanking batteries—constantly exposed to the fire of the enemy. They are, however, well suited for flanking batteries and for barrier forts, where the Italians have used them for the end of the Mont Cenis tunnel.

Fig. 9 shows a cupola for a pair of 3-in. guns. The shield is of nickel steel. The guns are muzzle pivoting and the cradles are thickened out near the muzzle so as to close the port as much as possible. The recoil is curtailed within narrow limits so as to economize space. To facilitate elevation the breech of the gun (with muzzle pivoting the breech has, of course, to be moved through a much larger arc than with ordinary mounting) is balanced by a counter-weight. The cupola is raised and lowered by means of a lever and counter-weight and can be locked in the raised position. It can be turned through a complete circle in about one minute.

Of all the countries that adopted armour it was Rumania that used it the most. Bucharest was defended by 18 main armoured forts (designed by Brialmont) some 4,500yd. apart and 11,000 to 12,000yd. from the town, with 18 small forts and intermediate batteries. The typical armament of a main fort was six 6 in. guns in three cupolas, two 8.4 in. and one 4.7 in. howitzer in cupolas and six small Q. F. guns in disappearing cupolas. For the defence of the Sereth line where the three Russian lines of advance across the river passed through Focshani, Nemolassa and Galatz, the "Schumann system of armoured fronts" (1889-92) was adopted. This system dispensed entirely with forts and relied on the fire of protected guns disposed in several lines of batteries of Q. F. guns and howitzers in cupolas. In the Focshani works there were 71 batteries on a 12 m. semicircular front, disposed in three lines about 500 yd. apart and divided into groups. The normal group consisted of five batteries, three in the first line each consisting of five small Q. F. guns on travelling mountings, one in the second line of six Q. F. guns in disappearing cupolas, and one in the third line of a 5 in. gun in a cupola and two 8.4 in. shielded mortars. The immediate defence of the batteries consisted of a glacis planted with thorn bushes and a wire entanglement. It was claimed that with this system an attack could be

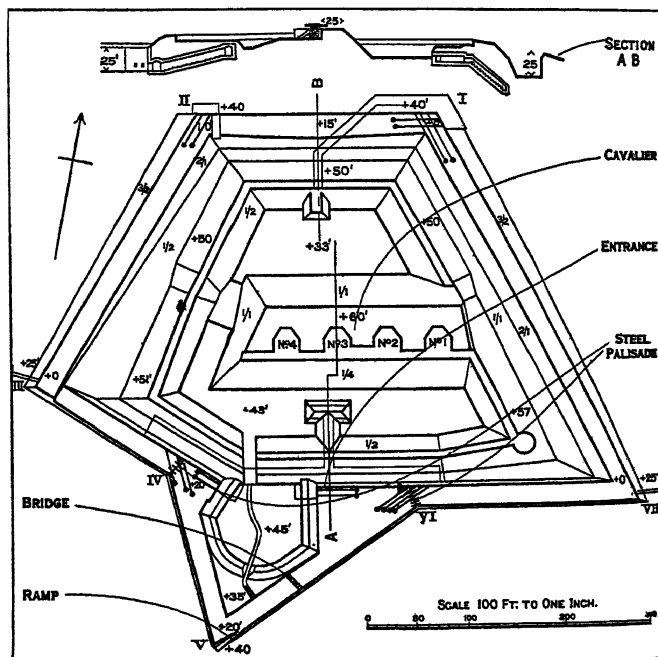

stopped by artillery fire alone, but the difficulties of command, fixed battery positions, and lack of infantry defence, especially at night, or in a mist, were sufficient to condemn it by all authoritative Continental opinion.

Unarmoured Systems.—While European nations were including armour in their permanent fortifications, there were many distinguished soldiers entirely opposed to its use. In England Maj. G. S. Clarke, R.E. (now Lord Sydenham) published in 1900 a notable book on *Fortification*. He condemned the inclusion of artillery in forts which formed conspicuous and easy targets, and for the defence, advocated strong permanent infantry redoubts supplemented by field defences. These guaranteed the safety of the guns behind them, which could then dispense with armour and take every advantage of concealment, alternative positions and mobility. With guns in detached forts, a compromise had to be effected between the most suitable infantry and artillery positions, to the detriment of both. When separated, the infantry redoubt could be sited in the best tactical position to give effect to rifle and machine gun fire, while the guns were placed in concealed positions in rear. It was only in the special case of barrier forts that he considered armour necessary.

In a typical infantry redoubt of the kind suggested, the form is simple and in order to reduce the chance of being hit the plan is shallow. Invisibility is secured by low command, easy slopes and the judicious planting of trees. If it is intended for 300 men, there is shell proof accommodation under the parapets for three-quarters of the garrison. A parapet is provided for frontal fire but there are no traverses.

Port Arthur.—Out of the welter of theory and experiment Port Arthur in 1904 was the first fortress to be put to the test of modern war. Although designed in 1900 the permanent defences, as can be seen from the plan of Fort Erh-Lung (fig. 10), were of the 1870 type of detached fort.

Owing to the lack of funds only three forts on the north-east side had been built, while to the north-west, the important position

FROM COMMITTEE OF IMPERIAL DEFENCE, "OFFICIAL HISTORY OF THE RUSSO-JAPANESE WAR" (CONTROLLER OF H.M. STATIONERY OFFICE)

FIG. 10.—PLAN OF FORT ERH-LUNG, PORT ARTHUR, DESIGNED IN 1900

of 203-Metre Hill (fig. 15) had no permanent defences. In spite of the fire of the new Japanese 11 in. siege howitzers, and of the most determined attacks the siege lasted five months (see PORT ARTHUR). The guns in the forts, on account of their conspicuous position, were soon silenced; but the forts themselves, surrounded by deep ditches cut out of solid rock, held out against repeated assaults until blown to pieces by mining. The great stopping power of rifles and machine guns from improvised defences, even when

subjected to the fire of heavy howitzers, was again brought out. This power is increased when the line is strengthened by permanent infantry forts with deep ditches. To coop up artillery in conspicuous infantry forts is a mistake, and the weakness of a linear defence on the observation line and without depth is apparent. If one position is captured the remainder of the line can be taken in flank and rendered untenable.

Infantry redoubts having proved their value as keystones of the defensive line, Schroeter in 1905 proposed a new variation of this

FIG. 11.—A. MAIN INFANTRY WORKS. B. CONCRETE CASEMATES. C1. ARMoured BATTERIES. (C5. DUMMY). D. ARTILLERY OBSERVATION POSTS. E. ARMoured INFANTRY OBSERVATION POSTS. F. POSTS FOR ENFILADING OBSTACLES AND DITCHES. G. INFANTRY LOOKOUT POSTS

type. The command in this case is lower than in Sir George Clarke's work, while the plan is more complicated and arrangements for close flanking defence have been introduced. These works, however, are the infantry supporting points in a line which contains forts of the triangular type with guns and armoured batteries. To obviate the weakness of this type of linear defence, and to protect the batteries from any penetration by the enemy between the redoubts, the Germans at Metz built a new form of fortified work known as the "feste." This, as its name indicates, is rather a self-contained fortress on a small scale than a fort in the old sense. The "festes" built just prior to 1914 covered a large irregular area some 1,200 yd. in depth and width. Within their wired perimeter were sited all the elements of the defence both for infantry and artillery. Strong self-contained infantry works were situated at each of the salient angles, while the batteries (generally 6 in. howitzers and 4 in. guns) were disposed within the area with their weapons in revolving steel cupolas embedded in concrete. Ditches 20 ft. deep, wired at the bottom and flanked by loopholed galleries, protected the outer face of the infantry works. Each battery and work was surrounded by wire and the main perimeter wire was sunk six feet deep and flanked by the redoubts. There were numerous steel and concrete command and observation posts for the artillery and infantry, and casemates protected by nine feet of concrete were provided for the whole garrison. Deep underground galleries and a complete telephone system connected the various parts of the "feste."

Developments of the 20th Century.—While land defences were thus being evolved, changes due to the great economic and industrial developments of the early 20th century were affecting not only the design but the rôle of permanent fortification. The conception of a fortress as a ring of defences protecting an important point, and capable of withstanding an investment unsupported by a field army, though by no means abandoned, was being

modified. The ring fortresses of the 19th century, which protected important places such as capitals and arsenals, and served as secure bases for field armies, or refuges for beaten ones, were no longer capable of fulfilling their rôle. These changes were due to two main reasons. Firstly, the increased size of armies provided by universal service necessitated the employment of several lines of communication, wide bases, and large areas for their concentration and deployment. Secondly, the greatly increased range and destructive power of artillery necessitated the extension of the perimeter to such a degree that for the defence of a fortress a field army was required. Zone fortification therefore was beginning to be established in the highly-organized industrial areas of Western Europe. Reliance, however, was still placed on self-sufficing girdle fortresses, such as Paris, Antwerp and Bucharest, and in the less organized areas of Russian Poland.

Use of Fortified Areas.—Before examining the history and trend of opinion on permanent fortification during and since the World War of 1914-18, it is advisable to consider the use and limitations of fortified areas. It is an axiom of war that victory can only be won as the result of offensive action, but a defensive attitude may at times be necessary or even advantageous. Fortresses can never win a victory; their rôle is to gain time and economize force. The main uses are:—(1) To delay the enemy on important lines of advance, such as the barrier forts of the Alpine passes, or the fort of Manonvillers, which commanded the main line of railway from Strasbourg to Paris; (2) to protect vital points such as Paris and Antwerp; (3) to canalize the attack and force the enemy, unless he wishes to spend the time and men necessary for the deliberate attack of fortresses, to advance by specified lines (the Trouée de Charmes between Toul and Epinal is an example); (4) to act as a pivot of manoeuvre. It was for this purpose that the Germans used the Metz-Thionville zone.

Fortresses in the War of 1914-18.—The comparatively rapid and shattering fall of the Belgian fortresses in 1914 caused a complete revulsion against permanent fortification. Liège with its 12 armoured forts fell 11 days after the opening attack, and eight days after the first use of the German 17 in. howitzers, while the centre of the town, with the vital bridges over the Meuse, was captured within the first three days. Namur withstood only four days' bombardment and four of the main Antwerp forts were rendered untenable in three. On the eastern frontier of France the barrier fort of Manonvillers was reduced to ruins in two days. The main fortress zones of Verdun-Toul and Epinal-Belfort were not seriously attacked except at the fort Camp des Romains, which the Germans captured and thus secured a crossing over the Meuse at St. Mihiel. On the other hand Maubeuge, with its permanent fortifications completely out of date and strengthened only by field works, held out for 11 days. As a result of these events, the French higher command decided to abandon the permanent forts of Verdun and to rely entirely on field defences. When the Germans attacked in Feb. 1916, Fort Douaumont was left undefended and charges were laid for the demolition of Fort Vaux; but the electric firing cables having been cut by shell fire, the demolition could not be carried out. Meanwhile it had been discovered that the concrete casemates and steel cupolas of the modern forts had suffered little damage from the heaviest shells. Gen. Pétain therefore ordered the forts to be re-occupied. The protected observation posts and shell-proof casemates were found to be of the greatest value, but the absence of the flanking guns which had been removed, and the lack of telephonic and underground communication to the rear, were severely felt. These forts were generally small—Vaux was designed for 150 men—and except for an occasional 75 or 155 mm. gun in a cupola for direct fire, and flanking guns in Bourges casemates, they contained no artillery. The forts were provided with concrete underground galleries and casemates, protected by masonry arches three feet thick, with a three foot cushion of sand between them and the main protective layer of eight feet of concrete; and were enclosed by ditches 30 ft. wide and 20 ft. deep.

On the German western frontier, in order to provide a pivot of manoeuvre for Von Schlieffen's plan for the invasion of France through Belgium, the defences of Metz had been strengthened and

extended to include Thionville, while 100 m. west of Strasbourg the fortress of Mutzig was built to close the Col de Saales road over the Vosges. These fortresses fulfilled their rôle but were never seriously threatened.

German-Austrian-Russian Frontier.—The fortresses of Poland and Galicia differed from those of France and Belgium in that they were purely ring fortresses, designed to hold the few and therefore very important road and railway junctions of Poland. Of these, Modlin (Nowo-Georgiewsk) was invested and rapidly fell by siege, Brest-Litovsk and Grodno fell as parts of the battle line, Deblin (Iwangozod) was evacuated by the threat of an encircling movement, while Przmysl alone, with the aid of field works, was successful in withstanding a siege. On the German frontier the fortresses of the Vistula-Torun (Thorn) and Grandenz were never attacked. Of the forward line, however, Königsberg held two Russian army corps from the battle of Tannenberg, and the small fortress of Lotzen with a strong line of field defences, flanked by the lakes, never gave way.

Effect of Bombardment on Forts.—The difference in the degree of resistance to shell fire shown by the various forts is remarkable. Manonvillers, though not entirely modern, with its two steel cupolas, disappearing 6 in. guns, and casemates protected by eight feet of ordinary concrete, became a blazing inferno under the rain of 17,000 shells directed upon it. The garrison, after two days, blinded by the dust and fragments, asphyxiated by the fumes of the constantly bursting shells, and almost demented by the concussion, were rendered quite incapable of defending the fort, which was captured by the Germans without the loss of a single man. The forts of Liège and Namur similarly, when subjected to the concentrated fire of 17 in. howitzers, were soon rendered untenable; casemates were penetrated, cupolas overturned and the whole structure reduced to ruins. On the other hand, the more modern forts of Verdun appeared to have withstood the heaviest bombardments without vital damage. French writers claim that of the steel cupolas only one was permanently destroyed. At Douaumont 13 out of the 18 casemates remained intact. Forts Moulainville and Vacherauville received 6,000 to 8,000 shells each, of which in the case of Moulainville, 330 were 17 in., without permanent damage to casemates or turrets. The difference in the resistance of the forts was due to the higher quality of the French concrete, which was mixed with a large proportion of cement, and laid with the greatest care to ensure the masses being monolithic without lines of cleavage, and also to the great thickness and large masses which are necessary to withstand the overturning and disruptive effects of bombardment. The French cupolas had 30 mm. thickness of steel compared with the 22 mm. of the Belgian ones. The Belgian forts were large, crowded, and conspicuous targets; they contained guns of the main artillery armament, and were sited on commanding positions. In spite of the lessons of Port Arthur, they were only built to withstand shells up to 8 in. The Italian barrier forts in the battle of the Isonzo failed because their armour and concrete were not sufficiently thick and there was no protection against gas, while the small Austrian works in the south of Tirol, although bombarded by 12 in. howitzers, held out for months.

Value of Permanent Works.—From the lessons of the World War there have again grown two schools of thought. On the one hand it is argued that the fortresses of the Franco-German frontier completely justified the money expended on them. By their existence they forced Germany to violate the neutrality of Belgium and so brought the British empire against her. The more modern forts proved their ability to resist bombardment by the heaviest shells and saved many casualties. Verdun, as a pivot of the battle line, was of incalculable value during the decisive battle of the Marne, and later as a bastion in the trench system. Liège, in spite of its comparatively rapid fall, gained the allies at least four days, enabled the French army to change front and the British to come into line. Paris as a pivot of manoeuvre, forced the German invasion westwards and so exposed their flank to Manoury's attack. Antwerp kept two German corps from the decisive front, and "every day gained at Antwerp meant a French port saved."

Maubeuge, Przmysl and Königsberg all detained important forces from the battles of the Marne, Cracow and Tannenberg. Strasbourg and Metz-Thionville fulfilled their rôle as a pivot for the German wheel. The expenditure on keeping these fortresses up to date was not great. The average annual amount spent on the defences of Verdun and the heights of the Meuse for the 40 years prior to the war was £200,000, i.e., less than the cost of a destroyer; while the total spent on Metz was about equal to the cost of a battleship. Battleships are not expected to last more than 12 or 15 years; they are then considered obsolete and replaced. The other school of thought point out that the inherent weakness of fortresses is in their immobility. Once built they remain, and when war comes may not be in the right place. Their position and extent are accurately known. They rapidly fall out of date and are expensive and difficult to renew. Apart from the expense involved, their reconstruction is a heavy feat of engineering, and not only takes time but frequently renders them useless for the period of the repairs. In 1914 four of the principal works of Belfort were out of action, as they were being rebuilt. New weapons for their destruction are rapidly invented and made. Manonvillers, Liège, Namur and Modlin (Nowo-Georgiewsk) were destroyed with ease and rapidity. Reliance based on the security afforded by fortresses may be a delusion. Of the three great entrenched camps of Antwerp, Paris and Bucharest, designed as a refuge for the Government and army, not one performed its rôle. Antwerp, on which much money had been expended, and considered by the Belgian nation as up to date, was given up by the field army and Government as soon as it became a question of withstanding a siege or continuing the war in the open. Bucharest was surrendered as the result of a battle in the foreground; while Paris, though valuable as a pivot of manoeuvre, was evacuated by the Government. Field defences, by their concealment, dispersion and facility for rapid renewal, are just as effective for defence as permanent fortification. It was not the permanent forts of Verdun and Przmysl but the trench lines of the advanced position and intervals that stopped the enemy. At Verdun the important tactical position of Mort Homme, defended by nothing but field defences, held out against the heaviest bombardments and attacks for six weeks, and caused the attackers terrible casualties. The expenditure is undoubtedly great, and the money could be more profitably spent on the field army, as, if the field army is overwhelmed the fortresses must fall.

Conclusions Drawn from the War of 1914-18.—It is evident that fortress areas, even when not attacked, fully justified their existence, but ring fortresses are obsolete. It was not Verdun the fortress, but Verdun as a solid bastion of the battle line, that resisted all assaults. The immense perimeter, now necessary to protect vital spots against long range guns, requires a large garrison; and for the ammunition and supply of this garrison for any length of time, railway communication must be kept open. There are, however, rare occasions when for political reasons it may be necessary to hold a ring fortress for a limited time. In the northern salient of Poland it is conceivable that the Poles, for political reasons alone, might wish to retain command of Vilna, while withdrawing from the remainder of the salient until their field army was ready to advance. Fortress areas equipped with concrete and armoured forts are expensive and slow to build; if they fail to gain the time they were calculated to gain, or require for their defence more men than the enemy would require to mask or neutralize them, they have been built in vain.

The value of field defences is undoubtedly very great. They can be rapidly made in accordance with the latest tactical ideas and sited in positions found most suitable at the time. With well sited machine guns, anti-tank guns and obstacles, covered by the fire of artillery (itself protected by mobility and concealment) positions have considerable power of resistance. But it must be remembered that in 1918 when attacked by tanks and unlimited artillery ammunition, even the strongest trench lines often failed to stop an attack. After the declaration of war, time may not be available to prepare them. There are occasions when material defensive preparations in peace time will have to be made and areas held for military, political or industrial reasons. Munitions play so

vital a part in modern war that the retention of certain areas of manufacture or supply may be essential. In other places, where for purely military reasons it might be wiser to withdraw and demolish the communications, public opinion may insist on a forward position being held. Again, the effect of the systematic destruction of industrial areas by an invader is now so great, that victory even cannot efface all trace of his presence. Every effort will therefore be made to fight on the enemy's ground. But to protect areas until the effect of the offensive is felt and to economize men so that the striking force is a maximum, some form of permanent fortification built in peace time, will at times and in certain places be required. Expense is a governing factor and new weapons and material will affect its form.

New Weapons and Material.—Of the recent innovations in weapons and material, gas and ferro-concrete have added strength to the defence. By means of gas inundations and gas shell bombardments, the favourable lines of advance can be denied to the attackers, while the defenders, in gas-proof works supplied with pure air, are immune. The adoption of ferro-concrete for defence works adds considerably to their resistance to shell fire. Four feet of ferro-concrete is proof against 6in. shell and 6ft. will withstand bombardment by shells up to 15in. To resist overturning, however, the concrete must be used in large masses. When made with quick hardening aluminous cement, ferro-concrete works can be taken into use 48 hours after completion. Tanks and aircraft on the other hand, by their mobility and capacity for surprise attack, have added to the difficulties of the defence. Cross-country armoured vehicles can attack rapidly over long distances and over any ordinary country except mountains, marshes and thick woods. They can cross wire entanglements and require special obstacles to stop them; so that land mines, vertical faced ditches and ferro-concrete blockhouses containing anti-tank guns, will be required for the defence. Aircraft compel the defenders to conceal and disperse defences to a far greater degree than formerly, and cover has to be provided against aerial bombs, which at present weigh up to 2,000 lb. The fire of super-heavy artillery, directed by air observation from railway or semi-mobile mountings, causes more damage to the fixed defences of the defender than to the attack, while by sound-ranging and flash-spotting methods the defender's guns, if in protected battery positions, and therefore limited in number, can be more easily located than those of the attacker.

The devastation of areas and complete destruction of communications is a powerful weapon of defence. This can seldom be completely carried out in industrial areas, but in less developed countries or where communications or water supplies are restricted, thorough and complete demolition will cause a modern army considerable delay. The thorough demolition of a tunnel, especially if supplemented by the use of delay action mines, will take months to repair, and the delay caused may be greater than that effected by a barrier fort. In 1918 the destruction of the bridges, roads and railways by the retreating German armies often delayed the Allies more than their resistance; and had the communications, in the area between Maubeuge and the Ardennes in 1914, been totally destroyed, the effect would have been far-reaching.

Future Form of Permanent Fortification.—In mountainous countries or areas where communications are limited, barrier forts, coupled with the destruction of roads and railways, will be used. But generally fortification will take the form of zones of defence, without large permanent works. Where the flanks can be made secure, as with the Chatalja lines of Constantinople, or the Viborg isthmus of Finland, between Lake Ladoga and the Gulf, a fortified zone will have great strength. In other cases extensive zones will be used as pivots of manoeuvre, and as protected areas for munitions, aerodromes, centres of communication, etc., safe against attack by mechanized forces. Within these zones the fortifications will not take the form of elaborate forts, but will consist of dispersed and concealed tank proof localities, with the intervals between them well covered by obstacles and the fire of all arms. The amount of material preparation made in peace time, will vary according to the degree of readiness required, but complete and detailed plans and schemes of defence will be made out and large scale maps prepared. Arrangements will be made

for communications and depots of material so that work can be carried out at short notice; and for the defence schemes to be revised periodically and brought up to date, to keep pace with modern requirements. When it is decided that for military, economical or political reasons, some degree of permanent fortification in peace time is necessary, the limitation of military expenditure will control the amount that can be carried out. Within these limits the following will be considered:

(a) The provision of an obstacle against a "coup de main" carried out by cross-country armoured vehicles. Waterways and inundations such as those of Fortress Holland or the Yser afford protection, while judicious afforestation would limit the lines of approach.

(b) Arrangements for air defence; gun and searchlight emplacements, telephonic communication, and sound-location installations.

(c) The provision of observation posts, command posts, machine and anti-tank gun positions—concealed, dispersed, protected by ferro-concrete or armour and connected by buried telephone cables.

(d) Afforestation to give cover from aeroplane observation, and the control of building and planting so as to keep clear the field of fire or view.

(e) Increase of road, rail and tramway communications.

(f) Landing grounds for aircraft, provided with sunken sites for hangars to minimize the lateral effect of air bombs.

(g) The selection of battery positions, organization of infantry tank proof localities, provision of obstacles, shell-proof cover in ferro-concrete shelters or deep dugouts, and subways. Arrangements for gas proofing and the supply of pure air and electric lighting of all works, etc.

Whatever the form or degree of fortification adopted may be, one can seldom rely on the theory of complete protection, or say, like Pétain at Verdun, "Ils ne passeront pas." To gain time and economize force are the objects of fortification, and the essence of defence lies in organization, concealment, observation, communication and the stout hearts of well-armed men.

(E. H. K.)

THE ATTACK OF FORTRESSES

In considering the history of siegecraft since the introduction of gunpowder, there are three main lines of development to follow, viz., the gradually increasing power of artillery, the systematizing of the works of attack and in recent times the change that has been brought about by the effect of modern small-arm fire.

Cannon appear to have been first used in sieges as mortars, to destroy hoardings by throwing round stones and barrels of burning composition. Early in the 15th century we find cannon throwing metal balls, not only against hoardings and battlements, but also to breach the bases of the walls. It was only possible to work the guns very slowly, and archers or crossbowmen were needed in support of them, to drive the defenders from the crenellations or loopholes of the battlements. At that period the artillery was used in place of the mediaeval siege engines and in much the same manner. The guns of the defence were inaccurate and incapable of adequate depression so that the besieger could place his guns close to the walls, with only the protection of a few large gabions filled with earth, set up on the ground on either side of the muzzle.

In the course of the 15th century the power of artillery was largely increased, so that walls and gates were destroyed by it in an astonishingly short time. Three results shortly followed. The guns of the defence having gained equally in effectiveness, greater protection was needed for the attack batteries; bastions and outworks were introduced to keep the besieger at a distance from the inner walls; and the walls were sunk in ditches so that they could only be breached by batteries placed on the edge of the glacis. Early in the 16th century fortresses were being remodelled on these lines, and the difficulties of the attack were at once increased. The tendency of the assailants was still to make for the curtain, which had always been considered the weak point; but the besiegers now found that they had to bring their guns right up to the edge of the ditch before they could make a breach, and

in doing so had to pass over ground which was covered by the converging fire from the faces of the bastions. Towards the end of the century the attack of the curtain was still more delayed and the cross-fire over the ground in front increased by the introduction of ravelins.

Siegecraft Before Vauban.—Gradually the whole problem of siege work centred round the artillery. The besiegers found that they had first to bring up enough guns to overpower those of the defence; then to advance their guns to positions from which they could breach the walls; and throughout these operations to protect them against sorties. Breaches once made, the assault could follow on the old lines. The natural solution of the difficulty of approach to the battery positions was the use of trenches. The Turks were the first to make systematic use of them, having probably inherited the idea from the Eastern empire. The soldiers of Western Europe, however, strongly disliked digging, and the difficulty was dealt with in a manner reminiscent of the feudal ages, by impressing large bodies of peasantry as workmen whenever a siege was in contemplation. Through the 16th and most of the 17th century, therefore, we find the attack being conducted by means of trenches leading to the batteries, and supported by redoubts often called "places of arms" also made by trench work. During this period the result of a siege was always doubtful. Both trenches and batteries were arranged more or less at haphazard without any definite plan; and naturally it often happened that offensive action by the besieged against the trenches would disorder the attack and at times delay it indefinitely.

Another weak point about the attack was that after the escarp walls had been strengthened to resist artillery fire as has been described, there was no clear idea as to how they should be breached. The usual process was merely an indiscriminate pounding from batteries established on the crest of the glacis. Thus there were cases of sieges being abandoned after they had been carried as far as the attempt to breach. It is in no way strange that this want of method should have characterized the attack for two centuries after artillery had begun to assert its power. At the outset many new ideas had to be assimilated. Guns were gradually growing in power; sieges were conducted under all sorts of conditions, sometimes against mediaeval castles, sometimes against various and widely differing examples of the new fortification; and the military systems of the time were not favourable to the evolution of method. It is the special feature of Vauban's practical genius for siege warfare that he introduced order into this chaos and made the issue of a siege, under normal conditions, a mere matter of time, usually a very short time.

Vauban's Teaching.—The whole of Vauban's teaching and practice cannot be condensed into the limits of this article, but special reference must be made to several points. The most important of these is his general arrangement of the attack. The ultimate object of the attack works was to make a breach for the assaulting columns. To do this it was necessary to establish breaching batteries on the crest of the glacis; and before this could be done it was necessary to overpower the enemy's artillery. In Vauban's day the effective range of guns was 600 to 700 yards. The first object of the attack, therefore, after the preliminary operations of investment, etc., had been completed, was to establish batteries within 600 or 700 yd. of the place, to counter-batter or enfilade all the faces bearing on the front of attack; and to protect these batteries against sorties. After the artillery of the defences had been subdued—if it could not be absolutely silenced—it was necessary to push trenches to the front so that guns might be conveyed to the breaching positions and emplaced there in batteries. Throughout these processes it was necessary to protect the working parties and the batteries against sorties.

For this purpose Vauban devised the *Places d'armes* or *lignes parallèles*. He tells us that they were first used in 1673 at the siege of Maestricht, where he conducted the attack, and which was captured in 13 days after the opening of the trenches. The object of these parallels was to provide successive positions for the guard of the trenches, where they could be at hand to repel sorties. The latter were most commonly directed against the trenches and batteries, to destroy them and drive out the working

parties. The most vulnerable points were the heads of the approach trenches. It was necessary, therefore, that the guard of the trenches should be in a position to reach the heads of the approaches more quickly than the besieged could do so from the covered way. This was provided for as follows. The first parallel was usually established at about 600 yd. from the place, this being considered the limiting range of action of a sortie. The

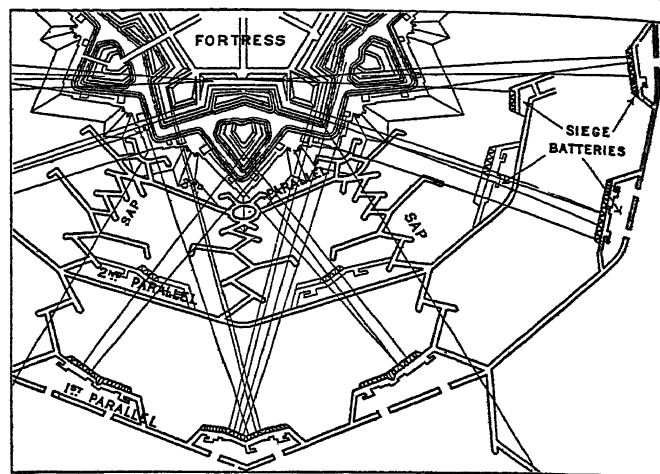

FIG. 12.—REGULAR ATTACK ON A FORTRESS (VAUBAN'S SYSTEM)

parallel was a trench 12 to 15 ft. wide and 3 ft. deep, the excavated earth being thrown forward to make a parapet three or four feet high. In front of the first parallel and close to it were placed the batteries of the "first artillery position."

While these batteries were engaged in silencing the enemy's artillery, for which purpose most of them were placed in prolongation of the faces of the fortress so as to enfilade them, the "approach trenches" were being pushed forward. The normal sector of attack included a couple of bastions and the ravelin between, with such faces of the fortress as could support them; and the approach trenches (usually three sets) were directed on the capitals of the bastions and ravelin, advancing in a zigzag so arranged that the prolongations of the trenches always fell clear of the fortress and could not be enfiladed.

Fig. 12, taken from Vauban's *Attack and Defence of Places*, shows clearly the arrangement of trenches and batteries.

After the approach trenches had been carried forward nearly half-way to the most advanced points of the covered way, the "second parallel" was constructed, and again the approach trenches were pushed forward. Midway between the second parallel and the covered way, short branches called *demi-parallèles* were thrown out to either flank of the attacks; and finally at the foot of the glacis came the third parallel. Thus there was always a secure position for a sufficient guard of the trenches. Upon an alarm the working parties could fall back and the guard would advance. Trenches were either made by *common trenchwork*, *flying trenchwork* or *sap*. In the first two a considerable length of trench was excavated at one time by a large working party extended along the trench: flying trenchwork (formerly known as flying sap) being distinguished from common trenchwork by the use of gabions, by the help of which protection could be more quickly obtained. Both these kinds of trenchwork were commenced at night, the position of the trench having been previously marked out by tape. The "tasks" or quantities of earth to be excavated by each man were so calculated that by daybreak the trench would afford a fair amount of cover. Flying trenchwork was generally used for the second parallel and its approaches, and as far beyond it as possible. In proportion as the attack drew nearer to the covered way, the fire of the defenders' small arms and surviving artillery naturally grew more effective, and it became necessary before reaching the third parallel to have recourse to sap.

Sapping required trained men. It consisted in gradually pushing forward the end of a narrow trench in the desired direction. At the sap-head was a squad of sappers. The leading man

excavated a trench one foot six inches wide and deep. To protect the head of the trench he had a shield on wheels, under cover of which he placed the gabions in position one after another as the sap-head progressed. Other men following strengthened the parapet with fascines, and increased the trench to a depth of three feet, and a width of two feet six inches to three feet. Fig. 13, taken from Vauban's treatise on the attack, shows the process

FIG. 13.—THE PROCESS OF SAPPING IN THE 17TH CENTURY

clearly. The sap could then be widened to ordinary trench dimensions by infantry working parties.

As the work at the sap-head was very dangerous, Vauban encouraged his sappers by paying them on the spot at piecework rates, which increased rapidly in proportion to the risk. He reckoned on a rate of progress for an ordinary sap of about 50yd. in 24 hours.

The nearer the approaches drew to the covered way, the more oblique became the zigzags, so that little forward progress was made in proportion to the length of the trench. The approaches were then carried straight to the front, by means of the "double sap," which consisted of two single saps worked together with a parapet on each side. To protect these from being enfiladed from the front, traverses had to be left at intervals.

From the third parallel the attack was pushed forward up the glacis by means of the double sap. It was then pushed right and left along the glacis, a little distance from the crest of the covered way. This was called "crowning" the covered way, and on the position thus gained breaching batteries were established in full view of the escarp. While the escarp was being breached, if it was intended to use a wide systematic attack, a mine gallery (*see* "Military Mining" below) was driven under the covered way and an opening made through the counter-scarp into the ditch. The sap was then pushed across the ditch, and if necessary up to the breach, the defenders' resistance being kept under by musketry and artillery fire from the covered way. The ravelin and bastions were then captured successively.

Vauban showed how to breach the escarp with the least expenditure of ammunition. This was done by making, with successive shots placed close together (as was feasible even then at such short range) horizontal and vertical cuts through the revetment wall. The portion of revetment enclosed by the cuts being thus detached from support was overturned by the pressure of the earth from the rampart. Ricochet fire was also the invention of Vauban. He showed how, in enfilading the face of a work, by using greatly reduced charges a shot could be made to drop over the crest of the parapet and skim along the terreplein, dismounting guns and killing men as it went.

18th Century Principles of Defence.—The constant success of Vauban must be ascribed to method and thorough organization. There was a deadly certainty about his system that gave rise to the saying "Place assiégée, place prise." He left nothing to chance, and preferred as a rule the slow and certain progress of saps across the ditch and up the breach to the loss and delay that might follow an unsuccessful assault. His contemporary and nearest rival Coehoorn tried to shorten sieges by heavy artillery fire and attacks across the open; but in the long run his sieges were slower than Vauban's. The theory of defence at this time appeared to be that as it was impossible to arrest the now methodical and protected progress of the besiegers' trenches, no real resistance was possible until after they had

reached the covered way, and this idea is at the root of the extraordinary complications of outworks and multiplied lines of ramparts that characterized the "systems" of this period. No doubt if a successor to Vauban could have brought the same genius to bear on the actual defence of places as he did on the attack, he would have discovered that the essence of successful defence lay in offensive action outside the body of the place, viz., with trench against trench. Fighting was so much regulated by the laws and customs of war that men thought nothing of giving up a place if, according to accepted opinion, the enemy had advanced so far that they could no longer hope to defend it successfully. This is the real reason for the feeble resistance so often made by fortresses in the 17th and 18th centuries, which has been attributed to inherent weakness in fortifications. Custom exacted that a commandant should not give up a place until there was an open breach or, perhaps, until he had stood at least one assault. Even Napoleon recognized this limitation of the powers of defence when in the later years of his reign he was trying to impress upon his governors the importance of their charge. The limitation was unnecessary, for history at that time could have afforded plenty of instances of places that had been successfully defended for many months after breaches were opened, and assault after assault repulsed on the same breach. But the same soldiers of the 17th and 18th centuries who had created this artificial condition of affairs, established it by making it an understood thing that a garrison which surrendered without giving too much trouble after a breach had been opened should have honourable consideration; while if they put the besiegers to the pains of storming the breach, they were liable to be put to the sword.

Peninsular War.—It has been necessary to dwell at some length on the siegecraft of Vauban and his time, not merely for its historical interest, but because the system he introduced was practically unaltered until the end of the 19th century. The sieges of the Peninsular War were conducted on his lines; so was that of Antwerp in 1830; and as far as the disposition of siege trenches was concerned, the same system remained in the Crimea, the Franco-German War and the Russo-Turkish War. The sieges in the Napoleonic wars were few, except in the Iberian peninsula. These last differed from those of the Vauban period and the 18th century in this, that instead of being deliberately undertaken with ample means, against fortresses that answered to the requirements of the time, they were attempted with inadequate forces and materials, against out-of-date works. The fortresses that Wellington besieged in Spain had rudimentary outworks, and escarps that could be seen and breached from a distance. At that time, though the power of small arms had increased very slightly since the last century, there had been a distinct improvement in artillery, so that it was possible to breach a visible revetment at ranges from 500 to 1,000 yards. Wellington was very badly off for engineers, siege artillery and material. Trench works could only be carried out on a small scale and slowly. Time being usually of great importance, as in the first two sieges of Badajoz, his technical advisers endeavoured to shorten sieges by breaching the escarp from a distance—a new departure—and launching assaults from trenches that had not reached the covered way. Under these circumstances the direct attacks on breaches failed several times, with great loss of life.

Crimea.—During the long peace that followed the Napoleonic wars, one advance was made in siegecraft. In England in 1824 successful experiments were carried out in breaching an unseen wall by curved or indirect fire from howitzers. At Antwerp in 1830 the increasing power and range of artillery, and especially of howitzers, were used for bombarding purposes, the breaches there being mostly made by mines. Then came one of the world's great sieges; that of Sevastopol in 1854-55 (*see* CRIMEAN WAR). The outstanding lesson of Sevastopol is the value of an active defence; of going out to meet the besieger, with counter-trench and counter-mine. This lesson increased in value in proportion to the increased power of the rifle.

In comparing the resistance made behind the earthworks of Sevastopol with the recorded defences of permanent works, it is

essential to remember that the conditions there were abnormal.

The siege corps was not sufficiently strong to invest the fortress completely, in fact the Russians came nearer to investing the Allies; the Russians had the preponderance in guns almost throughout; the Russian force in and about Sevastopol was numerically superior to that of the Allies. We must add to this that Todleben had been able to get rid of most of his civilian population, and those who remained were chiefly dockyard workmen, able to give most valuable assistance on the defence works. The circumstances were therefore exceptionally favourable to an active defence. The weak point about the extemporized earthworks, which eventually led to the fall of the place, was the want of good bomb-proof cover near the parapets.

Franco-German War.—The Franco-German War of 1870 produced no great novelty. The Germans were not anxious to undertake siege operations when it could be avoided. In several cases minor fortresses surrendered after a slight bombardment. In others, after the bombardment failed, the Germans contented themselves with establishing a blockade or detaching a small observing force. By far the most interesting siege was that of Belfort (*q.v.*). Here Col. Denfert-Rochereau employed the active defence so successfully by extemporizing detached redoubts and fortifying outlying villages, that he obliged the besiegers (who, however, were a small force at first) to take up an investing line 25m. long; and succeeded in holding the village of Danjoutin, 2,000yd. in advance of the enceinte, for two months after the siege began. He also used indirect fire, withdrawing guns from the ramparts and placing them in the ditches, in the open spaces of the town, etc. At Paris the French found great advantage in placing batteries in inconspicuous positions outside the forts. The guns in the Paris forts, which were handicapped by being fired through embrasures with conspicuous parapets and the bad shooting of the gunners, were easily silenced. At Strasbourg indirect fire against escarps was used. The escarp of Lunette 53 was successfully breached by this method; 1,000 rounds from 60-pounder guns sufficed to make a breach 30yd. wide.

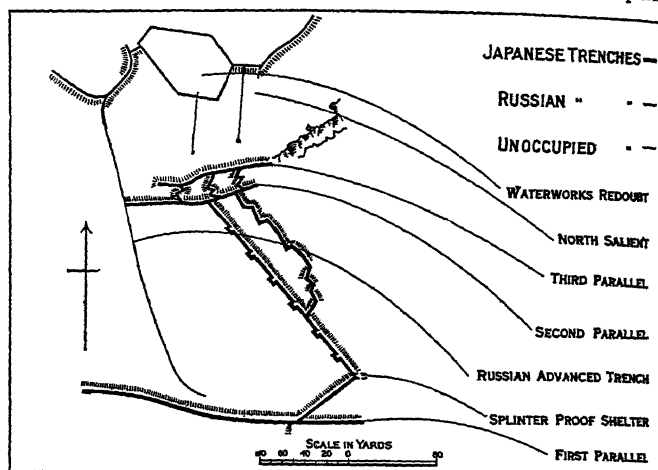

MODERN SIEGE WARFARE

The sieges of Belfort in 1871 and of Plevna in 1877 had shown the great strength of extemporized field works and the value of an active defence, but regular siege methods had altered little since the days of Vauban. In 1880, however, the invention of high explosive shell introduced an important factor into the methods of attack. By the close of the 19th century the range of guns, and the power of their projectiles, had so increased that it was thought that by a heavy bombardment resistance would be paralysed, and the way made open for an attack delivered by great numbers and provided with special appliances for crossing obstacles. Imbued with these ideas, the Japanese in 1904 assaulted Port Arthur. In spite of the fire of the new 11in. siege howitzers, which were used in the second and third attacks, all three assaults failed. It was found impossible to rush even semi-permanent works, or well prepared field defences, and a return had to be made to the old forms of methodical attack by means of parallels and saps and mines.

Sapping.—Provided the primary condition of a sap, that is advancing the trench towards the enemy without being enfiladed, is fulfilled, a sap may take any form. There are various methods of approach. A blinded or "Russian" sap may also be used. In this case the sap consists of a tunnel with about two feet of earth left above it, or it is covered over with timber and earth. Saps of this description were used by the British in the opening stages of the Battle of the Somme on July 1, 1916, and were subsequently opened up to form communication trenches to the German lines. As the digging of deep saps from the sap head is a very slow form of progression, whenever possible men are sent out under cover of darkness to build in prolongation of the sap a short length of parapet of sandbags or steel shields under cover of which a length of trench can be excavated.

A typical example of the methods of approach by sap and the formation of parallels is shown in fig. 14 which illustrates the Japanese attack on the waterworks redoubt of Port Arthur. The

first parallel was formed about 300yd. from the redoubt by extending a portion of an advanced Russian trench to the right and left. Taking advantage of the ground, the first sap was commenced right handed for 65yd. A left turn was then made to bring the sap just clear of the left of the redoubt. This portion was traversed to prevent the sap from being enfiladed from a Russian trench to the east. About 100yd. from the redoubt, a second paral-

FIG. 14.—PLAN OF JAPANESE SAPS AGAINST THE WATERWORKS REDOUBT OF PORT ARTHUR

lel was formed, and, from here, three zigzag saps were driven forward, their heads being joined to form the third parallel within assaulting distance of the redoubt.

Passage of Obstacles and Siege Appliances.—Where wire obstacles still remained between the last parallel and the defenders' position, their passage presented considerable difficulties. Efforts were made at night to roll forward V-shaped steel shields, under cover of which men could use wire cutters to clear a path. This method was very slow and hazardous, and, later, charges of high explosive were pushed under the wire and detonated to blast a lane through the obstacle. To enable men to assault across entanglements which could not be cleared, planks, ladders, mattresses, etc., were carried forward and thrown over the wire to form a means of crossing. The close and hand-to-hand fighting that resulted from this step by step method of approach, revived the use of hand grenades and trench mortars. The Japanese hand grenades usually consisted of metal cylinders eight to ten in. long and one and

FIG. 15.—PORT ARTHUR: 203 METRE HILL, JAPANESE OBLIQUE APPROACH TRENCH

a half inches in diameter, filled with high explosive and fired by means of a short length of safety fuse. The mortars were of wood bound with wire, five inches in internal diameter, and firing a 4½ lb. canister of high explosive to a maximum distance of 400 yards. Seven-inch mortars were also used which fired a 14½ lb. canister up to 150 yards.

World War.—Except in a very few instances, little attention appears to have been paid by military opinion to the lessons of the siege of Port Arthur. It was generally thought that modern European wars would be short and sharp and that no protracted siege operations would take place. The rapid fall of the fortresses of Liège and Namur confirmed these opinions, and the essential siege nature of the trench warfare of 1914–15 was neither foreseen nor, at first, realized. No preparation had been made for extensive siege work, and siege stores were entirely lacking. Timber for the revetment of saps and trenches, barbed wire and posts for their local protection, mining stores, light railway material, etc., were inadequate. Hand grenades had to be made out of jam tins, and wood and wire bound trench mortars were again improvised. The

number of technical troops was soon found to be insufficient. In the British divisions the engineer companies were increased from two to three and a pioneer battalion added. Numerous special engineer units such as mining companies were also formed. But it was the lack of ammunition and heavy artillery, for counter battery work and the destruction of hostile works and defences, that was most severely felt. As this was gradually remedied the weight of heavy artillery fire, aided by air photography and directed by air observation and sound location, greatly increased the power of the attacker to destroy the defender's works and guns. But the problem of destroying and crossing wire entanglements defended by machine guns remained unsolved. The introduction of various forms of efficient trench mortar, and the "106" or instantaneous fuse, enabled wire that could be seen to be destroyed, but in extended areas and where hidden from direct observation, wire and M.G.'s formed the chief obstacles. Smoke was found a useful adjunct for blinding machine guns, and "Bangalore torpedoes," or long tubes of explosives, thrust under the wire entanglements and detonated, were used to form lanes through the obstacles. Great progress was also made in mining methods and the efficiency of close combat weapons improved. Hand grenades and trench mortars were standardized and manufactured in large quantities. Stokes mortars, handy and portable, which enabled a rapid rate of fire to be turned, from a short distance, on to a work, were invented, and a new and deadly, though in the long run not a very efficient, close range weapon, the flame thrower, which could throw a flaming jet 80 to 100 yd., was introduced.

But up to 1917 artillery remained the chief weapon of the besiegers' armoury. The thoroughly prepared attack on the very strong Messines Ridge position in June 1917 may be said to be the culminating act of the regular siege operations. In addition to the 20 mines containing a million pounds of explosives which were detonated under the German lines, three and a half million rounds of artillery ammunition were fired during the ten days' bombardment prior to the assault. The increase in depth of defensive positions, the dispersion of machine guns in concrete pill-boxes, and the introduction of tanks, put an end to siege warfare methods of attack. The conduct of a siege places a very heavy strain on the administration and transportation services. To enable men to live, without undue casualties from sickness, in the forward trenches, careful and detailed arrangements have to be made. The provision of hot food, warm clothing, drying rooms, rest billets, baths and laundries behind the lines, the extension and improvement of communications to carry the vast quantities of ammunition and engineer stores of every kind, requires an elaborate organization; and without this organization the pressure required for a modern siege cannot be maintained. As an example of the weights that have to be dealt with, one British army in the assault of the Hindenburg Line in Sept. 1918 expended 12,500 tons of ammunition in one day.

(E. H. K.)

MILITARY MINING

Mining is one of the oldest forms of siege warfare. The blowing of the trumpets and circumambulation were probably done to cover the final mining of the walls of Jericho. But it was not until 1487 that gunpowder was used. When Shakespeare makes Fluellen say at Henry V.'s siege of Harfleur "th' adversary is dight himself four yards under the counter-mines; I think 'a will plow up all . . ." he is anticipating that development of siegecraft by nearly 100 years.

When the attacker, owing to casualty fears, does not care to advance above ground by means of saps and trenches he may resort to underground galleries. Large charges exploded in these galleries either destroy the works attacked, or they can be made to form a

FIG. 16.—DIAGRAM SHOWING MINE SYSTEM IN ATTACK AND DEFENSE

series of craters, which, occupied by infantry and joined together by trenches, form a new parallel. For this offensive mining, geological conditions must be favourable, and surprise and speed are essential. Successful mine attacks, therefore, cannot be made in water-logged strata nor in hard rock. As a defence against this form of attack countermines are used. In olden days the object was to break into the attacker's galleries and capture them by hand-to-hand fighting. Now, charges sufficient to destroy them are exploded near by. In order to locate the advancing galleries listening is of the first importance.

A protective system therefore consists of a series of listening galleries, usually of the herring-bone type, spaced so that the enemy are unable to drive a gallery between them without being heard. The distance apart depends on the range of hearing in the soil. In average chalk the naked ear can detect "picking" at a distance of 150 ft., but in clay only up to 50 ft. The attacker having been heard, it is necessary either to destroy his galleries or to make him blow a mine prematurely. To do this the defender prolongs his listening galleries in the direction of the attack and at a suitable distance fires a charge. But in order not to form a crater, which would afford cover to the attacking infantry, the charge is so calculated that the explosion while destroying the enemy's gallery, will not break the surface of the ground. This is known as a "camouflet." (See fig. 16.)

The action of a mine may be great enough to break the surface of the ground. The effect is greatest along O.A. the Line of Least Resistance (L.L.R.). The radius of the crater formed is A.B. The ratio $\frac{A.B.}{O.A.}$ or $\frac{\text{Radius of crater}}{\text{L.L.R.}}$ is the index of the mine.

A mine of index 1 is known as a "common mine." (Fig. 17.) Those of larger index "overcharged" and those of smaller index "undercharged mines." Craters are also known as one-lined, two-lined, three-lined, etc., according to whether their diameter is equal or twice or three times the L.L.R. Thus a common mine forms a two-lined crater. The charge required to form a crater of given radius depends on the nature of the soil, the explosive and depth it is laid: where D = the depth of the charge in feet, N = the index of the mine $\frac{(\text{Radius of crater})}{\text{L. L. R.}}$ S = soil factor, E = explosive factor. The charge in lbs. = $\frac{S \times D}{10 \times E} (\sqrt{1 + N^2 - 0.41})^3$.

FIG. 17.—DIAGRAM SHOWING THE ACTION OF A COMMON MINE

factor. The charge in lbs. = $\frac{S \times D}{10 \times E} (\sqrt{1 + N^2 - 0.41})^3$.

Construction.—Mine galleries are started from the bottom of vertical shafts or inclines, and to prevent collapse of the earth they are lined with timber or iron sheeting. Owing to the volume of the soil excavated and to the difficulty of carrying and concealing it, the galleries are of small dimensions: 4 ft. 10 in. by 2 ft. 9 in. is a normal size, while 4 ft. 3 in. by 2 ft. 3 in. is the minimum convenient section. Alignment and direction are maintained with the help of the miner's dial, and levels with the Dumpy level.

The method of excavation has altered very little since ancient times. The smallness of the galleries and the necessity for silence makes the employment of machinery difficult; although various types have been tried, the results have been disappointing, and reliance is still placed on the miner with pick, shovel and grafting tool. In clay or sand, "kicking" is a rapid and silent means of progress. The miner, lying with his back supported by a board fixed across the gallery, pushes his grafting tool (or push pick) horizontally into the soil. The rate of advance varies with the soil and the facilities for removing the excavated soil. 15 ft. in 24 hours is an average rate, while 30 ft. has been reached in blue clay. Ventilation is important. When two entrances can be provided to a gallery, a current of air will always flow along it, but for mine heads forced ventilation by mechanical air-pumps and fans is necessary. Lighting is now provided by electricity and portable electric torches.

Loading and Firing.—Of the various high explosives used, ammonal—which is three times more powerful than black powder

—has been found the most satisfactory. The charge having been packed in the mine chamber, the whole gallery is tamped with sandbags well bonded together for a distance equal to one and a half times the radius of rupture. The tamping is improved by making two right angle bends in the gallery leading to the chamber, or air spaces may be left between lengths of tamping. The charge is fired by electricity with electric detonators, using alternative circuits in case of failure, or a slow and instantaneous fuse (Cordeau Detonant) may be used.

Rescue and Listening Apparatus.—The presence of mine gas and carbon monoxide, which is colourless and odourless, necessitates special precautions. Canaries and mice, being more easily affected than man, are used to give warning of poisonous gases. For rescue work in a contaminated mine, Proto and Salvus self-contained breathing sets with portable oxygen cylinders are used, and mine stretchers of matting enable a man to be dragged along a gallery. Listening is of such vital importance that every effort is made to aid the human ear. When immersed in a basin of water placed on the ground, the ear can detect sound otherwise unheard. Of modern listening apparatus two types are used—the geophone, which works on the principle of the stethoscope and the seismophone, which is an electrical detector. With two geophones the direction of the source of sound can be obtained, while with seismophones (which do not give direction) placed in various galleries and connected to the switchboard of a central listening chamber, one operator can listen over a wide front.

Examples of Mining.—At Frederick the Great's siege of Schweidnitz in 1762 (mentioned in Carlyle's *Frederick the Great*) a mine of 5,400 lbs., 16ft. below the surface, made a crater 42ft. in radius. Mining was extensively employed during the Crimean war. At the siege of Sevastopol, over five miles of galleries were driven by the opposing armies, and the French alone used over 130,000 lbs. of powder. In the American Civil War an interesting mine was fired by the Federals in June 1864 at the siege of Petersburg. The circumstances were all abnormal. No military mines, mining tools or materials were available; and no one had any confidence in its success, except its originator, Lt.-Col. Pleasants, his regiment, which was recruited from a mining area, and Gen. Burnside, the corps commander. The opposing entrenchments were 130 yd. apart. The mine gallery was started behind the Federal lines and driven a distance of 170yd. until it came under a redoubt in the Confederate lines. There two branches were made right and left, each about 38ft. long, and in them eight mines aggregating 8,000 lb. of powder were placed. The first attempt to fire them failed, and an officer and a sergeant volunteered to enter the gallery to seek the cause of failure. A defective splice in two lengths of fuse was thus discovered and repaired. At the second attempt all the mines were successfully fired simultaneously and a crater 170ft. long by 60ft. wide and 30ft. deep was formed. Several hundred men in the redoubt were blown up and mostly killed; but the assault which followed failed completely from want of organization. Modern high explosives were first used during the Russo-Japanese War, where at the siege of Port Arthur in 1905 underground operations played an important part, and mines were used for the attack and defence of trenches.

World War.—At the commencement of the World War in 1914, the power of the heavy howitzers, which had so rapidly destroyed the Belgian forts, appeared to indicate that for the reduction of fortresses, mining would be unnecessary. It soon, however, became evident that with the advent of position warfare, and the difficulty of making any advance above ground in the face of machine guns and barbed wire, the attack of important localities by mining would be advantageous. Further, the opposing lines approached each other so closely that a bombardment of the hostile front trenches could not be carried out by either side without damage to their own. Mining was therefore resorted to increasingly. Mines were effectively used in the opening stages of the battle of the Somme in 1916, and some brilliant mine attacks were carried out by the French. It was, however, during the attack on the Messines Ridge in 1917 that mining reached its greatest achievement. At 3:10 A.M. on June 7, on a front of nine miles, and within an interval of 30secs. 20 mines containing 1,000,000 lbs. of

explosives, were detonated. The largest of them (at St. Eloi) was 125ft. deep, took months to complete and contained 43 tons of ammonal, while the earth shake was clearly felt at Cassel 16m. away. The use of these great mines, the destructive effects of which could not be definitely foretold, was a matter of anxiety, but they were certainly successful. Ludendorff writes in his memoirs: "We should have succeeded in retaining the position but for the exceptionally powerful mines used by the British which paved the way for the attack. . . . The moral effect of these explosions was simply staggering."

With the introduction of tanks, offensive and consequently defensive mining declined. It was seldom found to be worth the time, labour and materials expended and was only used as a last resort. Exceptional circumstances will, however, arise when, for the possession of important and stubbornly contested localities, mining will again be used, and for underground protection against the increasing bombardment of artillery and bombing aircraft, subways and mined dugouts will be extensively required.

(E. H. K.)

FIELD FORTIFICATION

Field Fortifications, now more often spoken of as field defences, are those which are constructed at short notice, with the means locally available, usually when the enemy is near at hand. Subject to the question of time, a very high degree of strength can be given to them if the military situation makes it worth while to expend sufficient labour. A century or more ago, the dividing line between permanent and field fortification was rigidly drawn, as a high masonry escarp surmounted by a rampart was essential to a permanent fortress and these could naturally not be extemporized. Works without masonry, in other ways made as strong as possible with deep ditches and heavy timbers, were known as *semi-permanent*, and were used for the defence of places which acquired strategic importance in the course of a war, but were not immediately threatened. The term *field* fortification was reserved for works constructed of lighter materials, with parapets and ditches of only moderate development. In modern fortification, if cupolas and deep revetted ditches were essential to permanent defences, the dividing line would be equally clear. But actually the use of our present means of construction, in conjunction with the defensive power of modern fire-arms, makes it possible to extemporize in a very short time works having much of the resisting power of a permanent fortress. Further, such works can be expanded from the smallest beginnings; and, if the site is not too exposed, in the presence of the enemy.

Field fortification offers, as regards the actual constructions, a limited scope to the engineer; and a little consideration will show that its defensive possibilities were not greatly affected by the change from machine-thrown projectiles to those fired by rude

FIG. 18.—DIAGRAM SHOWING CONSTRUCTION OF MINED DUG-OUTS

smooth-bore guns. There is therefore nothing in the history of this branch of the subject that is worth tracing, from the earliest ages to about the end of the 18th century. One or two points may be noticed. The use of obstacles is probably one of the earliest measures of defence. Long before missile weapons had acquired such an importance as to make it worth while to seek shelter from them it would obviously have been found desirable to have some means of checking the onrush of an enemy physically or numerically superior. Hence the use by savage tribes, to this day, of pits, pointed stakes hidden in the grass, entanglements and similar ob-

stacles. In this direction the ages have made no change, and the most highly civilized nations still use the same obstacles on occasion.

Another use of field defences common to all ages is the protection of camps at night, where small forces are operating against an enemy more numerous but inferior in arms and discipline. In daylight such an enemy is not feared, but at night his numbers might be dangerous. Hence the Roman practice of making each foot-soldier carry a couple of stakes for palisades; and the simple defence of a thorn zariba used by the British for their camps in the Sudan. Palisades and trenches, abatis and sharpened stakes have always been used. Except wire, there is practically no new material. As to methods, the laagers of the Boers are preceded by the wagon-forts of the Hussites, and those no doubt by similar arrangements of British or Assyrian war chariots; and so in almost every direction it will be found that the expedient of to-day has had its forerunners in those of the countless yesterdays. The only really marked change in the arrangements of field defences has been caused not by gunpowder but by quick-firing rifled weapons. For that reason it is worth while to consider briefly what were the principles of field fortification at the end of the 18th century. The field defences of the 19th century are transitional in character. Based mainly on the old methods, they show only faint attempts at adaptation to new conditions, and it was not till quite the end of the century that the methods now accepted began to take shape. The essential elements of fieldworks up to the time of the Peninsular War were *command* and *obstacle*; now they are *protection* and *concealment*.

Old Type of Field Defences.—The command and obstacle were as necessary in the days of smooth-bore muskets and guns as in those of javelins and arrows. When the enemy could get close up to a work without serious loss, and attack in close order, the defenders needed a really good obstacle in front of them. Moreover, as they could not rely on their fire alone to repulse the attack, they needed a two-deep line, with reserves close at hand, to meet it with the "arme blanche." For this purpose a parapet seven or eight feet high, with a steep slope, perhaps palisaded, up which the attackers must climb after passing the obstacle, was excellent. The defenders after firing their last volley could use their bayonets from the top of the parapet with the advantage of position. The high parapet had also the advantage that the attackers could not tell what was going on inside the redoubt, and the defenders were sheltered from their fire as well as from view until the last moment.

The strength of a fortified line in the 18th century depended principally on its redoubts. Lines of shelter trenches had little power of defence at the time, unless they held practically as many men as would have sufficed to fight in the open. Obstacles on the other hand had a greater value against the inelastic tactics of the time than they have now. A good position therefore was one which offered good fire-positions for redoubts and plenty of facilities for creating obstacles. Strong redoubts which could resist determined assaults; good obstacles in the intervals, guns in the redoubts to sweep the intervals, and troops in formed bodies kept in reserve for counter-strokes—these were the essentials in the days of the smooth-bore.

Torres Vedras.—On irregular ground the first necessity was to fit the redoubt to the ground on which it stood, so as to sweep the whole of the foreground, and this was generally a sufficiently difficult matter without adding the complications of flanking defences.

Sir John Jones, speaking of the traces of the several works in the Torres Vedras lines, says:

"The redoubts (fig. 19) were made of every capacity, from those limited by want of space on the ground and occupied by 50 men and two pieces of artillery, to those for 500 men and some six pieces of artillery, the importance of the object to be attained being the only guide in forming the dimensions. The profile of the several works varied on every face and flank, according to its liability to be attacked or cannonaded; the only general rule enforced

being that all ditches should be at least 15ft. wide at top and 10ft. in depth, and the crest of the parapet have at least 5ft. command over the crest of the counterscarp. No parapet exceeded 10ft. in thickness, unless exposed to be severely cannonaded, and few more than 6 or 8ft.; and some on high knolls, where artillery could not by any possibility be brought against them, were made of stone

FIG. 20.—SECTION THROUGH THE TORRES VEDRAS WORKS

or rubble less than 2ft. in thickness, to gain more interior space, and allow full liberty for the use of the defenders' bayonets."

Fig. 20 gives two typical sections of these works.

The works of Torres Vedras have been chosen for illustration because they offer very good historical examples, and also because of the value of the critical remarks of Sir John Jones, who as a captain was the engineer in charge of their construction. At the same time, it must be remembered that they differ from ordinary fieldworks in having an unusual degree of strength, plenty of time and civilian labour having been available for their construction. In this respect they approximate more to semi-permanent works, the main reason why they did not receive under the circumstances a greater development of ditch and parapet being that in addition to the large number of works required, much labour was expended in abatis, inundations, scarping hill-sides and constructing roads.

The keynote of the period was thus that the redoubts were the most important features of lines of defence, and that they combined physical obstacle and protection with good musketry and artillery positions. The value of concealment was not ignored, but it was as a rule subordinated to other considerations.

19th Century.—The basic methods remained unaltered until after the Crimean War. In the American Civil War the power of the rifle began to assert itself, and gave greatly enhanced importance to any defences that could be hastily extemporized behind walls, hedges or any natural cover. Plevna in 1877 taught a further lesson. It proved the great resisting power of extemporized lines; but more than that, we begin to find new arrangements for protection against shell fire (see plans and sections in Green's *The Russian Army and its Campaign in Turkey*). The trace of the works and the sections of parapet and ditch suggest Torres Vedras; but a multiplication of interior traverses and splinter-proof shelters shows the necessity for a different class of protection. The parapet was designed according to the old type for want of a better; the traverses and shelters were added later, to meet the necessities of the case.

From 1877 to 1899 the efficiency of rifles and guns rapidly increased, and radically affected the nature of protection required and instilled the lesson of the adaptation of works to ground. In the Boer War, and still more in the Russo-Japanese War, field defences not only exerted an increasingly important influence, but were themselves developed and modified until in the World War the technique of field fortification reached its height and assumed its present form. Modifications since 1918 have been in the direction of simplicity of design and elasticity of organization. (X.)

PRINCIPLES OF MODERN FIELD DEFENCES

While the basic principle of hitting the enemy without being hit oneself remains unchanged, the increased efficiency of artillery and small arms and the introduction of tanks have considerably

FIG. 19.—TORRES VEDRAS WORKS. AN EXAMPLE OF 19TH CENTURY FIELD DEFENCES

affected the design of field fortification. In early times command and an unclimbable obstacle were necessary; now observation, concealment and tank obstacles are required. The defender by skilful use of the ground, reinforced by the artificial aid of field works, can hold out against a greatly superior enemy, but protection is required against tanks, rifle and machine gun fire. Also, when time is available, against heavy high explosive shell, air

FIG. 21.—PLAN OF DEFENDED LOCALITY FOR ONE PLATOON

bombs and gas. Field fortification varies from "hasty" defences made on the battlefield to "deliberate" work on rear defences. Machine guns, anti-tank guns and artillery form the framework of a defensive position. To use them to the best advantage, good observation is necessary, and as field defences seldom have sufficient strength to protect them against heavy shells, concealment is essential. A continuous trench held throughout its length is a weak line lacking in strength and depth. Important tactical localities, supporting one another and flanked by the fire of machine guns and artillery, are therefore held by complete infantry units. These "defended localities" are sited where possible to be proof against tank attack. They are organized as a system of "defended posts" consisting of short lengths of fire trench, dispersed in the best fire positions, and each capable of holding a section of infantry (seven men) see fig. 21. In order to prevent these defended posts and localities from being easily recognized on aeroplane photographs, to provide inter-communication, and to afford the intermediate fire positions required in fog or darkness, they are later connected by trenches.

Fire Trenches.—Fig. 22 shows the normal section of a fire trench. The thickness of the parapet is sufficient to stop rifle and machine-gun bullets, as well as shrapnel and shell splinters, but no attempt is made, as in the old days, to make it proof against shell fire. To localize the effect of high explosive shells, *traverses* 15 ft. wide are left every 30 ft. and a low parapet of earth, known as the *parados*, is thrown up behind the trench. To give increased

FIG. 22.—SECTION OF A FIRE TRENCH

protection from shell fire and to facilitate concealment, deep narrow trenches were introduced. These were satisfactorily used in the Boer War for temporary occupation in very firm soil. They were also tried in the beginning of the war of 1914-18, but it was soon found that for inter-communication and to prevent the fire trench from being entirely closed up by shells falling near it, wider trenches were necessary. However, short lengths of narrow trench, called shell slits, were found useful for cover during a sudden bombardment. Prior to 1914 loopholes and overhead cover were provided, but under modern shell fire these were rapidly destroyed, and the debris hindered men from firing over the parapet. Small and very carefully concealed loopholes for snipers and

look out posts were therefore the only ones used.

Revetment and Drainage.—Under the action of the weather, in normal soil the sides of the trench will not stand at a steep slope. The trench must therefore either be widened at the top, at the expense of protection, and the slope lessened, or a revetment wall provided. This consists of brushwood hurdles, corrugated iron, expanded metal, canvas and wire netting, sandbags, etc. Corrugated iron when damaged by shell fire is difficult to dig out and replace, while canvas, whether in panels or sandbags, soon

FIG. 23.—TRENCH WITH WOODEN REVETTING SPACED 3 FT. APART

rots. The labour entailed in building the initial revetment and in its upkeep is so great that it is used as little as possible. The section of the Hindenburg line (fig. 24) is a good example of a trench with gentle slopes and revetted only at the fire step. To enable trenches to be occupied in wet weather, and to prevent their collapse, good drainage is essential. Fig. 23 shows a trench with wooden revetting or "A" frames spaced three feet apart. Trench boards are laid on the upper cross pieces and the bottom of the trench forms a drain. Where the water level is close to the surface of the ground breastworks are used in place of trenches. The time required to dig trenches naturally varies with the soil and distance marched, but 60 cu. ft. in a four hour task may be considered as an average rate per man. Investigations have been made at Chatham on the lines of the Industrial Fatigue Research Board to facilitate digging, and a simple drill formulated. By attending to rhythm, and working the shovel at the rate of 18 swings, alternatively with the pick at the rate of 28 strokes per

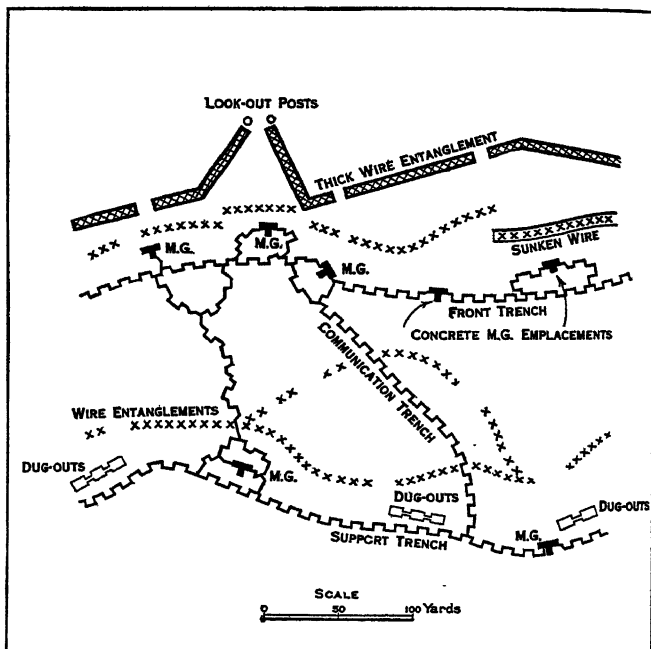

FIG. 24.—DIAGRAM OF A TYPICAL SECTOR OF THE HINDENBURG LINE

minute, with rest pauses of two minutes in every ten, output is increased and fatigue lessened.

Siting of Fire Trenches.—In order to secure the observation so essential for artillery, anti-tank and machine-gun fire, infantry trenches are sited in advance of the observation posts. Provided that artillery and machine-gun support can be arranged, the field of fire in front of these trenches need not be more than 150 yd.; but where hasty or temporary positions are occupied, as for outposts or rear guards, 500 yd. is advisable. Enfilade or flanking fire

is most effective. A fire trench should be so designed and sited that the occupants, while being able to use their weapons to the best advantage, are protected from the enemy's fire and tank attack. Concealment and anti-tank defence are, therefore, of great importance. In undulating or hilly country, trenches sited near the crest line have often a long field of view and fire, but they are conspicuous and are usually close to the observation post

FIG. 25.—APRON FENCE OF BARBED WIRE ERECTED AS A PROTECTIVE OBSTACLE FOR FIRE POSITIONS AGAINST INFANTRY

which it is one of their duties to protect. A position down the forward slope is therefore often better. When the attacker is greatly superior in artillery, and surprise can be attained, a position on the reverse or rearward slope, with artillery observation and machine gun fire from a ridge in rear, has considerable advantages. The Hindenburg line dug by the Germans in 1916-17 between Arras and St. Quentin, is an interesting example of the siting of defences. The position was primarily chosen to secure good observation and cover for the defenders, while denying artillery positions and observation to the attack. The front line, of irregular trace to obtain full value from flanking fire, was sited where possible down the forward slope, while the support line was in rear of the crest. The position was protected by wide belts of wire, and defended by a series of ferro-concrete machine-gun emplacements 80 to 150 yd. apart sited to flank the wire obstacle.

Obstacles.—In order to delay the enemy under the fire of the defenders and to shepherd him into areas where he can be easily dealt with, protective and tactical obstacles are erected. Protective obstacles for the immediate protection of the fire positions, are placed 30 to 100 yd. from the trenches—close enough to prevent the enemy cutting them by night and far enough to prevent bombing by hand grenades. Tactical obstacles in large irregular blocks are sited in conjunction with the artillery and machine-gun fire. Against infantry, wire entanglements are generally used. Fig. 25 shows an apron fence of barbed wire which can be erected by ten men at the rate of 100 yd. an hour. Abatis made by cutting down trees or bushes three feet from the ground and inter-

FIG. 26.—TANK MINE, IMPROVISED WITH SHELLS CONCEALED UNDER A WIRE OBSTACLE

lacing the branches with wire make good obstacles, but unless in hollows are apt to restrict the view of the defenders. Inundations are of great value.

Against tanks, since artificial obstacles take considerable time and labour to erect, the greatest use is made of existing ones such as woods, marshes, waterways, steep banks, cuttings, etc. In restricted approaches, such as the entrances to villages, vertical steel girders set in concrete blocks, or "elephant pits" 8 ft. deep and 10 ft. wide, lightly covered with timber and earth, are effective. For longer fronts a V-shaped ditch with a five foot vertical

revetted face nearest the defenders will stop tanks until battered by artillery. Tank mines, however, form the best obstacles. These consist of light portable mines laid just below the surface of the ground, or may be improvised with shells with percussion fuses as shown in fig. 26.

Protection from Shell Fire and Gas.—While two feet of earth is sufficient to stop shrapnel or shell splinters, mined dugouts or ferro-concrete shelters are required for protection against heavy shell and aerial bombs. To be proof against the most dangerous shells mined dugouts must be soft, deep, but against 6 in. shells

FIG. 27.—MACHINE GUN EMPLACEMENT IN THE OPEN

30 ft. of clay or 25 ft. of chalk is sufficient. For ferro-concrete shelters a thickness of four feet is proof against 6 in. shell and six feet will withstand 15 in. For protection against gas, dugouts, concrete shelters and cellars can be provided with doors of gas proof material, or air pumps with filters installed, which will supply pure air at a higher pressure than that outside and so prevent the entry of the gas. For observation posts existing features are generally used—a platform in a tree, behind a hedge or in a house. For machine gun emplacements, since concealment is essential, positions blending with existing features would as far as possible be used. Fig. 27 shows a machine gun emplacement in the open. This would normally be hidden by camouflage netting. Camouflage is used to conceal important spots from air observation and photography. Trenches unless in woods cannot be hidden from the air, but observation posts, machine gun emplacements, gun positions, and headquarters, when camouflaged before occupation,

FIG. 28.—DIAGRAM OF A BLOCKHOUSE, SOUTH AFRICA, 1900-1902

and the tracks to them carefully regulated, are difficult to observe. For the defence of small posts, blockhouses are frequently used. These vary from the log stockades of the Red Indian wars, stone sangars for hill pickets on the north-west frontier of India, corrugated iron and shingle blockhouses (see fig. 28) in South Africa, to the concrete "pill-box" of 1916-18. With the advent of mechanized forces, these will again be used to contain an anti-tank gun for the protection of areas liable to attack by armoured fighting vehicles. (E. H. K.)

THE HUMAN ELEMENT

In tracing the history of the science of fortification and in outlining the practice of our own time it has been necessary to dwell chiefly on the material means of defence and attack. The human element has had to be almost ignored. But here comes in the paradox, that the material means are after all the least important element of defence, for the best defences recorded in history owed little to the builder's art. The splendid defence in 1667 of Candia, whose enceinte, of early Italian design, was already obsolete, but whose capture cost the Turks 100,000 men; the three years' defence of Ostend in 1601; the holding of Arcot by Clive, are instances that present themselves to the memory at once. The very weight of the odds against them sometimes calls out the

best qualities of the defenders; and the *man* when at his best is worth many times more than the *rampart* behind which he fights. But it would be a poor dependence deliberately to make a place weak in order to evoke these qualities. One cannot be sure that the garrison will rise to the occasion, and the weakness of the place has very often been found an excuse for giving it up with little or no resistance. Very much depends on the governor. Hence the French saying, "tant vaut l'homme, tant vaut la place." Among modern men we think of Todleben (not governor, but the soul of the defence) at Sevastopol, Fenwick Williams at Kars, Denfert-Rochereau at Belfort and Osman Pasha at Plevna. The sieges of the 16th and 17th centuries offer many instances in which the event turned absolutely on the personal qualities of the governor; in some cases distinguished by courage, skill and foresight, in others by incapacity, cowardice or treachery. The reader is referred to Carnot's *Défense des places fortes* for a most interesting summary of such cases, one or two of which are quoted below.

In 1645 the young governor of the royal post at Bletchingdon House was entertaining a party of ladies from Oxford, when Cromwell appeared and summoned him to surrender. The attacking force had no firearm more powerful than a carbine, but the governor, overawed by Cromwell's personality, yielded. Charles I., who was usually merciful to his officers, caused this governor to be shot. A defence of another kind was that of Quilleboeuf in 1592. Henry IV. had occupied it and ordered it to be fortified. Before the works had been well begun, Mayenne sent 5,000 men to retake it. Bellegarde undertook its defence, with 115 soldiers, 45 gentlemen and a few inhabitants. He had ammunition but not much provisions. With these forces and a line of defence a league in length, he sustained a siege, beat off an assault on the 17th day and was relieved immediately afterwards. The relieving forces were astonished to find that he had been defending not a fortified town but a village, with a ditch which, in the places where it had begun, measured no more than four feet wide and deep.

Sometimes the ardour of defence inspired the whole body of the inhabitants. Fine examples of this are the defences of Rochelle (1627) and Saint-Jean de Lône (1636), but these are too long to quote. We may, however, mention Livron, which is curious. In 1574 Henry III. sent one of his favourites, Saint Lary Bellegarde, against the Huguenots in the Dauphiné. Being entrusted with a good army, this gentleman hoped to achieve some distinction. He began by attacking the little town of Livron, which had no garrison and was defended only by the inhabitants. But he was repulsed in three assaults, and the women of the town conceived such a contempt for him that they came in crowds to empty their slops at the breach by way of insult. This annoyed him very much, and he ordered a fresh assault. The women alone sustained this one, repulsed it lightheartedly, and the siege was raised.

Arcot.—The history of siege warfare has more in it of human interest than any other branch of military history. It is full of the personal element, of the nobility of human endurance and of dramatic surprises. And more than any battles in the open field, it shows the great results of the courage of men fighting at bay. Think of Clive at Arcot. With four officers, 120 Europeans and 200 sepoys, with two 18-pounders and eight lighter guns, he held the fort against 150 Europeans and some 10,000 native troops. "The fort" (says Orme) "seemed little capable of sustaining the impending siege. Its extent was more than a mile in circumference. The walls were in many places ruinous; the rampart too narrow to admit the firing of artillery; the parapet low and slightly built; several of the towers were decayed, and none of them capable of receiving more than one piece of cannon; the ditch was in most places fordable, in others dry and in some choked up," etc. These feeble ramparts were commanded almost everywhere by the enemy's musketry from the houses of the city outside the fort, so that the defenders were hardly able to show themselves without being hit, and much loss was suffered in this way. Yet with his tiny garrison, which numbered about one man for every seven yards of the enclosure, Clive sustained a siege of 50 days, ending with a really severe assault on two large open breaches, which was repulsed, and after which the enemy hastily decamped.

Clive's defence of the breaches, which by all the then accepted rules of war were untenable, brings us to another point which has been already mentioned, namely, that a garrison might honourably make terms when there was an open breach in their main line of defence. This is a question upon which Carnot delivers himself very strongly in endeavouring to impress upon French officers the necessity of defence to the last moment. Speaking of Cormontaigne's imaginary *Journal of the Attack of a Fortress* (which is carried up to the 35th day, and finishes by the words "It is now time to surrender"), he says with great scorn: "Crillon would have cried, 'It is time to begin fighting.' He would have said as at the siege of Quilleboeuf, 'Crillon is within, the enemy is without.' Thus when Bayard was defending the shattered walls of Mézières, M. de Cormontaigne, if he had been there, would have said, 'It is time to surrender.' Thus when Guise was repairing the breaches of Metz under the redoubled fire of the enemy, M. de Cormontaigne, if he had been there, would have said, 'It is time to surrender.'" Carnot of course allows that Cormontaigne was personally brave. His scorn is for the accepted principle, not for the man.

The World War was to confirm the value of resisting "to the last," by many examples, large and small. As the obstinate resistance of one obsolete fortress, Maubeuge, detained important German forces from the decisive battlefield on the Marne, so the fortitude of the defenders of small posts and localities repeatedly dammed the free flow of the attacker's resources and so cumulatively helped to prevent many a threatened disastrous breakthrough. Among many examples might be quoted the German defence of Flesquières on Nov. 20, 1917, against the British offensive towards Cambrai, and the British resistance at many points in face of the German offensives in March and April 1918, in particular that at Givenchy in April.

FORTLAGE, KARL (1806–1881), German philosopher, was born at Osnabrück. After teaching in Heidelberg and Berlin, he became professor of philosophy at Jena (1846), a post which he held till his death on Nov. 8, 1881. Originally a follower of Hegel, he turned to Fichte and Beneke (*q.v.*), with whose insistence on psychology as the basis of all philosophy he fully agreed. The fundamental idea of his psychology is impulse, which combines representation (which presupposes consciousness) and feeling (*i.e.* pleasure). Reason is the highest thing in nature, and God is the absolute Ego, the empirical egos being his instruments.

Fortlage's chief works are: *Genetische Geschichte d. Philos. seit Kant* (Leipzig, 1852); *System d. Psych. als empirische Wissenschaft* (2 vols., Leipzig, 1855); *Darstellung und Kritik der Beweise für das Dasein Gottes* (Heidelberg, 1840); *Beiträge zur Psych. als Wissenschaft* (Leipzig, 1875).

FORT LAUDERDALE, a city of south-eastern Florida, U.S.A., on the Atlantic ocean, 26m. above Miami; the county seat of Broward county. It is on the Atlantic Coast and the Dixie highways and is served by the Florida East Coast and the Seaboard Air Line railways. The population was 13,187 in 1927, by a special enumeration under the Federal census bureau, but in 1930 it was 8,666. Within the city limits are over 100m. of ocean, bay, river and canal frontage, and in 1928 a 35ft. harbour (Port Everglades), planned for completion in the following year, was under construction at Bay Mabel. Near by are the picturesque Everglades, abounding in tropical vegetation, in which the Seminole Indians still live in their primitive manner. The city was founded in 1837 and incorporated in 1911.

FORT LEE, a borough of Bergen county, New Jersey, U.S.A., on the Hudson river, opposite the northern part of New York city. It is served by electric trolleys and motor-coach lines and by ferry to New York, and is the New Jersey approach to the suspension bridge across the Hudson on which work was begun in 1928. The population was 5,761 in 1920, and was 8,759 in 1930 by the Federal census. It is a residential suburb, lying mainly along the top of the Palisades. To the north is the Interstate Palisades park. Early in the Revolution the Americans built a stronghold here, at first called Fort Constitution but later renamed after Gen. Charles Lee. From Sept. 15 to Nov. 20, 1776, it was held by Gen. Nathanael Greene with 3,500 men, but on the capture of Ft. Washington and the approach of Lord Cornwallis with 5,000

men it was necessary for him to abandon the post and join Washington in the retreat across the Jerseys. An unsuccessful attempt to recapture the fort was made by Gen. Anthony Wayne in 1780. In 1908 a monument was erected on the site. The borough was incorporated in 1904.

FORT MADISON, a city in the south-eastern corner of Iowa, U.S.A., on the Mississippi river; the county seat of Lee county. It is on Federal highway 61, and is served by the Burlington and the Santa Fe railways. The population was 11,229 in 1925 (State census) and was 13,779 in 1930 by the Federal census. It has railroad shops employing 900 men and various other manufacturing industries, with an output in 1927 valued at \$11,286,926, and is the seat of a State penitentiary. A fort was built here in 1808, and was named after James Madison, who was elected president that year. It was constantly harassed by the Sac and Fox Indians, who considered that its erection was a violation of the treaty made with them by Gen. W. H. Harrison in 1804. In Sept. 1813, the little garrison of 100 men abandoned the post, burning the fort behind them, and escaping to the river through a tunnel. Permanent settlement began in 1833. The town was incorporated in 1838 and chartered as a city in 1839. The court-house, built in 1842 and constantly in use ever since, is the oldest in the State.

FORT MYERS, a city of south-western Florida, U.S.A., on the Caloosahatchee river, 18m. from the Gulf of Mexico; the county seat of Lee county. It is served by the Atlantic Coast Line and the Seaboard Air Line railways, by motor bus lines with extensive connections and by steamers to gulf ports, and has a municipal airport. The population in 1925 (State census) was 6,674 (33% negroes) and in 1930 it was 9,082 by the Federal census. The river here is about 2m. wide. A deep-water channel to the gulf is projected, and plans are under way for a cross-State waterway to the East Coast, via Lake Okeechobee. Grapefruit, oranges, guavas, mangoes, avocados, papayas and bananas are grown extensively in this region. The city's boulevards are lined with royal palms, and nearly 100 varieties of palm are found in the city and along the banks of the river, which is stocked with tarpon. The city was founded in 1850 and incorporated in 1905. It has a commission-manager form of government. Between 1920 and 1927 the area was increased from 7 to 20 sq.m.; the population was multiplied by five; and the assessed valuation of property increased from \$5,885,350 to \$33,706,960.

FORTROSE, royal burgh and seaport, county of Ross and Cromarty, Scotland. Pop. (1931) 875. It is on the south-east coast of the peninsula of the Black Isle, 8 m. due N.N.E. of Inverness, 26½ m. by rail. It is the terminus of the Black Isle branch of the L.M.S.R.; there is communication with Fort George, 2½ m. distant, by ferry from Chanonry Ness. Fortrose consists of the two towns of Rosemarkie and Chanonry, about 1 m. apart, which were united into a free burgh by James II. in 1455 and created a royal burgh in 1590.

It had a monastery founded in the 6th century by St. Moluag, a friend of Columba's, and St. Peter's church built in the 8th century. In 1124 David I. instituted the bishopric of Ross, with its seat here, and the town acquired some fame for its school of theology and law. The cathedral is believed to have been founded in 1330 by the countess of Ross (her canopied tomb, against the chancel wall, still exists) and finished in 1485 by Abbot Fraser, whose previous residence at Melrose is said to account for the Perpendicular features of his portion of the work. It was Early Decorated in style, cruciform in plan, and built of red sandstone, but all that is left are the south aisles of the nave and the chancel, with the chapter-house, a two-storeyed structure, standing apart near the north-eastern corner. The cathedral and bishop's palace were destroyed by order of Cromwell, who used the stones for his fort at Inverness. Another relic survives in the bell of 1460. The academy is also an ancient foundation. The town is an agricultural centre and has a fishing harbour. Rosemarkie, in the churchyard of which is an ancient Celtic cross, is a resort for sea-bathing.

FORT SCOTT, a city of south-eastern Kansas, U.S.A., on the Marmaton river, 5m. from the Missouri State line; the

county seat of Bourbon county. It is on Federal highway 54 and 73 E, and is an important railroad centre, served by the Frisco, the Missouri-Kansas-Texas and the Missouri Pacific lines. The population in 1930 Federal census was 10,763. The city is built on a rolling plain, in the midst of the Kansas mineral fields, and is surrounded by a farming, stock-raising and dairying country. Coal, oil and gas, lead and zinc, building stone, cement rock and clays are found in the neighbourhood, and white sulphur water is obtained from Artesian wells (800ft. deep) in the city. It is an important shipping and supply centre, and has numerous and varied manufacturing industries, with an output in 1927 valued at \$3,371,367. The fort which preceded the town of Fort Scott was established in 1842, when eastern Kansas was still parcelled out among Indian tribes, and was abandoned in 1855. The town was planned in 1857 and chartered as a city in 1860.

FORT SMITH, a city on the western border of Arkansas, U.S.A., in the foothills of the Ozarks, on the south bank of the Arkansas river, at the mouth of the Poteau; the county seat of Sebastian county. It is at the intersection of Federal highways 64 and 71, and is served by the Fort Smith and Western, the Frisco, the Kansas City Southern, the Midland Valley, and the Missouri Pacific railways. A toll-free concrete bridge crosses the Arkansas to Oklahoma. The population was 28,870 in 1920 (85% native white) and was 31,429 in 1930 by the Federal census. Fort Smith is the business centre of a fine agricultural country, and of the Arkansas coal and gas region. The agricultural products of the four counties which touch its borders (two in Arkansas and two in Oklahoma) have an annual value of \$50,000,000. The city compresses 100,000 bales of cotton annually, and has large railroad shops, furniture and glass factories, and numerous other manufacturing industries. The factory output within the city limits in 1927 was valued at \$14,414,364. The wholesale houses do an annual business of \$55,000,000; retail trade amounts to \$26,000,000; and debits to individual accounts in the local banking institutions in 1927 totalled \$169,768,042. The public schools have an unusual endowment—the proceeds of lands formerly belonging to the military reservation, which were given to the city by Congress in 1884. There is a national cemetery here, containing 2,575 graves. The site of Fort Smith was known to the early French traders as Belle Pointe. A United States army post was established here in 1817; and the town was laid out in 1821, incorporated in 1842 and chartered as a city in 1845. It was at the head of navigation on the Arkansas, and the fort was the chief supply depot for the western posts. During the Civil War Fort Smith was strongly in sympathy with the Confederacy. The fort was seized by State troops in April 1861, and was reoccupied by Union forces in Sept. 1863. There was considerable unrest due to border "bushwhacking" throughout the war, and several skirmishes took place here in 1864. The first railroad reached Fort Smith in 1876, and in the decade 1880-90 the population rose from 3,099 to 11,311. The old fort, part of which still stands, was abandoned in 1871.

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART
THE GODDESS FORTUNA
AFTER A ROMAN BRONZE
STATUETTE

FORTUNA (FORTUNE), an Italian goddess of great antiquity, but apparently not native at Rome, where, according to universal Roman tradition, she was introduced by the king Servius Tullius as Fors Fortuna, and established in a temple on the Etruscan side of the Tiber outside the city, and also under other titles in other shrines. In Latium she had two famous places of worship, one at Praeneste, where there was an oracle of *Fortuna primigenia* ("original") frequented especially by women who, as we may suppose, desired to know the fortunes of their children or their own fortune in child-birth; the other at Antium, well known from Horace's ode (i. 35). It is highly probable that Fortuna was never a deity of the abstract idea

of chance, but represented the hopes and fears of men and especially of women at different stages of their life and experience; thus we find her worshipped as time went on under numerous cult-titles, such as *muliebris*, *virilis*, *huiusce diei*, *equestris*, *redux*, etc., which connected her supposed powers with individuals, groups of individuals, or particular occasions. Gradually she became more or less closely identified with the Gr. Τύχη, and was represented on coins, etc., with a cornucopia as the giver of prosperity, a rudder as the controller of destinies, and with a wheel, or standing on a ball, to indicate the uncertainty of fortune. In this semi-Greek form she came to be worshipped over the whole empire, and Pliny (*N.H.* ii. 22) declares that in his day she was invoked in all places and every hour. She even became identified with Isis, and as *Panthea* was supposed to combine the attributes of all other deities.

The best account of this difficult subject is to be found in Roscher's *Lexikon* (s.v.); see also Wissowa, *Religion und Kultus der Römer*, p. 256 foll.; W. Warde Fowler, *Roman Essays* (1920) p. 64 foll. (W. W. F.)

FORTUNATIANUS, ATILIUS, Latin grammarian of the fourth century A.D. He was the author of a treatise on metres, dedicated to one of his pupils, a youth of senatorial rank. The manual discusses the fundamental ideas of metre and the rules of prosody, and ends with an analysis of the metres of Horace. The chief authorities used are Caesius Bassus and the Latin adaptation by Iuba the grammarian of the Τέχνη of Heliodorus.

Editions of the *Ars* in H. Keil, *Grammatici Latini*, vi., and separately by him (1885).

FORTUNATUS, the hero of a popular European chap-book. He was a native, says the story, of Famagusta in Cyprus, and meeting the goddess of Fortune received a purse which was replenished as often as he drew from it. He wandered through many lands, and at Cairo was the guest of the sultan. Among the treasures which the sultan showed him was a hat which had the power of transporting its wearer to any place he desired. Of this he feloniously possessed himself, and returned to Cyprus, where he led a luxurious life. On his death he left the purse and the hat to his sons Ampedo and Andelosia; but they, by their recklessness and folly fell on evil days. The moral of the story is obvious: men should desire reason and wisdom before all the treasures of the world. In its full form the history of Fortunatus occupies in Karl Simrock's *Die deutschen Volksbücher*, vol. iii., upwards of 158 pages. The style and allusions indicate a comparatively modern date for the authorship; but the nucleus of the legend can be traced back to a much earlier period. The earliest known edition of the German text of Fortunatus appeared at Augsburg in 1509. Innumerable versions occur in French, Italian, Dutch and English. The story was dramatized by Hans Sachs in 1553, and by Thomas Dekker in 1600. Tieck has used the legend in his *Phantasia*, and Chamisso in *Peter Schlemihl*; and Ludwig Uhland left an unfinished narrative poem entitled "Fortunatus and his Sons."

See Fr. W. V. Schmidt, *Fortunatus und seine Söhne, eine Zauber-Tragödie*, von Thomas Decker, mit einem Anhang, etc. (1819); J. J. Görres, *Die deutschen Volksbücher* (1807).

FORTUNATUS, VENANTIUS HONORIUS CLEMENTIANUS (530-609), bishop of Poitiers, and the chief Latin poet of his time, was born near Ceneda in Treviso in 530. He studied at Milan and Ravenna, with the special object of excelling as a rhetorician and poet, and in 565 he journeyed to France, where he was received with much favour at the court of Sigbert, king of Austrasia, whose marriage with Brunhild he celebrated in an *epithalamium*. After remaining a year or two at the court of Sigbert he travelled in various parts of France, visiting persons of distinction, and composing verses. At Poitiers he visited Queen Radegunda, and she induced him to prolong his stay in the city indefinitely. Here he enjoyed the friendship of Gregory of Tours and others. He was elected bishop of Poitiers in 599, and died about 609. The later poems of Fortunatus were collected in 11 books, and consist of hymns (including the *Vexilla regis prodeunt*, Englished by J. M. Neale as "The royal banners forward go"), epitaphs, poetical epistles, and verses in honour of

his patroness Radegunda and her sister Agnes, the abbess of a nunnery at Poitiers. He also wrote a large poem in 4 books in honour of St. Martin, and several lives of the saints in prose.

An edition of the works of Fortunatus was published by C. Brower at Fulda in 1603 (2nd ed., Mainz, 1617). The edition of M. A. Luschi (Rome, 1785) was afterwards reprinted in Migne's *Patrologiae cursus completus*, vol. lxxxviii. See the edition by Leo and Krusch (Berlin, 1881-1885). There are French lives by Nisard (1880) and Leroux (1885).

FORTUNY, MARIANO JOSE MARIA BERNARDO (1838-1874), Spanish painter, was born at Reus on June 11, 1838. He entered the Academy of Barcelona, where he worked for four years under Claudio Lorenzale, and in March 1857 he gained a scholarship which enabled him to complete his studies in Rome. On the outbreak of the war between Spain and the emperor of Morocco in 1859 Fortuny was sent by the authorities of Barcelona to paint the most striking incidents of the campaign. He returned to Spain in 1860. He visited Paris in 1868 and shortly afterwards married the daughter of Federico Madrazo, the director of the royal museum at Madrid. Another visit to Paris in 1870 was followed by a two years' stay at Granada, but then he returned to Rome where he died on Nov. 21, 1874.

The work which Fortuny accomplished during his short life is distinguished by facility of execution and cleverness in the arrangement of brilliant hues.

See J. C. Davillier, *Fortuny, sa vie, son oeuvre, sa correspondance, etc.* (1875); C. Yriarte, *Fortuny* (*Artistes célèbres* series) (1886).

FORT WAYNE, a city of north-eastern Indiana, U.S.A., at the confluence of the St. Joseph and the St. Mary rivers to form the Maumee; the county seat of Allen county. It is on Federal highways 24, 27 and 30 (the Lincoln); has a municipal airport; and is served by the Indiana Service Corporation, the New York Central, the Nickel Plate, the Pennsylvania and the Wabash railways. The population was 86,549 in 1920 (90.6% native white) and was 114,946 in 1930.

The city has an altitude of 770ft., a land area of 16.8 sq.m. and an assessed valuation in 1927 of \$234,653,530. The streets are laid out on a rectangular plan, and are shaded with a profusion of trees. A zoning system is in force. The city has an official planning commission, while an unofficial committee is preparing a general scheme for the development of the adjacent area outside the city limits. The surrounding country is a rich agricultural region, with extensive forests of hardwood timber. Fort Wayne is an important railway centre, and three of the roads maintain large shops, employing 3,000 men. The value of the city's factory output in 1927 reached a total of \$95,365,951. Over 200 different articles are manufactured, chief among which are car wheels, electrical machinery and equipment, oil tanks and pumps, hosiery, overalls, agricultural machinery, pianos and organs. The State School for Feeble-minded Youth is situated here.

The Miami Indians had several villages in this neighbourhood, and the principal one, Kekionaga (Miami Town or Great Miami village), was within the limits of the present city. A French trading post was established about 1680 on the east bank of the St. Mary, and in 1749-50 the French fort was moved to the east bank of the St. Joseph. The English occupied the fort in 1760, and in 1763 it was captured by Pontiac, after a siege of more than three months. In 1790 the Miami villages were destroyed. In Sept. 1794, Gen. Anthony Wayne built a stockade fort on the south bank of the Maumee, where Old Fort park now lies. By the treaty of Greenville, concluded by General Wayne on Aug. 3, 1795, a tract of 6 sq.m., including the sites of the Miami villages, was ceded to the United States and free passage to Fort Wayne and down the Maumee to Lake Erie was guaranteed by the Indians. Important treaties affecting other regions were made at Fort Wayne with the Indians by General W. H. Harrison in 1803 and 1809. In Sept. 1813, the fort was besieged by Indians, who withdrew on the arrival of General Harrison with 2,700 men. It was abandoned on April 19, 1819, and no trace of it remains. Permanent settlement dates from 1815. A town was platted in 1824 and was made the county seat, and the city was chartered in 1840. It was an important fur-trading depot until 1830, and in 1843 its growth was stimulated by the opening of the Wabash

and Erie canal. The population was 4,282 in 1850; 26,880 in 1880. It increased 68% between 1880 and 1900; 92% between 1900 and 1920.

FORT WILLIAM, police burgh, Inverness-shire, Scotland. Pop. (1931) 2,527. It lies at the north-eastern end of Loch Linnhe, an arm of the sea, about 62 m. S.S.W. of Inverness by road or canal, and was, in bygone days, one of the keys of the Highlands. It is 122½ m. N.E. of Glasgow by the L.N.E. railway. The fort, at first called Kilmallie, was built by General Monk in 1655 to hold the Cameron men in subjection, and was enlarged in 1690 by General Hugh Mackay, who renamed it after William III., the burgh then being known as Maryburgh in honour of his queen. The Jacobites unsuccessfully besieged it in 1715 and 1746. The fort was dismantled in 1860, and demolished in 1890 to provide room for the railway and the station. Amongst the public buildings is the low-level meteorological observatory, connected with the observatory on the top of Ben Nevis, until the latter was closed in 1904. There are distilleries about 2 m. north-east. Ewen MacLachlan (1775-1822), the Gaelic poet, was born in the parish. Fort William is a tourist resort and place of call for steamers passing through the Caledonian canal. The town is the point from which the ascent of Ben Nevis—4½ m. directly east-south-east—is commonly made. At Corpach, about 2 m. N. the Caledonian canal begins. Both the Lochy and the Nevis enter Loch Linnhe immediately north of Fort William. A mile and a half from the town, on the Lochy, stands the ruin of Inverlochy castle, quadrangular with a round tower at each corner. Close by is the scene of the battle of Feb. 2, 1645, in which Montrose completely defeated the earl of Argyll. Large works for the utilization of the water power of the district, including a tunnel through the Ben Nevis group, were in course of construction in 1928.

FORT WILLIAM, the principal city of Thunder Bay district, Ontario, Canada, 426 m. (by rail) E.S.E. of Winnipeg, on the Kaministiquia river, about a mile from Lake Superior. It is on the Canadian Pacific and Canadian National railways, and served by several steamship lines. Port Arthur lies 4 m. to the N.E. Fort William contains numerous grain elevators, railway repair shops and docks, paper and wood pulp mills, and has a large export trade in grain and other farm produce. Minerals are also exported from the mining district, of which it is the centre. Industries, such as saw, planing and flour mills, have also sprung up. Pop. (1931) 26,277.

FORT WORTH, a city of northern Texas, U.S.A., 30 m. W. of Dallas, at the confluence of Clear Fork with the West Fork of the Trinity river; the county seat of Tarrant county, a port of entry in the San Antonio customs district, the greatest railway centre of the south-west, and the metropolis of the oil-fields and cotton-producing area of western Texas. It is on four transcontinental highways (Bankhead, Dixie Overland, Colorado-to-Gulf and Meridian); is served by the Colorado and Southern, the Frisco, the Missouri, Kansas and Texas, the Missouri Pacific, the Rock Island, the St. Louis South-western, the Santa Fe, the Southern Pacific, the Texas and Pacific and the Trinity and Brazos Valley railways; and has a well-equipped municipal air port (Meacham field), air mail to Chicago, the East and the cities of southern Texas, and air-transportation service. The area is 50 square miles. The population was 106,482 in 1920, of whom 15,896 were negroes and 7,359 were foreign-born white; and was estimated by the census bureau at 170,600 in 1928. The Federal census figures for 1930, after large adjacent areas had been annexed in 1922, 1924 and 1928, were 163,447.

The city has a beautiful and healthy location on a level tract above the river, at the rise of the western foothills, with an elevation averaging about 700 feet. The normal annual mean temperature is 65.3° F, and the percentage of possible sunshine during the year is 70. Much of the city is of recent construction. Ten blocks in the business centre were destroyed by fire in 1909, and many fine sky-scrapers (hotels and office-buildings) have been built since the World War to meet the rapidly growing demands. Building permits for the four years 1924-27 represented values of over \$54,000,000. The assessed valuation of property in 1927 was \$166,741,585. Under the city plan commission, created by the

charter of 1925, a comprehensive city plan is being developed.

Parks and Schools.—There are 36 parks, containing 3,929 acres. The water supply comes from Lake Worth (14 m. long by 1 m. wide), formed by damming the West Fork 5 m. above the city, which has been developed as a beautiful recreation resort. Two new dams, to cost \$6,500,000, were under construction in 1928. It is surrounded by summer homes; Meandering Road, a 30 m. drive, follows its shore; a popular bathing beach is maintained by the municipality; and there is a large commercial amusement park, with a "board walk" and a casino. Work has been started on a water conservation project which involves the creation of additional large reservoirs. Natural gas is brought in by pipe lines from 15 fields, and the supply is expected to last for generations. Public schools recently built at a cost of over \$3,500,000 have caught up with the needs of the rapidly growing population, and bring the total number to 44 elementary and 9 high schools. Texas Christian university (founded in 1873 at Thorp Springs as Add-Ran college, moved to Waco in 1895 and to Fort Worth in 1910) has an enrolment of about 2,000. Texas Woman's college (enrolment 1,000) was established in 1914, and the older Polytechnic college, under the auspices of the Methodist Episcopal Church, South, was merged with it. The Southwestern Baptist theological seminary (established 1916) has an attendance of 750. There are several large hospitals, including the Methodist hospital (400 beds), completed in 1927 at a cost of \$1,000,000.

Economic Resources.—Fort Worth's present era of rapid expansion began during the war, with the increased demand for the horses, mules, grain and other products of the south-west; the establishment of Camp Bowie (1917), where 50,000 national guardsmen were trained, and three flying fields for the training of Canadian and American aviators; and the erection (1918) of the United States helium gas plant, for the production of the non-combustible, non-inflammable gas for the inflation of dirigibles. It has a firm foundation for the future in the development of the agricultural and mineral resources of western Texas. With the discovery of the Ranger and Burkburnett and other important oil-fields, Fort Worth became the geographical centre of the oil-producing region of the south-west. By 1927 it was the focus of more pipe lines than any other city; its six refineries had a daily capacity of 50,000 barrels of crude oil; and nearly all the important companies operating in the south-western fields had established offices here. Since 1920 the transition in western Texas from ranching to stock-farming and diversified agriculture (especially cotton, wheat and feed crops) has added a large and prosperous population to Fort Worth's trading territory, has supplied raw materials for new industries, has stimulated meat-packing and flour and feed mills and enlarged the grain and live stock markets. Between 1920 and 1927, it is estimated, 6,000,000 ac. of new land were brought under cultivation in west Texas and the population was increased by 750,000.

Industries and Trade.—Fort Worth is the largest terminal grain market, and the only primary grain market, in the South. Its elevators provide storage for 12,000,000 bu. and its flour and feed mills have a daily capacity of 65,000 barrels. It is also the largest live stock market and the largest meat-packing centre south of Kansas City. The packing plants employ over 4,000 persons and use \$90,000,000 worth of live stock a year. The Texas South-western Cattle Raisers Association has its headquarters here, and the South-western Exposition and Fat Stock Show brings every spring an array of fine blood stock.

Among the city's manufactures packing-house products rank first (on the basis of value), petroleum products second and grain products third. Others of importance are pumps, windmills and oil-field supplies; cotton-seed oil, cotton goods, hosiery, cement, concrete pipe, furniture, shoes, clothing and printing and publishing. Among the publications are three daily papers, several journals devoted to the interests of cattle raisers and petroleum producers, with the organs of the State Teachers Association and of the State Medical Association, both of which have their headquarters in the city. There are large foundries, machine shops and railroad repair shops. The output of the factories within the city limits in 1927 was valued at \$109,607,003; the total for all the

manufacturing industries of the county is estimated at about \$200,000,000 annually.

As a wholesale centre Fort Worth ranks first among the cities of the south-west in the distribution of food products, the annual value of this item reaching \$200,000,000. Petroleum products amount to \$50,000,000. Furniture, agricultural machinery and oil-field supplies are other lines in which the city's wholesalers do a large business. The Texas Wholesale Produce Association and the Texas Grain Dealers Association have their headquarters here. Banks debits to individual accounts in 1927 amounted to \$1,113,887,856. Postal receipts were \$1,908,221. Fort Worth is headquarters of the U.S. Railway Mail Service, 11th district.

History.—At the close of the Mexican War Gen. Winfield Scott sent a troop of soldiers to north Texas to establish a post for the protection of the sparsely settled territory from the Indians. It was established in 1849, and named Camp Worth after Brigadier General Worth. A few months later the war department changed the name to Fort Worth, but no fort was ever erected, and in 1853 the troops were sent to Ft. Belknap. The settlement became a trading-post for the scattered ranchers, developing some commerce in buffalo hides and bones. It had a brief boom in 1873, when the Texas and Pacific Railway began building towards it, but this collapsed when construction work was abandoned (25 m. E. of the town) on September 1, at the first crash of the great financial panic. Substantial progress began when the railway reached the city in 1876. Fort Worth had been chosen as the county seat in 1860, and had been incorporated as a city in the boom days of 1873, when it reached a population of 4,000. In 1880 the population was 6,663; in 1900, 26,688; in 1910, 73,312. A commission form of government was adopted in 1906, which was superseded in 1925 by a council-manager form. In November, 1925, the citizens voted for a bond issue of \$7,659,999, to be used in public improvements, the largest bond issue ever voted in a Texas city.

FORTY, the cardinal number equal to four tens. The name "The Forty" has been given to various bodies, particularly to a judicial body of 40 members in ancient Athens who tried small cases in the rural districts, and to a court of criminal jurisdiction and two civil appeal courts in the Venetian republic. The French Academy (*see ACADEMIES*) has also been known as "The Forty" or "The Forty Immortals." The period just before the repeal of the corn laws in the United Kingdom is frequently alluded to as the "hungry forties"; and the "roaring forties" is a sailor's name for the stormy region between 40° and 50° S. lat.

FORUM, an open place used, like the Greek *agora* (*q.v.*), for the transaction of mercantile, judicial, or political business. It was level, rectangular in form, surrounded by porticoes, basilicas, courts of law, and other public buildings. In the laws of the Twelve Tables the word is used of the vestibule of a tomb; in a Roman camp the forum was an open place immediately beside the *praetorium*; and the term was no doubt originally applied generally to the space in front of any public building or gateway. In Rome (*q.v.*) itself forum was almost a proper name, denoting the flat and formerly marshy space between the Palatine and Capitoline hills (also called Forum Romanum), which even during the regal period afforded the accommodation necessary for such public meetings as could not be held within the area Capitolina. In early times the Forum Romanum was used for athletic games, and over the porticoes were galleries for spectators; there were also shops of various kinds. But with the growth of the city, more than one forum became necessary, and under the empire a considerable number of *civilia* (judicial) and *venalia* (mercantile) fora came into existence. In addition to the Forum Romanum, the fora of Caesar and Augustus belonged to the former class; the forum *boarium* (cattle), *holitorium* (vegetable), etc., to the latter. The forum Nerva (also called *transitorium* or *pervium*, because a road led through it to the Forum Romanum), and those of Trajan and Vespasian, although intended to facilitate the course of public business, were chiefly erected to embellish the city. In Pompeii, at the north-east end of the forum, there was a *macellum* (market) and shops for provisions, and on the east side a cloth-workers' exchange; at Timgad in North Africa (a military colony

founded under Trajan) the whole of the south side of the forum was occupied by shops. The forum was paved, and although on festal occasions chariots were driven through, it was not a thoroughfare and was enclosed by gates at the entrances, of which traces have been found at Pompeii. The word *forum* frequently appears in the names of Roman market towns; as, for example, in Forum Appii, Forum Iulii (*Fréjus*), Forum Livii (*Forlì*), Forum Sempronii (*Fossombrone*). These were distinguished from mere *vici* by the possession of a municipal organization, which, however, was less complete than that of a prefecture. In legal phraseology the word is practically equivalent to "court" or "jurisdiction."

For the *fora* at Rome, *see* *ROME: Archaeology*, and works quoted, cf. also J. E. Sandys, *Companion to Latin Studies* (1921), with useful bibliography.

FORUM APPII, an ancient post station on the Via Appia, 43 m. S.E. of Rome, founded, no doubt, by the original constructor of the road. Horace mentions it as the usual halt at the end of the first day's journey from Rome. It was the starting-point of a canal parallel to the road through the Pomptine Marshes and used instead of it at the time of Strabo and Horace (*see* *APPIA, VIA*). It is mentioned also as a halting place in the account of Paul's journey to Rome (*Acts xxviii. 15*). Under Nerva and Trajan the road was repaired; one inscription records the paving with *silex* (replacing the former gravelling) of the section from Tripontium, 4 m. N.W., to Forum Appii. A post station was placed here by Pius VI. when the Via Appia was reconstructed.

FORUM TRAIANI, an ancient town of Sardinia, on the river Thyrsus (*Tirso*), and a station on the Roman road through the centre of the island from Carales to Olbia and Turris Libisonis. The best preserved of its ruins are the baths, erected over hot mineral springs. The tanks for collecting the water and the large central *piscina* are noteworthy. The bridge over the Tirso has been to some extent modernized. On the opposite bank near the old church of S. Lussorio, who is said to have been beheaded here (*see PRISA*), are the scanty remains of an amphitheatre. Not far off is a group of *nuraghi*, of which that of S. Barbara in the commune of Villanova Truscheddu is one of the finest.

FOSCARI, FRANCESCO (1373-1457), doge of Venice, belonged to a noble Venetian family, and held many of the highest offices of the republic—ambassador, president of the Forty, member of the Council of Ten, inquisitor, procurator of St. Mark, *avvogadore di comun*, etc. His first wife was Maria Priuli and his second Maria Nani; of his many children all save one son (Jacopo) died young. He was elected doge in 1423, and reigned for 34 years. In proclaiming the new doge the customary formula which recognized the people's share in the appointment and asked for their approval—the last vestige of popular government—was finally dropped. Through the doge's influence Venice joined the Florentines in their campaign against Milan, which was carried on with varying success for eight years. In 1444 began the domestic tragedy by which the name of Foscari has become famous. The doge's son Jacopo was accused of taking bribes. He escaped, but was tried in contumacy before the Council of Ten and banished to Treviso (1446). Four years later Ermolao Donato, who had been a member of the Ten at the time of the trial, was assassinated, and Jacopo Foscari was suspected of complicity in the deed. After a long inquiry he was brought to trial for the second time, and was banished to Candia for the rest of his life, with a pension of 200 ducats a year. In 1456 he was accused of treasonable correspondence with the duke of Milan and the sultan of Turkey. He was tried and condemned to a year's imprisonment, to be followed by a return to his place of exile. Jacopo died at Candia, in Jan. 1457. The doge was overwhelmed with grief at this bereavement and, incapable of attending to business, he was finally compelled to abdicate, and died two days later (Nov. 1, 1457).

Legend has added to the story many picturesque though quite apocryphal details, most of them tending to show the iniquity and harshness of Jacopo's judges and accusers, whereas, as we have shown, he was treated with exceptional leniency. The most accurate account is contained in S. Romanin's *Storia documentata di Venezia*, lib. x. cap. iv. vii. and x. (Venice, 1855); where the original authorities are quoted; *see* also Berlan, *I due Foscari* (Turin, 1852). Among the poetical works on the subject Byron's tragedy, *The Two Foscari*, is the most famous (1821), and Rogers' poem *Italy* (1821); Giuseppe Verdi

composed an opera on the subject entitled *I due Foscari*.

FOSCOLO, UGO (1778–1827), Italian writer, was born at Zante in the Ionian Isles on Jan. 26, 1778. At the university of Padua one of his teachers was the abbé Cesarotti, author of a version of Ossian, who had some influence on Foscolo's literary tastes; his own early knowledge of modern Greek aided his studies in ancient Greek. Foscolo soon began to take an active part in the stormy political discussions provoked by the fall of the republic of Venice. He was a prominent member of the national committees, and addressed an ode to Napoleon the liberator, expecting the overthrow of the effete Venetian oligarchy, and the establishment of a free republican government.

The treaty of Campo Formio (Oct. 17, 1797), by which Napoleon handed Venice over to the Austrians, gave Foscolo a rude shock, reflected in the *Letters of Jacopo Ortis* (1798), a species of political *Werther*—for the hero of Foscolo embodies the mental sufferings and suicide of a disillusioned Italian patriot. Still hoping that his country would be freed by Napoleon, he served as a volunteer in the French army, took part in the battle of the Trebbia and the siege of Genoa, was wounded and made prisoner. When released he returned to Milan, and there gave the last touches to his *Ortis*, published a translation of and commentary upon *Callimachus*, commenced a version of the *Iliad*, and began his translation of Sterne's *Sentimental Journey*. In 1807 appeared his *Carme sui sepolcri*; the mighty dead are summoned from their tombs, as ages before they had been in the masterpieces of Greek oratory, to fight again the battles of their country. The apostrophe to Florence in this poem is among the famous passages in Italian poetry. In his inaugural lecture on the origin and duty of literature, delivered in Jan. 1809 when he was appointed to the chair of Italian eloquence at Pavia, Foscolo urged his young countrymen to study letters, not in obedience to academic traditions, but in their relation to individual and national life and growth. Soon afterward Napoleon decreed the abolition of the chair of national eloquence in all the Italian universities. The supposed allusions to Napoleon in his tragedy of *Aiace* brought suspicion on the author; and he removed for safety to Florence. There he wrote the faultlessly constructed tragedy of *Ricciarda*, the *Ode to the Graces*, left unfinished, and completed his version of the *Sentimental Journey* (1813). He returned to Milan in 1813, until the entry of the Austrians; thence he passed into Switzerland, where he wrote a fierce satire in Latin on his political and literary opponents; and finally he sought refuge in England at the close of 1816.

During the eleven years passed by Foscolo in London, he contributed to the *Edinburgh* and *Quarterly Reviews*, wrote dissertations in Italian on the text of Dante and Boccaccio, and English essays on Petrarch. He was at one time in prison for debt in London, and the experience embittered him. He died at Turnham Green, London, on Oct. 10, 1827. Forty-four years after his death, in 1871, his remains were removed to Florence, and reinterred, with much ceremony in the church of Santa Croce. To that solemn national tribute Foscolo was fully entitled. For the originality of his thoughts and the splendour of his diction his country honours him as a great classic author. With all his defects of character, and through all his vicissitudes of fortune, he was always a sincere and courageous patriot.

His works were edited by F. Le Monnier (Florence 1854–1862). For detailed bibliography of his works see A. Ottolini, *Bibliografia Foscoliana* (Florence 1921). For his life see biographies by G. Chiarini (Florence, 1910), and by E. Donadoni (Milan, 1910); also A. Graf, *Foscolo, Manzoni, Leopardi* (1898, new ed. 1924–25).

FOSDICK, HARRY EMERSON (1878–), American divine, was born at Buffalo, N.Y., on May 24, 1878. He graduated from Colgate university in 1900, and from Union theological seminary, New York city, in 1904. Ordained into the Baptist ministry in 1903, he was pastor of the First church, Montclair, N.J., 1904–15. He rapidly acquired a high reputation as a preacher especially among the universities. Becoming instructor in homiletics at Union theological seminary in 1908, he was appointed Morris K. Jesup professor of practical theology in 1915. In 1918 he was installed as a special preacher of the First Presbyterian

church of New York. His plea that the door of Christian fellowship be left open to all who sincerely desired to follow Christ regardless of specific credal belief made him the subject of attack, however, and the judicial commission of the Church decided that Dr. Fosdick must take the vows of a Presbyterian or vacate his pulpit. Upon his resignation, which took effect in 1925, the Park avenue Baptist church of New York called him to its pastorate, agreeing to open its membership to all Christians without insisting on its traditional ordinance of baptism.

Dr. Fosdick's works include *The Second Mile* (1909); *The Manhood of the Master* (1913); *The Assurance of Immortality* (1913); *The Meaning of Prayer* (1915); *The Challenge of the Present Crisis* (1917); *The Meaning of Faith* (1917); *The Meaning of Service* (1920); *Christianity and Progress* (1922); *Twelve Tests of Character* (1923); *The Modern Use of the Bible* (Yale lectures, 1924); *Adventurous Religion* (1926); *A Pilgrimage to Palestine* (1927); *Spiritual Values and Eternal Life* (1927); *Modern Use of the Bible* (1929).

FOSS, EDWARD (1787–1870), English lawyer and biographer, was born in London on Oct. 16, 1787. He was a solicitor by profession, and spent the last thirty years of his life in the study of legal antiquities. His *Judges of England* (9 vols., 1848–1864) is a standard work. He was one of the founders of the Incorporated Law Society, of which he was president in 1842 and 1843. He died on July 27, 1870.

FOSSA or FOUSSA (*Cryptoprocta ferox*), a civet-like mammal peculiar to Madagascar, where it is the largest carnivorous animal. It is about twice the size of a cat (5ft. from nose to end of tail), with short close fur of nearly uniform pale brown. It is nocturnal, frequently attacks and carries off goats, and shows great ferocity when wounded. (See CARNIVORA.)

FOSSANO, a town and episcopal see of Piedmont, Italy, province of Cuneo, 15 m. N.E. of the town of that name by rail, 1,180 ft. above sea-level. Pop. (1921) 8,018 (town), 18,484 (commune). It has an imposing castle with four towers, begun by Filippo d'Acaia in 1314. The place appears as a commune in 1237, but in 1251 had to yield to Asti. It finally surrendered in 1314 to Filippo d'Acaia, whose successor handed it over to the house of Savoy. It lies on the main line from Turin to Cuneo, and has a branch line to Mondovì.

FOSSANUOVA, an abbey of Italy, province of Rome, near the railway station of Sonnino, 64 m. S.E. of Rome. It is the finest example of a Cistercian abbey, and of the Burgundian Early Gothic style, in Italy. The church (1187–1208) is closely similar to that of Casamari. The other conventual buildings also are noteworthy. St. Thomas Aquinas died here in 1274.

FOSSE (or Foss) WAY, the early English name of a Roman road or series of roads in Britain, used later by the English, running from Lincoln by Leicester and Bath to Exeter. Almost all the Roman line is still in use as modern road. It passes from Lincoln through Newark and Leicester (the Roman *Ratae*) to High Cross (*Venonae*), where it intersects Watling Street at a point often called "the centre of England." Hence it runs to Moreton-in-the-Marsh, Cirencester, Bath and Ilchester, crosses the hills near Chard, Axminster and Honiton, and enters Exeter. (See further under *ERMINE STREET*.)

FOSSICK (probably an English dialectical expression, meaning fussy or troublesome), a term applied by the gold diggers of Australia to the search for gold by solitary individuals, in untried localities or in abandoned diggings. A "fossicker," or pocket miner, is one who buys up the right to search old claims, in the hope of finding gold overlooked by previous diggers. He is comparable with the "chlorider" of the United States.

FOSSIL CYCAD NATIONAL MONUMENT is a reservation (320 ac. in area) situated only a few miles south of Hot Springs in Fall River county, South Dakota, U.S.A. Within its bounds are found unusual deposits of fossil plants.

FOSSIL PLANTS: see PALAEOBOTANY.

FOSSOMBRONE, a town and episcopal see of the Marches, Italy (anc. *Forum Sempronii*), province of Pesaro and Urbino, 11 m. E.S.E. of the latter by road, 394 ft. above sea-level. Pop. (1921) town, 3,933, commune, 10,259. The town is in the valley of the Metauro, at the meeting-point of roads to Fano, to the

Furlo pass and Fossato di Vico (the ancient Via Flaminia), to Urbino and to Sinigaglia, the last crossing the river by a fine bridge. Above the town is a mediaeval castle. Silk throwing is carried on.

The ancient Forum Sempronii lay about 2 m. to the N.E. at S. Martino al Piano, where remains have been found. It was a station on the Via Flaminia. Excavations have led to the discovery of houses and of other buildings on the ancient road. It already had a bishop in the years 499-502.

FOSSOMBRONI, VITTORIO, COUNT (1754-1844), Tuscan statesman and mathematician, was born at Arezzo. In 1796 he was made minister for foreign affairs, but on the French occupation of Tuscany in 1799 he fled to Sicily. On the erection of the grand duchy into the ephemeral kingdom of Etruria, under the queen-regent Maria Louisa, he was appointed president of the commission of finance. In 1809 he went to Paris as one of the senators for Tuscany to pay homage to Napoleon. He was president of the legislative commission on the restoration of the grand duke Ferdinand III. in 1814, and was prime minister for thirty years until his death in 1844. He was the real master of Tuscany, and the bases of his rule were equality of all subjects before the law, honest administration of justice and toleration of opinion.

FOSTER, JOHN: see ORIEL, JOHN FOSTER, *Baron*.

FOSTAT. The first Muslim capital of Egypt, founded by Amr, the Persian conqueror of Egypt in A.D. 641. Fostat signifies "the tent," being built on the site where Amr pitched his tent when besieging Babylon. It later became known as Masr or Misr, this being also the Arabian name for Cairo, later for Egypt, and was the residence of the naibs or lieutenants. At the present time it is represented by Masr-el-Atika or "Old Cairo." See CAIRO; EGYPT; and ARABIA.

FOSTER, SIR GEORGE EULAS (1847-), Canadian statesman, was born in New Brunswick Sept. 3, 1847. Educated in New Brunswick, Edinburgh and Heidelberg, he took up teaching in Canada. In 1882 he entered the Canadian Parliament as Conservative member for New Brunswick, and in 1885 became Minister of Marine and Fisheries. From 1888-96 he was Minister of Finance. In the Borden administration of 1911 he was Minister of Trade and Commerce, retaining the portfolio in the Union Govt. of 1917, in which year he was summoned to the Senate. He was a great advocate of preferential trade within the Empire, and in 1903 made a series of speeches in England in support of Mr. Chamberlain's policy. Sworn of the Imperial Privy Council in 1916, he was in the same year appointed one of Great Britain's four representatives at the Economic Conference at Paris. In 1918 Foster was created K.C.M.G., and he represented Canada at the Peace Conference, 1919, at the first assembly of the League of Nations in 1921, when he was elected a vice-president, and again at the seventh assembly in 1926.

FOSTER, SIR MICHAEL (1836-1907), English physiologist, was born at Huntingdon on March 8, 1836, the son of a surgeon. After a brilliant career at University college, London, he studied for some time in Paris, and then taught physiology for two years at University college. In 1870 he was appointed by Trinity college, Cambridge, to its praelectorship in physiology, and 13 years later he became the first occupant of the newly-created chair of physiology in the university, holding it till 1903. He had a very large share in the organization and development of the Cambridge biological school. From 1881 to 1903 he was biological secretary of the Royal Society. In 1899 he was created K.C.B., and was returned as a Unionist for London university in 1900, but crossed the floor of the House in 1902. In 1906 he stood as a Liberal, and was defeated. His chief writings were a *Textbook of Physiology* (1876), which became a standard work, and *Lectures on the History of Physiology in the 16th, 17th and 18th Centuries* (1901), lectures delivered at the Cooper Medical college, San Francisco, in 1900. He died in London on Jan. 29, 1907.

FOSTER, MYLES BIRKET (1825-1899), English painter, was born at North Shields, and is said to have been able to draw before he could speak. At the age of 16 he entered the workshop of Ebenezer Landells, a wood engraver, with whom he worked for six years as an illustrative draughtsman, devoting himself mainly to landscape. About 1861 he abandoned illustration for painting, his subjects, executed chiefly in water colours, being landscapes and rustic scenes, with figures, mainly of children. He was elected in 1860 associate and in 1862 full member of the Royal Society of Painters in Water Colours. He died at Weybridge on March 27, 1899.

See H. M. Cundall, *Birket Foster*, R.W.S. (1906).

FOSTER, STEPHEN COLLINS (1826-1864), American composer, was born July 4, 1826 at Pittsburgh, Pa. In 1852 he "concluded . . . to pursue the Ethiopian business without fear or shame" and "to establish my name as the best Ethiopian songwriter." This he said to E. P. Christy, who, with Foster's consent, originally figured as author and composer of "The Old Folks at Home," and whose minstrel troupe helped to popularize Foster's songs in America and Europe, among persons of all classes and qualities alike.

He was born of prosperous middle-class parentage of mainly Scotch-Irish stock. With the exception of two years spent at Athens Academy, some restless months at Jefferson college, and the period (1846-50) when he was employed as a bookkeeper in Cincinnati, he spent most of his life in Pittsburgh. In July 1860, he finally took up his residence in New York city, where his death, due to an accident, occurred on Jan. 13, 1864.

His musical inclinations appeared at the age of six. His first recorded attempt at composition ("Tioga Waltz" for an ensemble of flutes!) occurred about 1840. More promising was the sentimental song "Open thy lattice, love" (1842). Significantly enough, he became the star-performer of a boyish "Thespian Society" in negro-minstrel jingles (in trade jargon called Ethiopian), but Pittsburgh with its meagre fare of better music was sterile soil for higher creative attainments, especially since Foster, though enjoying great music never felt stirred to serious study of composition. Nor did his father, who in 1841 commented on Stephen's "strange talent" and "devotion to music," ever comprehend that Nature beckoned for its serious cultivation. Hence, Foster's technical equipment remained very slender, but it sufficed for his purposes and was supported by a keen ear for imperfections in first ideas.

Foster invented no new type of song, but with his occasionally magic gift for felicitous turns of melody or phrase, he outshone numerous competitors in his two chosen fields of simple song, then equally in vogue—the sentimentalized drawing-room "ballad" and the "Ethiopian" song. To the absurdities of the "Ethiopian" song he contributed freely, for example his once enormously popular "De Camptown Races" (1850), but the best of his negro songs contain something vitally distinctive. In them, to quote his competent biographer H. V. Milligan, "the negro ceases to be a caricature and becomes a human being. . . . In this type of song, universal in the appeal of its naïve pathos, he has never had an equal. . . . This is not the negro of 'Jump Jim Crow' and 'Zip Coon' but of *Uncle Tom's Cabin*."

By 1850 the popularity of his songs prompted Foster to derive a living from professional song-writing. During the next four years his vogue spread with incredible rapidity, but also by then he had practically sung his song, though half of his 175 compositions, generally to his own words, were yet to come. They yielded substantial royalties, but after 1860 Foster apparently preferred to sell his songs outright for a few dollars. This trapped him into song-factory methods; for instance, almost all of his 40 odd compositions of 1863 are pot-boilers. Most of his songs merely humoured the market and became historically negligible. Among the exceptions, however, the following possess the power and function of imperishable American folk-songs: "Uncle Ned" (1848), "Nelly Bly" (1849), "Swanee River" or "The Old Folks at Home" (1851), "Massa's in the cold, cold ground" (1852), "My Old Kentucky Home" (1853), "Old Dog Tray" (1853) and "Old Black Joe" (1860). (O. G. So.)

FOSTORIA, a city of northern Ohio, U.S.A., 35m. S. by E. of Toledo, in Seneca and Hancock counties. It is on Federal highway 23, and is well served by the Baltimore and Ohio, the Hocking Valley, the New York Central and Electric railways. The population was 9,987 in 1920 (94% native white) and was 12,790 in 1930 by the Federal census. It is in a rich agricultural and oil-producing region, and has a variety of important manufacturing industries. In 1832 two towns, Rome and Risdon, were founded on the site. After a period of bitter rivalry they were merged, and the city (chartered in 1854) was named after Charles W. Foster, whose son, Charles Foster (1828–1904), was governor of the State, 1880–84, and secretary of the Treasury, 1891–93.

FOTHERGILL, JOHN (1712–1780), English physician, was born of a Quaker family on March 8, 1712, at Carr End in Yorkshire. His pamphlet entitled "Account of the Sore Throat attended with Ulcers" (1748) contains one of the first descriptions of diphtheria in English, and was translated into several languages. He died in London on Dec. 26, 1780.

FOTHERINGHAY, a village of Northamptonshire, England, picturesquely situated on the left bank of the river Nen, $3\frac{1}{2}$ m. N.N.E. of Oundle. Pop. of civil parish (1921) 208. The castle, of which nothing but the earthworks and foundations remain, is famous as the scene of the imprisonment of Mary Queen of Scots from September 1586 to her trial and execution on Feb. 8, 1587. The earthworks, commanding a ford of the river, are apparently of very early date, and probably bore a castle from Norman times. It became an important stronghold of the Plantagenets from the time of Edward III., and was the birthplace of Richard III. in 1452. The church of St. Mary and All Saints, originally collegiate, is Perpendicular; the nave with aisles, and the tower surmounted by an octagon, are in the best style of the period. Of the Plantagenets, Edward, second duke of York, who was killed at the battle of Agincourt in 1415, Richard, the third duke, and his duchess, Cecily (d. 1495), also his son the earl of Rutland, who with Richard himself, fell at the battle of Wakefield in 1460, are buried in the church. Their monuments were erected by Queen Elizabeth, who found the choir and tombs in ruins.

FOUCAULT, JEAN BERNARD LÉON (1819–1868), French physicist, was the son of a publisher at Paris, where he was born on Sept. 18, 1819. After studying medicine he became interested in experimental physics. With A. H. L. Fizeau (*q.v.*) he carried on a series of investigations in light and heat. By the use of a revolving mirror, similar to that used by Sir Charles Wheatstone for measuring the rapidity of electric currents, he was able in 1850 to establish that the velocity of light in different media varies inversely as the refractive indices of the media, and later to measure the velocity of light in air.

For his demonstration in 1851 of the diurnal motion of the earth by the rotation of the plane of oscillation of a freely suspended, long, heavy pendulum, and for his invention of the gyroscope, he received the Copley medal of the Royal Society in 1855, and in the same year he was made physical assistant in the imperial observatory at Paris. He discovered the existence of eddy or "Foucault currents" induced in a copper disc moving in a strong magnetic field. Foucault invented the polarizer which bears his name, and devised a method of giving to the speculum of reflecting telescopes the form of a spheroid or a paraboloid of revolution. He also introduced improvements in the electric arc.

Foucault received many honours during his life; he died of paralysis on Feb. 11, 1868 at Paris. From the year 1845 he edited the scientific portion of the *Journal des Débats*. His chief scientific papers are to be found in the *Comptes Rendus*, 1847–69.

See *Revue cours scient.* vi. (1869), pp. 484–489; *Proc. Roy. Soc.* xvii. (1869), pp. lxxiii.–lxxiv.; Lissajous, *Notice historique sur la vie et les travaux de Léon Foucault* (1875); P. Gilbert *Léon Foucault, sa vie et son oeuvre scientifique* (Brussels 1879).

FOUCHÉ, JOSEPH, DUKE OF OTRANTO (1763–1820), French statesman, was born near Nantes on May 21, 1763. He was educated by the Oratorians at Nantes, and in Paris, and afterwards taught in various schools. At Arras he had some dealings with Robespierre in 1789.

In Oct. 1790 he was transferred by the Oratorians to their college at Nantes, where he became a leading member of the local Jacobin club; and on the dissolution of the college in May 1792, Fouché gave up all connection with the church, whose major vows he had not taken. In Aug. 1792 he was elected as deputy for the department of the Lower Loire to the National Convention. His sympathy with the Girondists soon gave way to an enthusiasm for the more violent doctrines of the Jacobins. After some preliminary hesitations, he demanded the immediate execution of Louis XVI. and denounced those who "wavered before the shadow of a king."

The crisis which resulted from the declaration of war by the Convention against England and Holland (Feb. 1, 1793), and a little later against Spain, brought Fouché into notoriety as one of the fiercest of the Jacobins. The Convention deputed Fouché with a colleague, Villers, to proceed to the west as commissioners for the crushing of the revolt of "the whites" in La Vendée. He soon held the post of commissioner of the republic in the department of the Nièvre. With Chaumette, he helped to initiate the atheistical movement, which in the autumn of 1793 aimed at the extinction of Christianity in France. In the Nièvre he ransacked the churches, sent their spoils to the treasury and established the cult of the goddess of Reason.

Fouché then proceeded to Lyons with Collot d'Herbois (*q.v.*) to execute the vengeance of the Convention on that city, which had revolted against the Jacobins. Toward the end of the Lyons terror Fouché exercised a moderating influence, though outwardly his conduct was marked by the utmost rigour. By that time Robespierre had struck down the other leaders of the atheistical party; but early in June 1794, at the time of the "Festival of the Supreme Being," Fouché ventured to mock at the theistic revival which Robespierre then inaugurated, and Robespierre procured his ejection from the Jacobin club (July 14, 1794). Fouché, however, was working with his customary skill and energy, and with Tallien and others, effected the overthrow of Robespierre on Thermidor 10 (July 28), 1794. In the intrigues which followed, a vigorous attack on him by Boissy d'Anglas, on Aug. 9, 1795, caused his arrest, but he was released by the amnesty which was passed on the proclamation of the new constitution of 1795.

Under the Directory (1795–1799), Fouché established contact with the communists, once headed by Chaumette and now by François N. ("Gracchus") Babeuf (*q.v.*); whether he betrayed to the director Barras the secret of the Babeuf plot of 1796 is uncertain. In 1797 he gained an appointment for the supply of military matériel. After offering his services to the royalists, whose movement was then gathering force, he again decided to support the Jacobins and the director Barras (*q.v.*). In the *coup d'état* of Fructidor 1797 he made himself useful to Barras, who in 1798 appointed him to be French ambassador to the Cisalpine republic. At Milan he carried matters with so high a hand that he was removed. Early in 1799 he returned to Paris, and after serving as ambassador at The Hague, he became minister of police at Paris (July 20, 1799). The newly elected director, Sieyès (*q.v.*), desired to repress the Jacobins, who had recently reopened their club. Fouché closed the Jacobin club and hunted down the pamphleteers and editors, whether Jacobins or royalists, who were obnoxious to the government, so that at the time of the return of Bonaparte from Egypt (October 1799) the ex-Jacobin was one of the most powerful men in France.

Fouché now lent himself to the schemes of Bonaparte and Sieyès for their overthrow of the directors, and furthered the *coup d'état* of Brumaire 18–19 (Nov. 9–10), 1799. During the Consulate (1799–1804) Fouché was careful to temper as far as possible the arbitrary actions of Bonaparte. In this difficult task he acquitted himself with so much skill as to earn at times the gratitude even of the royalists, and he tried to save the Jacobins from the vengeance of the First Consul, especially in the "Plot of the Placards" in the spring of 1802. In any case Bonaparte resolved to rid himself of a subordinate who had too much power and skill in intrigue. On the proclamation of Bonaparte as First Consul for life (Aug. 1, 1802) Fouché was deprived of his office; the ministry of police was suppressed, and most of its duties

handed over to an extended ministry of justice. Fouché became a senator, and received half of the reserve funds of the police which had accumulated during his tenure of office. The information gained by his spies was so valuable to Napoleon at the time of the Cadoudal-Pichegru conspiracy (February–March 1804), that he now brought back Fouché to the re-constituted ministry of police (July 1804). Fouché later on became minister of the interior. His police agents were ubiquitous, and the terror which Napoleon and Fouché inspired, partly accounts for the absence of conspiracies after 1804. After Austerlitz (Dec. 1805) Fouché uttered the *mot* of the occasion: "Sire, Austerlitz has shattered the old aristocracy; the boulevard St. Germain no longer conspires."

While engaged in the campaign of Spain, the emperor heard rumours that Fouché and Talleyrand, once bitter enemies, were having interviews at Paris in which Murat, king of Naples, was concerned. Napoleon hurried to Paris, but found nothing to incriminate Fouché, who now became duke of Otranto. During the absence of Napoleon in Austria in the campaign of 1809, the British Walcheren expedition threatened for a time the safety of Antwerp. Fouché thereupon issued an order to the prefects of the northern departments of the empire for the mobilization of 60,000 National Guards, in which he gave offence by the words: "Let us prove to Europe that although the genius of Napoleon can throw lustre on France, his presence is not necessary to enable us to repulse the enemy." The next months brought further causes of friction between emperor and minister. Napoleon found that Fouché had forestalled him in making overtures for peace to the British ministry in 1809. Fouché was dismissed (June 3, 1810), but was made governor of Rome. Hearing of the emperor's anger at his refusal to give up certain documents of his former ministry, he prepared, soon after his arrival at Florence, to sail for the United States. But he found a mediator in Elisa Bonaparte, grand duchess of Tuscany, and was allowed to settle at Aix and finally to return to his domain at Point Carré. In 1812 he sought vainly to dissuade Napoleon from invading Russia; and on the return of the emperor to Paris at the close of that year, Fouché was suspected of complicity in the conspiracy of General Malet. From this suspicion he cleared himself and Napoleon sent him to administer the Illyrian provinces. On the break-up of the Napoleonic system in Oct. 1813 Fouché was ordered to Naples, to watch the movements of Murat. Before he arrived at Naples Murat threw off the mask and invaded Roman territory. Fouché returned to Paris on April 10, 1814, when Napoleon was being constrained by his marshals to abdicate.

At this crisis Fouché tried to gain favour with the new régime without compromising himself too deeply. When he found that there were no hopes of advancement, he entered into relations with Lafayette and Davout. Shortly before the return of Napoleon to Paris (March 19, 1815) Louis XVIII. offered Fouché the ministry of police, which he declined, saying, "It is too late; the only plan to adopt is to retreat." On the arrival of Napoleon he received for the third time the portfolio of police. Nevertheless he entered into secret relations with Metternich at Vienna, his aim being, as always, to prepare for all eventualities. Meanwhile he used all his powers to induce the emperor to popularise his rule, and is said to have caused the insertion of the words "The sovereignty resides in the people; it is the source of power" in the declaration of the council of state. On June 22 Napoleon abdicated for the second time, and Fouché was elected president of the commission which provisionally governed France. Already he was in touch with Louis XVIII., then at Ghent. While ostensibly working for the recognition of the duc de Reichstadt, he facilitated the success of the Bourbon cause. But he could not conciliate royalists who remembered his vote as regicide and his terrorist record. He resigned office, and after acting for a time as ambassador at Dresden, he retired to Prague. Finally he settled at Trieste, where he died on Dec. 25, 1820. He had accumulated great wealth.

In Fouché the enthusiasm of the revolutionary period appeared as a cold, selfish and remorseless fanaticism; in him the bureaucracy of the period 1795–1799 and the autocracy of Napoleon found their ablest instrument. Yet he was never a mere tool. He

multiplied the means of resistance even to Napoleon, so that though removed from office, he was never wholly disgraced. While appearing to be the servant of the victors, present or prospective, he never gave himself to any one party. In this versatility he resembles Talleyrand, of whom he was a coarse replica. Both professed, under all their shifts and turns, to be desirous of serving France. Talleyrand certainly did so in the sphere of diplomacy; Fouché may occasionally have done so in the sphere of intrigue.

BIBLIOGRAPHY.—Fouché wrote some political pamphlets and reports, the chief of which are *Réflexions sur le jugement de Louis Capet* (1793); *Réflexions sur l'éducation publique* (1793); *Rapport et projet de loi relatif aux collèges* (1793); *Rapport sur la situation de Commune-Affranchie* [Lyons] (1794); *Lettre aux préfets concernant les prêtres*, etc. (1801); also the letters of 1815 noted above, and a *Lettre au duc de Wellington* (1817). The best life of Fouché is that by L. Madelin, *Fouché* (2 vols., 1901). The so-called *Fouché Mémoires* are not genuine, but they were apparently compiled, at least in part, from notes written by Fouché, and are often valuable, though their account of events (e.g. of the negotiations of 1809–1810) is not seldom untrustworthy. For those negotiations see Coquelle, *Napoléon et l'Angleterre* (1903, Eng. trans., 1904). For the plots with which Fouché had to deal see E. Daudet, *La Police et les Chouans sous le Consulat et l'Empire* (1895); P. M. C. Desmarest, *Témoignages historiques, ou quinze ans de haute police* (1833, 2nd ed., 1900); E. Picard, *Bonaparte et Moreau* (1905); G. A. Thierry, *Conspirateurs et gens de police; le complot de libelles* (1903, Eng. trans., 1903); H. Welschinger, *Le Duc d'Enghien* (1888); E. Guillon, *Les Complots militaires sous le Consulat et l'Empire* (1894); and d'Hauterive, *La police secrète du premier Empire* (1908).

FOUGÈRES, town of north-western France, capital of an arrondissement in the department of Ille-et-Vilaine, 30 m. N.E. of Rennes by rail. Pop. (1926) 20,407. Fougères frequently figures in Breton history from the 11th to the 15th century. It was taken by the English in 1166, and again in 1448. In 1488 it was taken by the troops of Charles VIII. In the middle ages Fougères was a lordship of some importance, which in the 13th century passed into the possession of the family of Lusignan, and in 1307 was confiscated by the crown and afterwards changed hands many times. In 1793, during the wars of the Vendée, it was occupied by the insurgents. It was formerly on the frontier towards Normandy, and of its mediaeval fortifications, the 15th century Porte St. Sulpice still exists. The castle, situated in the lower part of the town, overlooking the Nançon, is now in ruins, but its ruined towers and outworks give evidence of its strength. The finest of the towers was erected in 1242 by Hugues de Lusignan, and named after Mélusine, the mythical foundress of the family. The churches of St. Léonard and St. Sulpice both date, partly at least, from the 15th century. An hôtel de ville and a belfry, both of the 15th century, are of architectural interest, and the town possesses many curious old houses. Fougères is the seat of a subprefect, and has a tribunal of first instance, a chamber of commerce. It manufactures boots and shoes; tanning and leather-dressing and the manufacture of sail-cloth and other fabrics are also important. Trade is in butter and salted goods and in the granite of the neighbouring quarries.

FOUILLÉE, ALFRED JULES EMILE (1838–1912), French philosopher, was born at La Pouéze on Oct. 18, 1838. From 1864 he was successively professor of philosophy at the lycées of Douai, Montpellier and Bordeaux, and from 1872 to 1875 at the École Normale. Great success attended his early works *La Philosophie de Platon* (1869), *La Philosophie de Sarate* (1874), *Hist. de la Phil.* (1875) and *La Liberté et le déterminisme* (1883). Fouillée's philosophy is a speculative eclecticism. He endeavours to reconcile metaphysical idealism with the naturalistic and mechanical standpoint of science by means of his *idées-forces*. In *L'Évolutionnisme des idées-forces* (1890), *La Psychologie des idées-forces* (1893), and *La Morale des idées-forces* (1907), he elaborates his doctrine of *idées-forces*, or of mind as efficient cause through the tendency of ideas to realize themselves in appropriate movement.

See A. Guyan, *La Phil. et la Sociol. d'A. Fouillée* (1913).

FOULARD. A light silk fabric, having a distinctive soft finish and of the plain or simple twill weave. It is said to come originally from the Far East. In French, the word "foulard" signifies a silk handkerchief. The fabric is figured with a pattern printed in various colours, and used for dress material, handker-

chiefs, scarves and neckties. Fine cotton textures of good quality and produced from yarn spun from superior grades of cotton (as Egyptian and Sea Islands), are also sold as "foulard." Cotton foulard, which is usually of the plain calico or simple twill weave, is mercerized, and printed with patterns in styles and colourings similar to those of silk foulard, and employed for similar purposes.

FOULD, ACHILLE (1800-1867), French banker and politician, was born in Paris on Nov. 17, 1800. He belonged to a Jewish family of bankers, and as minister of finance under Louis Napoleon (as president and as Napoleon III.), from 1849 to 1852, and again from 1861 to 1867, carried out important financial and administrative reforms. He died in Tarbes on Oct. 5, 1867.

FOULGNES DE NEUILLY (d. 1202), crusade preacher, was born at Neuilly, and after a dissolute life and a sudden conversion, went to Paris to study. There he began to preach about 1195, and later acquired fame by his eloquence in Normandy, Burgundy and Picardy. He declared that he had persuaded over 200,000 men to go on the fourth crusade. When his success began to decline, he retired to his native town, where he died in March 1202.

FOULIS, ANDREW (1712-1775) and **ROBERT** (1707-1776), Scottish printers and publishers, were the sons of a Glasgow maltman. Robert was apprenticed to a barber; but his ability attracted the attention of Dr. Francis Hutcheson, who strongly recommended him to establish a printing press. He started business in 1741 in Glasgow, and in 1743 was appointed printer to the university. In this same year he brought out *Demetrius Phalereus de elocutione*, in Greek and Latin, the first Greek book ever printed in Glasgow; and this was followed in 1774 by the famous 12mo edition of Horace which was long believed to be immaculate: though the successive sheets were exposed in the university and a reward offered for the discovery of any inaccuracy, six errors at least, according to T. F. Dibdin, escaped detection. Soon afterwards Robert went into partnership with Andrew, who had been educated for the church, and they continued for about thirty years to issue carefully corrected and beautifully printed editions of classical works in Latin, Greek, English, French and Italian. They printed more than five hundred separate publications, among them the small editions of Cicero, Tacitus, Cornelius Nepos, Virgil, Tibullus and Propertius, Lucretius and Juvenal; a beautiful edition of the Greek Testament, in small 4to; Homer (4 vols. fol., 1756-58); Herodotus, Greek and Latin (9 vols. 12mo, 1761); Xenophon, Greek and Latin (12 vols. 12mo, 1762-67); Gray's poems; Pope's works; Milton's poems. The Homer, for which Flaxman's designs were executed, is perhaps the most famous production of the Foulis press. The brothers spared no pains, and Robert went to France to procure manuscripts of the classics, and to engage a skilled engraver and a copper-plate printer. Unfortunately it became their ambition to establish an institution for the encouragement of the fine arts. Their countrymen were not ripe for such an attempt, and the "Academy" involved the projectors in ruin. Andrew died on Sept. 18, 1775, and Robert on June 2, 1776. Robert was the author of a *Catalogue of Paintings with Critical Remarks*. The business was afterwards carried on under the same name by Robert's son Andrew.

See W. J. Duncan, *Notices and Documents illustrative of the Literary History of Glasgow*, printed for the Maitland Club (1831), which *inter alia* contains a catalogue of the works printed at the Foulis press, and another of the pictures, statues and busts in plaster of Paris produced at the "Academy" in the University of Glasgow. See also J. Ferguson, *The Brothers Foulis and early Glasgow Printing* (1889); D. Murray, *Robert and Andrew Foulis and the Glasgow Press* (Glasgow, 1913); *Letters of Robert Foulis* (Glasgow, 1917).

FOULLON, JOSEPH FRANÇOIS (1717-1789), French administrator, was born at Saumur. During the Seven Years' War he was intendant-general of the armies, and intendant of the army and navy under Marshal de Belle-Isle. In 1771 he was appointed intendant of finances. The farmers-general detested him on account of his severity, the Parisians on account of his wealth; he was reported, probably quite without foundation, to have said, "If the people cannot get bread, let them eat hay." After the fall of the Bastille in 1789 he fled from Paris, but was seized,

brought to the hôtel de ville, and, in spite of the intervention of Lafayette, was dragged out by the people and hanged to a lamp-post on July 22, 1789.

See Eugène Bonnemère, *Histoire des paysans* (4th ed., 1887), tome iii.; C. L. Chassin, *Les Élections et les cahiers de Paris en 1789* (Paris, 1889), tomes iii. and iv.

FOUNDATION, the act of building, or instituting on a permanent basis, the establishing of any institution by endowing it with funds for its continual maintenance, and hence the institutions so established. The terms "on the foundation," or "foundationer," are used of members of a college or society who enjoy, as fellows, scholars, etc., the benefits of the endowment. Formerly "foundation" also meant the charter or incorporation of any such institution or society, and it is still applied to the funds used for their endowment. (See PHILANTHROPIC ENDOWMENTS.)

The terms "old foundation" and "new foundation" used of English cathedral chapters have no reference to the age of the cathedrals (see CATHEDRAL.)

"Foundation" also means the base (natural or artificial) on which any erection is built, generally made below the level of the ground (see FOUNDATIONS). A foundation-stone is one of the stones at the base of a building, generally a corner-stone, frequently laid with a public ceremony. In gem-cutting the "foundation-square" is the first of eight squares round the edges of a brilliant made in bevel planes and from which the angles are all removed to form three-corner facets.

FOUNDATIONS, as referred to building and construction, is appropriately applied to all those portions of the structure below the footings of walls, piers and columns. Foundations are designed to transmit the weight of the superstructure to that portion of the earth's surface on which it rests and which may be called the *foundation bed*. Foundation beds vary in *bearing capacity*. All are compressible, hence the erection and loading of any superstructure is accompanied by settlement, though the amount for solid rock is negligible. The object of foundations is to transmit the entire load to the foundation bed at a safe pressure and with small and uniform settlement.

Foundation Beds.—Corresponding geological surface formations may show marked local variations, hence, though foundation beds may be scientifically classified, practical experience of a locality often decides the ultimate treatment.

Rock.—In some districts massive rock formations may occur near the surface, in others they may be exposed by excavation or otherwise reached. Massive rocks provide good foundation beds. Igneous rocks, dense limestones and sandstones can easily bear pressures of 15 tons per square foot, but on softer rocks the limit may be 8 tons. Many foundation beds are products of rock-disintegration; these include gravel, sand, clay, silt, etc.

Gravel.—Gravel consists of water-worn rock fragments varying much in size. Well-compacted gravel overlying a strong substratum, offers a dependable foundation bed which will support at least 4 tons per square foot.

Sand consists of fine rock particles, from $\frac{1}{4}$ in. downwards in diameter. Sand foundations need protection from running water, to prevent lateral escape. Confined sand may support from 2 to 4 tons per square foot.

Clay.—This term embraces cohesive soils, in which the characteristics vary with the composition. Pure clay contributes to plasticity, sand reduces it. Clay becomes plastic with moisture and changes in volume with plasticity; the moisture-content of clay should, therefore, be kept low and uniform; actual contact with water is to be avoided. Drainage of and diversion of water from the site are the usual precautions. Clay foundations need protection from seasonal variations of temperature and humidity; otherwise changes in volume may lead to structural fractures. Such foundations should be 3 to 4 ft. below ground. Bearing pressures on dry yellow clays are usually limited to 2 tons per square foot and on blue clays to 4 tons per square foot.

Made or Filled Ground; Silt.—Depressions and excavations are often filled artificially. "Filled" ground continues to consolidate over many years. Building over such ground requires excavation

or penetration of the filling to a solid bed, and sites with a soft overlying bed may be similarly treated. On low-lying soft ground, buildings may be "floated" on "rafts," i.e., timber or reinforced concrete slabs continuous over the site. Settlement is thus controlled and rendered uniform.

Other foundation beds may be mixtures of materials and will possess intermediate characteristics.

Protection of Foundation Beds.—Lateral support and protection are often required. Friable earths crumble on upright faces and soft rocks disintegrate. These may be protected by retention walls. Underlying streams of water should be enclosed in a culvert. Where "ground water" is freely rising and falling basements should be constructed as watertight tanks to resist external hydrostatic pressure and prevent the incursion of water.

Bearing Capacity.—Before planning the foundations of an important building an investigation of the site is usually necessary; experience of adjacent sites will assist the investigation. If examination of the underlying strata is found necessary a trial pit would be sunk, or "boring" adopted, and samples of the strata raised to the surface and examined.

Allowable bearing capacities for foundation beds in any one locality are often scheduled as in the London Steel Framed Build-

FROM ROOLE AND KINNE, "FOUNDATIONS" (MCGRAW-HILL.)

FIG. 1.—LOAD-TESTING APPARATUS FOR FOUNDATION SOILS

ings Act of 1909. Many American building codes include similar schedules. In doubtful cases experiments may have to be employed to determine the bearing capacity.

British regulations do not impose bearing tests, but the Building Code of New York City details a test to be conducted on a minimum area of 4 sq. ft. and after four days 50% more pressure than the proposed bearing capacity must not produce settlement. Fig. 1 shows the apparatus designed for this test by the American Society of Civil Engineers.

Loads Carried.—The constant load is the weight of the structure; its magnitude and distribution are readily determinable.

The movable load fluctuates with occupancy and use, with wind-pressure and snow, and varies from zero to a maximum value. It is difficult to estimate designing loads on foundations but usually when the movable load forms a substantial part of the possible foundation load, the foundations may be designed to carry about 60% of the sum of the loads for which the structural units have been designed. This percentage is specified, with qualifications, for certain types of American buildings.

Types of Foundations.

There are two general classes: (a) *spread foundations*, constructed near the surface and having a base area proportional to the load; and (b) *deep foundations*, excavated or driven to considerable depth, the horizontal area occupied having little relation to the load carried. Cement concrete (see CONCRETE) is used almost universally for foundations. It is strong and conforms to the inaccuracies of the foundation bed.

Grillage Foundations.—Projections in foundation concrete may be reinforced with steel, the thickness being then reduced; or steel may be employed as the principal material. In the latter type, steel beams are used to form a "grillage" in two or more tiers. The load is transmitted through a steel or cast iron base to the tiers of the beams, which are bound together transversely by steel sections or by metal packings and bolts.

The foundation steelwork is bedded upon and encased in concrete.

Reinforced Concrete Foundations.—A foundation having the same function as the steel grillage is also shown in fig. 2. Reinforced concrete is employed (see REINFORCED CONCRETE).

Cantilevered Foundations.—When a large pillar occurs at a boundary adjoining an existing building, and an ordinary foundation is impossible, an external pillar is linked with an internal one by a heavy beam, having one end projecting as a cantilever. The outer foundation is well within the boundary. Load from the external pillar is transferred to the cantilever, which bears on the foundation and is balanced by the load on the internal pillar. The foundation is designed to exert uniform pressure on the bed when fully loaded.

In another method two pillars may have a common foundation. The base may be parallel or trapezoidal, and so arranged that the resultant of the two loads lies over the centre of gravity of the base. The trapezoidal base is more suitable for reinforced concrete construction. (See also STRUCTURAL ENGINEERING.)

Stepped Foundations.—Changes in foundation level should be made in small "steps" to avoid (a) the diagonal shearing of the foundation bed between levels; and (b) fracture at the vertical junction of the higher and lower sections. The concrete bed should be stepped and made continuous by vertical "ramps."

Deep Foundations.—Extensive foundation beds, otherwise good, may reveal soft pockets, which can be bridged over by beams or arches. Foundations on soft strata or filled material may be supported on brick or concrete piers erected in deep excavations, on a firm bed. The piers are connected by arches or beams.

Pile Foundations.—A stout pillar of any material driven into the ground is known as a pile. It is generally more economical to use piles than piers, and they may be of round timber, or of square timber shod and banded with iron. Piles may be driven by mechanical devices worked either by man or steam power. Steam hammers for rapid driving, give light and quick blows, so reducing damage to the head of the pile. Piles are conveniently grouped

FIG. 2.—SPECIAL FOUNDATIONS (A) Compound steel grillage foundation, parallel base; (B) Compound reinforced concrete foundation, trapezoidal base. These methods are applicable where projection beyond the external pillar (A) is strictly limited

to support concentrated loads as at bridge abutments, or under columns in a building. They may be driven until either (a) their points are embedded in a firm substratum (*bearing piles*), or (b) the friction on their sides is sufficient to provide resistance (*friction piles*). To distribute the load, timber frames or masses of concrete are laid on the piles.

Concrete Piles.—Concrete piles are mainly of two kinds, viz. (a) *pre-cast* and (b) *cast in-situ*. The former have vertical steel bars, bent in at the point, hooped transversely and diagonally and enveloped in concrete. Reinforcement adds to the compressional strength and provides resistance to end blows and to possible side bending when driving. The points are shod with steel or cast iron. Modern rapid-hardening cement permits of moulding and driving in a few days. The "cast in-situ" piles have marked advantages over those pre-cast; space for moulding is not required, work is rapid and piles can be loaded soon after driving. This type may be classified into (a) systems in which a tapered tube is driven, withdrawn, and the space filled with concrete, or in which a mandrel and sheath are driven, the mandrel being withdrawn and the sheath left and filled with concrete; (b) systems in which a parallel tube, shod with solid metal, is driven, the tube being gradually withdrawn and concrete poured to fill the hole and enclosing a frame of reinforcement if desired; (c) systems designed for enlarged bases to increase the load capacity; and (d) systems in which tubes are sunk into the ground, the earth withdrawn from the inside, and the tubes filled with concrete. In one patent form, the tube employed is vibrated on withdrawal to assist the consolidation of the concrete.

The supporting power of piles is a difficult and controversial subject and cannot be included here.

Special Foundations.—Exceptional forms of foundation occur in large and heavy structures, bridge piers, dock walls and harbour work, in which large excavations may cover an entire building site. The vertical sides of the cutting must usually be maintained by temporary supports provided by shoring (*see SHORING*).

Deep Foundations for Piers.—Timber is usually employed to strut the sides of deep excavations for piers, the timber being inserted in short stages. In the U.S.A. a circular excavation is often made and the sides supported by short vertical poling boards wedged against cast iron circular frames.

The Open Caisson.—Danger to property may occur if adjacent excavations cause withdrawal of running sand, hence for excavations through wet strata, water and fine sand must be kept out of the cutting. In vertical shafts the sides may be supported by steel or concrete linings added in short lengths at the top, as the excavation proceeds. An enlarged base is usually formed to increase the bearing area; and the lining is filled with concrete upon which the surface foundation is laid.

The Pneumatic Caisson.—For preventing the incursion of water to excavations in wet strata and in river beds, the pneumatic caisson is employed, this being a cylinder of steel or reinforced concrete of the same size as the foundation. The caisson is a rigid casing without base and having cutting edges. Units are added above water level as the caisson sinks. A working chamber is formed in the base, isolated by an "air-lock." The men work in compressed air, which must resist the incursion of water. To admit and withdraw men and materials the air-lock chamber has two doors at different levels. The air pressure is maintained by re-sealing one door before opening the other; at the required depth the space of the working chamber is sealed with concrete. Steel caissons are usually filled or lined with concrete, and reinforced concrete shells are bridged over to receive the superstructure.

Sheet Piling.—One function of sheet piling is to support laterally foundation beds which would spread under pressure; sites are occasionally *surrounded* by sheet piling. It also gives continuous support to very soft ground, as in water-bearing strata, where shallow excavations and conditions do not make a closed caisson imperative. For much ordinary work timber sheet piles are used, driven between horizontal walings secured to square guide piles. Sheet piles formed by special sections of rolled steel are in common use, and various forms of reinforced concrete

sheet pile are also employed.

A patented type of reinforced square pile has two wings. Driven edge to edge these piles may be used as sheeting or for retaining "made" earth, assisted by reinforced ties anchored to the earth behind the wall. The piles are designed to resist the consequent bending moments. Sheet piles have the feet splayed to induce the entering pile to close against the edge of its neighbour.

The Coffor Dam is a substantial temporary dam, used where the hydrostatic head is considerable and simple sheet piling is inadequate. A coffer dam may surround an enclosure for the removal of water and soil and the insertion of a foundation or, for quay walls, may be on the water side only. In modern practice two rows of close piling are used, 5 ft. and upwards apart, driven to impervious ground. The space within the piles is cleared and filled with puddled clay. On completion the water is pumped from the enclosure and excavation or construction may proceed. For deep interior excavation after withdrawal of water the coffer dam is supported by transverse strutting or by inclined shoring.

PROTECTION OF ADJOINING STRUCTURES

When inserting foundations for new buildings the foundations of adjoining structures must not be disturbed. Most laws recognize the rights of adjoining owners, and impose penalties for damages to existing property. The upper portions of existing structures must be supported by shoring while adjacent excavations are in progress (*see SHORING*).

If the new foundations are to be lower, to admit of deeper basements, then the old structure must be re-supported at the lower level. The process of inserting new supports is known as under-pinning.

Under-pinning.—The problem in under-pinning is to place solid supports underneath the old foundations and to avoid settlement of the existing building in the process. Methods of under-pinning cannot be standardized; fig. 3 shows one method in which short lengths of foundation are exposed by pits sunk to the new level. In heavy structures, dead shoring is required which consists of "needles" passed beneath the foundations and supported on short uprights or from the adjacent ground. The excavations are then extended and *portions* of the new foundations

FIG. 4.—USUAL METHOD OF UNDERPINNING OLD FOUNDATIONS

erected. For brickwork, cement mortar is used and the last joint wedged with slate. If in concrete the top clearance is grouted solid with cement. When the new work may receive load the intervening portions of foundation are inserted. For small buildings, on firm ground, under-pinning can sometimes be done without temporary support.

Pre-test Piles.—A method of pile under-pinning has been patented in America (1917) and in England known as "pre-test" piling. Pre-test piles may also be used for new buildings. For the purpose of under-pinning, short lengths of the old foundations

are exposed to allow of the insertion of a short length of steel tube, 14 in. to 20 in. diameter and $\frac{3}{8}$ in. thick, which becomes the casing to a complete pile—afterwards concrete filled. The short tube is forced into the ground by a pair of powerful hydraulic jacks operated by a force pump working at high pressure. The tube is cleared of earth by grabbing or otherwise. Another length is added and the process repeated, additions being made by sleeve-

FIG. 5.—THE PRE-TEST METHOD OF UNDERPINNING, DEVELOPED AND PATENTED IN THE UNITED STATES OF AMERICA

jointed sections until the hard substratum is reached. The interior of the steel tube is filled with concrete and the pile completed. In the space between the old foundation and the head of the pile, a steel joist packing is inserted and wedged tight while two jacks keep the full load on the pile (see fig. 4).

By wedging tight while the pressure is maintained on the pile, a great advantage in supporting power is gained. When the pressure on such a pile is being increased, a "bulb of pressure" develops in the earth beneath the base of the pile and opposes its further penetration. If the load be released this "bulb" disappears and will only be re-formed if the pile be once more forced forward into the ground. Hence, if the underpinning be completed while the pile is *not* under pressure, the full resistance can only be developed by further settlement. The pre-test method eliminates this settlement and may also ensure a known factor of safety, since the jacks can be made to develop a definite and known thrust. Care is required in packing the bearings of the jacks on the concrete both of the pile and the old foundation and in wedging up the new support to avoid local damage to the concrete. The steel support and the heads of the piles are finally encased in concrete.

FOUNDERS' SHARES, a class of British joint stock company shares once not uncommon but now almost unknown. Founders' shares were created by company promoters who desired to retain in their hands a considerable part of the profits of a company which they floated. They effected this purpose by issuing to themselves or their friends or nominees a limited class of shares termed founders' shares, usually of small face value, which were to receive the entire profits of the company after the payment of certain fixed rates of profit upon the shares subscribed for by the public. In many cases such founders' shares became exceedingly valuable. The practice fell into bad repute, and accordingly ceased. But after the World War a practice arose of promoting British joint stock companies with capital divided into Ordinary or Preference shares of £1 each, and Deferred shares of one shilling each. When each share in such a company possesses one vote, when the deferred shares receive all the profits after a certain fixed rate on the £1 shares, and when the promoter or vendor allots to himself the greater part of the deferred shares a position obtains in which the public subscribes the greater part of the capital, while the promoter or vendor gets the control of the

business and the greater part of its profits. In such a case, the deferred shilling share becomes nothing more or less than the old and discredited founders' share.

FOUNDING. In a broad sense, the art of founding may be described as making a hole in sand and filling it with fluid metal. In the cold state the metal retains the shape and contour of the hole and is to that extent a metal casting. The art of founding is practised in foundries for the production of castings in all the commercial metals and alloys, and the two main stages are (1) the melting to fluidity of the metal or alloy and (2) the making of a container or mould of the form required in the final casting.

The Mould.—The material from which the mould is formed must be sufficiently infusible to resist the temperature of the metal or alloy entering the mould, a condition which is fulfilled by the use of sands selected according to their heat-resisting properties.

Apart from range of temperature the general principles involved in the production of castings are common to all types of alloys and metals. A mould may be regarded as a receptacle to be filled with a hot fluid. Of necessity, the material of the mould must retain its form and remain unaffected by the heat and washing action of the fluid and, while retaining it, must be sufficiently porous to allow the air displaced and also any gases evolved to escape freely. A trapped air or gas bubble would result in a cavity and, according to the extent of such trapping, would militate against the soundness or solidity of the cold casting. Any disturbance of the surface of the mould by the washing action of the stream will result in the disturbed material being trapped within the casting and in the cold state will show as dirt and disfigurement.

In common with all hot liquids, molten metals used in founding lessen in volume during cooling; this liquid shrinkage is naturally more pronounced in the heavier castings, and it is met by keeping, at the highest parts of the casting, channels open for the supply of extra fluid to replace the shrinkage below. These open channels or feeding heads are continually fed with fluid metal until the casting has solidified. After solidification the law common to all hot bodies comes into play and the cooling casting contracts with the falling temperature. The various metals and alloys have differing contraction coefficients, but these are known and are therefore allowed for by making the mould larger in volume to that extent.

The features thus outlined represent the metallurgical side of founding and must be fully met in the production of sound and true castings.

Pattern-making.—The making of the mould requires a model or pattern of the casting desired. Pattern-making has a close relation to the making of the mould and for economical production the pattern should be so built as to facilitate moulding. This will be realized by imagining the hole mentioned as entirely closed by the surrounding sand. In other words the pattern must be withdrawn from the sand without destroying the form imparted to it. As an example: if it is desired to reproduce a ball in metal, obviously that ball could not be completely surrounded with sand and withdrawn to leave a hole of the requisite form; but if the ball be sunk half way into sand contained in a box frame and a firm level joint made as shown in fig. 1, then a similar frame placed over the bottom one can, after ramming with sand, be lifted off without tearing the sand. The solid ball in the lower-half box can then be drawn clear and on replacing the top-half containing the top-half impression the resulting space will be that left by the solid ball. For convenience in moulding, a ball of this type would be divided through the centre; one half would be fitted with guide pins and the other with corresponding holes to ensure alignment when the two are together (fig. 2).

This division of patterns simplifies the moulding operation. In the present instance, one half-ball is laid on a flat board and the bottom moulding box placed in position; facing sand is sieved over the pattern, the box filled with riddled floor sand evenly rammed, and the whole turned over on to a level sand bed. In this position the mould joint is ready made and the top-half pattern is placed in position by means of the guide pins (fig. 2). The sand joint is dusted over with a parting medium of burnt sand

THE PROCESS OF MOULDING FROM SOLID PATTERN

This simplifies the operation of moulding. 3.—Section through complete mould. 4.—Multiple moulding boxes to suit contour of patterns. 5.—Top and bottom parts of moulding box with cross-bars to carry sand in boxes over 14 in. square. 6.—Pattern with loose pieces. These remain in sand on drawing main pattern and are then drawn horizontally until they clear overhanging sand. 7.—Pattern for fluted column. By dividing each half-pattern into three sections moulding is simplified. 8.—Square and round straight length core boxes built in sections to allow the removal of core when made. 9.—Core box with loose pieces. On removing one half-box the loose pieces remain and may be withdrawn laterally without breaking the sand. 10.—Elbow core box of irregular contour. 11.—Half mould flanged pipe ready for core. The core placed on two prints will leave a space as shown. 12.—Sweeping Spindle and socket. 13.—Sweeping mould for wheel. The formation of a mould by sweeping sand or loam. 14.—Swept spur wheel mould.

in order to ensure a clean separation at the joint and the stage shown in fig. 1 is reached. The top-half box is fitted with snugs drilled with holes corresponding to the upright pins of the lower box, these forming a guide for the later return of the top-half box. Facing sand is sieved over the pattern; a round feeding-peg is placed on the top of the pattern and a round runner-peg about 2" away from the pattern, and the top-half is then rammed with sand as is already the bottom. The sand is levelled off, the two pegs withdrawn and the top-half box lifted off bringing with it the top-half pattern. This half is turned over in order to draw the pattern. A small channel is cut in the bottom-half to form a gate from the bottom of the hole left by the runner-peg and to connect it to the pattern. The bottom-half pattern is drawn, any loose sand removed, and both half moulds dusted over with a carbonaceous facing. Fig. 3 shows a section through the closed mould when the top-half box has been replaced and the runner and feeding cups are in position. Before casting the top-half box is weighted down to prevent its being lifted by the pressure of the liquid metal.

This outline covers the making of a simple mould and it is now advisable to examine some of the features introduced.

Moulding Sands.—Suitable moulding sands are freely available and vary in colour from red and yellow to white. A properly moistened handful should, after squeezing, cohere and retain the shape imparted by the hand. The test of a moulding sand is that of retaining form when suitably pressed, and its coherence is due to the presence of clayey matter. Generally speaking the stronger

the sand the higher the content of clay; but there is a limit to the amount of clay permissible, for an excess destroys the essential feature of porosity. Natural sands have sufficient clayey matter present, but synthetic sand can be made from non-cohering material, such as river- or sea-sand, by bonding it with suitable clay mixture. The sharp sands may also be bonded by admixture with linseed oil, in which case the moulds are dried before casting.

The sand in contact with the pattern is termed "facing sand," that not in contact but used only as a backing and for filling up the moulding-box, "black" or "floor" sand. The former gives the desired appearance; the latter supplies the necessary rigidity and gives the mould a porous backing for the escape of gases. Black sands are simply the accumulation of used facing sands. All sands are worked in a moistened condition, but if too wet molten metal will not lie quietly on them. A ready test is that a ball of sand when squeezed should part cleanly from the hand; adhering sand indicates excess water. The term "green sand" indicates a mould cast in the condition as moulded, that is undried. The term "dry sand" is applied to moulds made precisely as green sand moulds but dried in a stove before casting.

The reason for the condition of air porosity in a moulding sand will be appreciated by one who tries to fill a gas-tight vessel with a stream of water the full size of a small aperture into it. Unless the displaced air can escape through the aperture a moment arises when a certain amount of water is ejected. In a sand mould filling with fluid metal the air within the mould, or any gases generated, must similarly find an egress; hence the necessity for

porousness, which is artificially increased by venting or pricking the sand with a wire to within a short distance of the pattern after ramming the mould.

Moulding Boxes.—Moulding boxes are essentially rigid frames, generally of cast iron, for carrying and supporting sand. In form they may be round, square, rectangular or, in special cases, of the contour of the patterns to be moulded in them. Sizes may range from a few inches square up to any extent within the crane lifting facilities of the foundry. Fig. 1 shows one half of a two-part moulding box; such a box will evidently offer only one joint, but some patterns may require two or more in order to draw them from the sand without tearing the mould. In such cases multiple boxes are used, and a typical "nest" is shown in fig. 4. Any number of units may be used and the depths of each unit made to suit the requirements of the pattern. Beyond a certain size, say 14 in.sq., it becomes necessary to introduce cross bars in the box in order to carry the sand; such a box is shown in fig. 5. The range in design is as wide as the variety of castings produced, and the general rule is to adapt the shape of the boxes to the contour of the patterns to be moulded.

The sphere of fig. 2, jointed in the centre, represents a clear draw; but there are cases where simple division is insufficient to ensure the clean withdrawal of each half pattern, and subdivision then becomes essential. Fig. 6 shows a type of recess met with in many castings. Owing to the taper a clean parting of solid pattern from sand would be impossible, so the pattern is made in three parts, the two loose pieces forming the inside taper being temporarily held in position by pegs as shown. The mould is made by placing the pattern flat side down on a turning-over board and laying the bottom half of the moulding box in position. The recess is rammed with sand; the pegs are withdrawn from the outer edge of the pattern, and the ramming completed; the bottom-half box is turned over on to a sand bed and the joint made; the top part with runner-pegs is rammed up and lifted off; runners are cut, and the main part of the pattern withdrawn, leaving the two loose strips remaining in the sand. The space provided by the removal of the pattern is sufficient to allow the strips to be drawn away horizontally until they clear the overhanging sand and can be removed vertically. Any projecting piece can be treated as a "loose piece," provided the space left after drawing the pattern is sufficient to admit of a side draw and then a straight lift for the removal of the loose piece.

The splitting of a cylinder into two halves would result in the same process of moulding as sketched in figs. 1 and 3. If the plain cylinder is replaced by a fluted column then a division of the pattern along its length would not give two halves admitting of clear drawing from the top and bottom boxes respectively. In such a case each half pattern would be split into three sections as shown in fig. 7. Moulding is carried to the stage of both half patterns being ready for drawing. On drawing the central part of each half pattern two side pieces remain in each half mould. These are removed in a direction suitable to the contour of the fluting so as not to break the sand forming the flutes. This method of pattern division is largely applied to ornamental and engineering castings.

Up to this point only the production of the external form of a casting has been considered; but in practice very few are solids, the majority having an internal form. This may be simply for lessening weight or, as is more usual, for some utilitarian purpose. The household kettle is a ready example of a casting in which the interior is required for service, and utility of the interior of a casting is well shown in the cylinders of a steam-engine or motor-car.

The "Core" to Form Internal Space.—As with externals so with internals; both are formed with sand shaped to desired contour; in the latter case the term "core" is used to denote that part of shaped sand forming an internal part of a casting. The requirements demanded from a "core" are that it shall resist the washing action of a stream of metal, admit of the free escape of gases, and impart the internal contour required. These fundamentals are intensified by the fact that in many cases the core may be almost wholly surrounded by molten metal, enhancing

the necessity of providing egress for the gases generated within. For this reason, and for the additional one of securing stability when handling, cores are dried in a stove before placing in the moulds.

Core boxes are built in sections in order to allow the removal of the core when made. The division of a round or square straight-length core box is shown in fig. 8. The two half boxes are fastened together, a strengthening piece of wire or iron rod placed in the centre, and core sand evenly rammed to the top. A hole is pierced through the length by means of a vent wire, the box unfastened, one half lifted off, and the core is ready for removal. As the core is "green" it will not admit of free handling, therefore on removal of the half box a layer of floor sand is spread evenly over the exposed half core and a level surface formed on which an iron plate is laid. The whole is turned over plate downwards and the remaining half box lifted away, leaving the core sitting in a sand bed. The plate is lifted into a drying stove, and the core when dry may be freely handled. The purpose of the strengthening wire or rod is evident, and the vent hole pierced through serves as a channel for the escape of gases when the core placed in the mould is surrounded by molten metal except at its two ends.

The principle of loose pieces applied to core boxes is shown in fig. 9. The core box is so built that on removing one half box the loose strips remain in the core and may be withdrawn laterally.

Cores may take a more or less curved form. A half core box for an elbow pipe is shown in fig. 10, and in this instance the method, though not the principle, of making the core will vary. Each half box is packed with sand and a strengthening iron bent to the required curve is bedded in one half. Both half boxes are strickled level and a coat of clay water pasted over the sand in each half to ensure sticking. Two strings are laid on one half so that their ends slightly overlap at the bent portion, the two half boxes brought together and tapped. The removal of the strings from each end of the box will leave a clear passage through the core. Instead of string flexible wax vents may be bent to the required contour and left in the core; on drying the wax is absorbed by the sand and a clear passage remains. With large cores the most effective channels are formed by "ash vents," which are made by ramming and strengthening as usual and then cutting central channels in the sand. The cut portions are filled with small coke and the core finished off as usual. With large cores this type of vent offers the most effective route for the escape of gases.

Patterns are provided with core prints and when the cores are placed in the resulting imprints alignment is assured. Taking a flanged pipe as an example the core prints remaining in the half mould are shown in fig. 11, and the core when laid in these prints will leave a space in the mould as shown by the dotted lines. If the top half of the mould be fitted on with the core in position then the closed mould will offer the requisite space for filling with fluid metal to give a replica of the pattern plus the desired central hole.

The principles underlying the art of founding have been indicated in their technical significance. As with all technical subjects, extension of principle is possible. While a complete pattern and core boxes are essential to economical production of standard castings elasticity is possible in the production of odd castings. Skeleton or outline patterns are used and the extra time taken in making a mould from a guide pattern is, in the case of a few castings only, balanced by the time saved in making a complete pattern.

Circular Castings.—These are made by scribing the circle of the diameter required on a prepared level sand bed and setting cores, made as a segment of the circle, to the circumference so marked. A flat top part will complete the mould. Carrying this a stage further, a mould may be formed by sweeping or "strickling" sand into required form. Sweeping is effected by means of a vertical spindle set in a level socket as in fig. 12; the rotation over a bed of rammed sand of a horizontal straight edge bolted to the vertical spindle will sweep a level surface. Applying this principle to the making of a mould for a wheel, the first stage will

FOUNDRY AND FURNACE METHODS IN THE MANUFACTURE OF CAST IRON PIPE

1. Blast furnaces and foundries at Pont-à-Mousson, France. Railway cars containing ore are unloaded at elevator (right) from which the ore is carried up inclined track to the mixing bins (left). Here it is mixed with limestone and coke and charged into the bell-topped blast furnaces (centre)
2. Pouring a section of 36" cast iron pipe: workman at left holds the long puddling shovel with which the molten iron is worked to attain the correct texture. Empty mould at right shows form of flange or rim of the pipe
3. Liquid iron being poured from large ladle, mounted on trucks, into smaller ladle from which it is poured into moulds (figs. 2 & 4)
4. Pouring cast iron into one of a series of large moulds for iron pipe. Mould at right has been filled and is cooling; escaping gases from the cooling metal pass off through porous sand and clay composing mould
5. Casting lengths of iron pipe by centrifugal process. The horizontal cylinders are filled with molten iron, then rotated to obtain an even consistency throughout length of pipe; mould is then chilled or hardened by water in a surrounding jacket. Flange of pipe seen at end
6. Annealing centrifugally cast pipe. After chilling (fig. 5) pipe is placed in the annealing furnace (centre) and heated for $\frac{1}{2}$ to $\frac{3}{4}$ hour at a temperature of 600° C. or more. This process strengthens the pipe and removes any strain caused by rapid cooling

be evident from fig. 13. The bracket carrying the sweeping board is removed and a core print with a central hole fitting the spindle is passed over the latter and bedded in position in the sand forming the bottom face. This gives a central print for the boss core, and the spindle and print are removed. The arms of the wheel are formed by dried sand cores which also give the inner walls of the rim and the outer walls of the boss. The cores are set in position by means of distance pieces cut to give rim and arm thicknesses. The boss core is set into the print formed and this completes the bottom half of the mould. A flat covering top part will complete the full mould. The outer rim may be formed by segmental cores instead of being swept as shown in fig. 13. Assuming a spur wheel to be required then the finishing of the bottom part of the mould is shown in fig. 14, where are also seen the method of placing the outer cores to form the teeth and the spacing of the cores to form the arms and boss.

Loam Moulding.—This is a distinct section of the foundry industry. Loam represents clayey mixtures of sand worked at about the consistency of stiff slurry. The moulds are built up of brick carried on plates to suit the contour of the castings and faced with loam. In general the loam is swept to required contour as in the case of sand, brackets or irregular shapes being formed by building in loose wooden patterns. Complete or skeleton patterns are also used in loam moulding, the respective joints for separating the mould being carried on plates or rings. The built up or swept moulds are partly dried before separating the respective sections for withdrawing patterns and finishing the mould faces and each section is completely dried before final assembly. On final closing with all cores in position the various plates forming the mould structure are bolted together and the mould firmly tied in order to resist the pressure of the molten metal. Rapid moulding of repeat castings is ensured by labour saving devices.

Plate Moulding.—The first mechanical aid to note is that of plate moulding. A plate with projecting snugs drilled to fit the moulding box pins is mounted with patterns and runners to form the complete mould; true alignment of patterns on each side of the plate is essential, and the method follows the usual sand ramming, lifting off the top box and drawing the plate. The plate forms the mould joint and, with runners in the form of patterns, moulding time is reduced. A number of patterns may be mounted on one plate and in repetition castings large outputs follow. The next step in advance is to ram the mould mechanically, effected in practice by pressure from a hand lever or hydraulic or compressed air rams. Various types of machines are available all having the common principle of a mounted pattern plate but differing in the method of feeding and ramming the sand and automatically separating the top and bottom boxes from the plate. A promising method lately developed is "sand slinging," or blowing the sand into the box by means of compressed air, a method which offers possibilities of general application.

Nonferrous alloy castings may be made in permanent metal moulds; research in this branch of die casting is proceeding and promising results have already been obtained. In other directions, notably with cast-iron water pipes, centrifugal casting in rotating metallic moulds is proving successful.

FOUNDLING HOSPITALS. It is significant that these institutions are gradually becoming things of the past, and that there are few countries left in which hospitals are found which exist solely for the purpose of receiving "foundlings," i.e., children who have been abandoned or exposed, and left for the public to find and save. Definite institutions for the care of foundlings were established during the 7th and 8th centuries in Trèves, Milan and Montpellier, followed by others in Venice during the 14th and in Paris and Lyons during the 17th centuries. The celebrated Foundling Hospital of London was established by Captain Coram in 1739 and has since completely changed its original character.

The modern method of dealing with illegitimate children—and nearly all those who were placed in Foundling Hospitals were born out of wedlock—is based on the proved advantage both to the mother and child of keeping them together, at any rate for the first year, thereby greatly reducing the infant mortality rate, strengthening the natural ties and lessening the chance of the mother erring a second time. There is also an increasing reluctance, owing to the great risk of infection, to herd very young children together in large institutions so that the boarding-out, or foster-mother system of caring for these children is being more and more employed in all countries.

At first the London Foundling Hospital admitted any child under two months of age who was free from certain specified diseases, without any questions being asked or any attempt made to identify its parents. Grants were made by Parliament to the Hospital from 1756 onwards, £10,000 being paid to the governors in that year, on condition that all children offered under 2 months, subsequently increased to one year, were received. In 1757 no fewer than 3,727 children were admitted and branch hospitals at Ackworth, Shrewsbury, Westerham, Aylesbury and Barnet were opened, to cope with the number of children for whom admission was sought, the cost of establishing these country hospitals amounting to over £40,000. This general admission was soon found to be a serious error, for the social evils surrounding the conditions of illegitimate birth received no check, and of the 14,934 children received during the 3 years and 10 months it was in force, no less than 10,389 died in early infancy. Parents even brought dying children for the purpose of having them buried at the expense of the Hospital, and strangers were employed by parents to bring their children from the country to the Hospital in Bloomsbury, London, at so much per head; many such children, through the brutality or criminal negligence of those to whom they were entrusted, never reached their destination alive.

By 1760 the House of Commons decided that the indiscriminate admission of children should cease, and State aid came to an end in 1771. From that time onwards the Hospital has had to depend on private philanthropy for its funds, and has gradually amended the conditions under which children are admitted. The following are the present rules for admission:—

Children can only be received upon the personal application of the mothers. The children of married women and widows are not received. Petitions must set forth the true state of the mother's case, and if any deception is used the petition will be rejected. No application can be received previous to the birth of the child, nor after it is 12 months old. No child can be admitted unless the committee is satisfied, after due enquiry, of the previous good character and present necessity of the mother, and that both mother and child have been deserted by the father.

The children are placed out to nurse with cottagers in the country, under the superintendence of medical officers, and are returned to the Hospital about the age of six. The 56 acres comprising the estate of the Hospital, purchased in 1741 for £6,500, had enhanced so much in value by 1926 that the Governors decided that it would be in the best interests of the institution to sell the site and remove to new premises in the country. The sale of the estate and buildings realized £1,650,000 and the children were housed in temporary premises at Redhill, pending the erection of suitable new premises elsewhere. Over 500 children are maintained annually by the institution.

Continent of Europe.—In Germany there have never been many foundling hospitals as distinguished from orphanages. There is, however, a German Society for modern foundling hospitals, which seeks to found new institutions of this sort and which maintains one such home at Unterhaching, near Munich, where deserted children are cared for up to two years of age. Illegitimate children are kept with their mothers as far as possible during infancy, but as there are only about 100 homes for unmarried mothers with their babies throughout the country, the provision is obviously inadequate.

In Russia, according to a report furnished in 1927 by the Red Cross Society of the U.S.S.R., the number of homes for children had increased from 7 in 1917 to 720 by the end of 1925. All

maternity and child welfare work under the People's Commissariat of Health is maintained out of a special fund for this purpose, as well as by local health authorities and philanthropic and other bodies. Out of certain funds set aside for the prevention of child vagrancy, homes for married and unmarried mothers with children are provided and premiums given to nursing mothers, with a view to preventing child desertion. The establishment of village nurseries, of which there were 4,052 in 1927, where mothers who have to work, especially in the fields during the summer months, can temporarily leave their children, has also helped to solve the problem of the deserted child.

In Roumania there are very few foundling hospitals that are not at the same time orphanages. One such institution, the *Alinarea* at Galatz, combines the functions of an emergency home for babies with those of a foundling home and orphanage, for it accepts babies temporarily while their mothers are ill, or, if the latter die in childbirth, till the babies are old enough to be cared for in their own homes by the father or other relation. This home, founded in 1901, was the first in the country to receive Government recognition. The mortality rate among the foundlings was high, as much as 80% in some years, due to exposure to cold before they are found deserted in the streets and to certain specific diseases. There are altogether eight foundling hospitals in Roumania. Much of the money spent by the State in aiding institutions of this kind is derived from the sale of the special *Assistentia Sociala* postage stamp, value 25 bani, which it is obligatory to add to the ordinary stamps on all letters conveyed from one part of the country to another, as well as on all public documents. (J. HA.)

United States.—Foundling hospital and foundling are terms no longer common in the United States despite the continued existence of a number of institutions for abandoned and deserted children. The use of these words is practically restricted to the groups specifically concerned with social service. That they are falling into disuse is due to the newer welfare methods of organized charity which discover family ties, which enable mother and child to be kept together and out of which the system of child placement has arisen.

The foundling hospital in America was instituted about 1850–60 by Catholic nuns, Protestant churches or private individuals such as Dr. George E. Shipman in Chicago and Dr. John S. Parry in Philadelphia, doctors appalled at the high mortality among exposed infants; records covering a period of 20 years in one hospital show that of a yearly average of 52 admittances there were 35 deaths. The first institution designated for foundlings seems to have been St. Vincent's Infant asylum (448 children), established by the Sisters of Charity (St. Vincent de Paul) in Baltimore, Md., in 1856. Between 1860–73 six others were founded: two in Washington, D.C., and one each in San Francisco, New York, Chicago and Cleveland.

Of 1,151 institutions for the care of children, according to the 1910 census—the only one with such a classification—28 are described for foundlings and for "abandoned" or "deserted" children as well as for dependents and orphans in the District of Columbia, California, Florida, Georgia, Illinois, Indiana, Louisiana, Maryland, Michigan, Missouri, New Jersey, New York, Ohio, Pennsylvania, Tennessee, Virginia and Wisconsin. The present New York Foundling hospital under the Sisters of Charity is the largest (700). Foundlings and deserted children in New York city and mothers with their infants if they are willing to act as nurses are received. There is a country home supported by voluntary contributions and a per caput allowance from the city connected with this institution at St. Joseph's-by-the-Sea, near Huguenot, Staten Island.

FOUNTAIN, a term applied equally to simple arrangements for letting water gush into an ornamental basin and to more elaborate ones by which water is mechanically forced into high jets, to the ornamental receptacle and to the jet of water itself. A very early extant example is preserved in the carved Babylonian basin (c. 3000 B.C.) found at Tello, the ancient Lagash, and Layard mentions an Assyrian fountain, found by him in a gorge of the river Gomel, which consists of a series of basins cut in the solid rock and descending in steps to the stream. (A. H. Layard, *Dis-*

coveries Among . . . Ruins of Nineveh and Babylon, p. 182, 1853.) The water had originally been led from one to the other by small conduits, the lowest of which was ornamented by two rampant lions in relief.

Greek.—During the Aegean civilization, as in later Hellenic Greece, springs were frequently considered sacred and shrines were built round them, the water often emerging into artificial

BY COURTESY OF THE "JOURNAL OF AMERICAN ARCHAEOLOGY"
QUADRANGULAR BASIN OF THE FOUNDATION DEDICATED TO THE NYMPH PIRENE AT CORINTH. THE WATER WAS RECEIVED IN THIS ENCLOSURE AFTER FLOWING THROUGH A NUMBER OF CELLS

basins. In historic Greece, such fountains, more highly developed, with cut stone openings and marble basins, were common, and both literary references and excavated remains abound. Frequently the fountain proper was surrounded by a wall and occasionally small rooms, used for shrines or for *ex-voto* offerings, stood near by. Some were surrounded by columns, as at Lerna. Groves were sometimes planted in connection with the fountain shrines. The city of Corinth was particularly noted for its fountains, the most famous being that dedicated to the nymph Pirene, whose tears, in bewailing her sons, slain by Artemis, were claimed by myth as the origin of the spring.

Roman.—In Roman civilization water was distributed from each terminal reservoir, or *castellum*, not only to baths and to large houses, but also to many public fountains from which the poorer people drew their supply. In many cases these fountains, usually at street corners, were decorated with human, animal or grotesque heads, from whose mouths the water issued. Several such public fountains have been uncovered at Pompeii. A characteristic example, standing on a street corner near the house of Pansa, consists of a rectangular basin on the edge of the curb with a small carved pedestal rising behind it and a small sinkage at the front of the basin, which acted as an overflow. In addition to these small public fountains, great monumental structures known as *nymphaea* (see NYMPHAEUM) were constructed for purely decorative purposes. These structures, like the Greek fountains, were considered shrines to nymphs, and often took the shape of an *exedra* (q.v.) covered by a half dome, and in Roman imperial times were richly decorated. A good example exists near the agora at Ephesus. Fountains were much used as garden decorations by the Romans. Three forms are found. In the first the water gushes from a statue or mass into a basin, and from that trickles down into lower and wider basins. The second resembles a miniature *nymphaeum* and consists of a decorative niche containing the fountain proper. Two charming examples of this type have been found in Pompeii with the niches decorated by mosaics, predominantly blue, and ornamented with bands of small sea shells. The third type is that known to-day as the *jet d'eau* in which water under a considerable head or pressure, is led to a small vertical orifice from which it spouts high in the air. Wall paintings from Pompeii and in the Museo delle Terme at Rome show the type clearly.

Mediaeval.—During the earlier middle ages, although occasional architectural treatments of natural springs are found, fountains elsewhere passed out of use; wells furnished the greater part of the necessary water. From the 12th century, however, public fountains began to reappear, and the spring fountains re-

Fountain in the Piazza of St. Peter's, Rome (Bernini, architect); Italian Baroque, 17th century

ceived a more highly developed architectural treatment. The usual form of the latter consisted of a large basin reached by a descending stairway and covered over with a vault, sometimes enclosed and sometimes supported only on piers. At Poitiers, the *Fontaine Joubert* (14th century, restored 1597) was originally of this type. Other crude examples are common in Brittany. The public fountains of the mediaeval towns usually had a polygonal or circular basin, occasionally lobed, in the centre of which rose a column or pier carrying a series of spouts. The architectural details are of infinite variety. From the simple hexagonal vase and column of the 12th century fountain at Provins to the elaborate richness of the 15th century fountains of south Germany, every kind of Gothic detail is found. Particularly noteworthy is the *Schöne Brunnen* at Nuremburg (1385-96), distinguished by its high, rich, Gothic spirelet, with many statues, and the iron railing which surrounds it.

Renaissance.—With the coming of the early Renaissance in Italy, a new phase of fountain design, in which sculpture played an ever increasing part, began. The earlier examples consist, usually, of a series of basins, frequently circular, one above the other, the smallest at the top, the whole crowned by the fountain figure, from which the water spouts. Later the complexity of basin and water treatment was increased and many figures, instead of one, were sometimes used, as in Bernini's famous fountain in the Piazza di Navona in Rome, where Tritons and river gods decorate a mass of rustic masonry in the centre. Equally well known are the fountains that he added to the piazza in front of S. Peter's, as simple as the former is complex. In each of these a single enormous vertical jet of water falls into a simple upper basin and from that into a larger lower basin. The same Baroque period saw the addition of monumental fountains more allied to the Roman *nymphaea*, in which the water was hardly more than an incident in a vast architectural composition. Such are the Aqua Paola and the fountain of Trevi, both at Rome, the former,

FOUNTAIN OF THE INNOCENTS, THE EARLIEST ORNAMENTAL FOUNTAIN ERECTED AT PARIS. THE BAS-RELIEFS AND DECORATIONS ARE BY JEAN GOUJON (1520-1566). THIS IS AN ORIGINAL WORK AND DOES NOT FOLLOW THE ITALIAN PRECEDENT

by Fontana and Della Porta (c. 1600) and the latter built in the 18th century from designs probably by Bernini. In addition to these public fountains, the Baroque period in Italy produced an enormous number of villa fountains of all types, frequently of the most fantastic design, like the water organ of the Villa d'Este, Tivoli, controlled by elaborate mechanical devices so as to play only when certain pavement stones were stepped on, etc., as in the small terrace fountains of the same villa.

French fountains often follow Italian precedent, although the Fontaine des Innocents, in Paris, by Jean Goujon (early 16th century) is an original work of much charm, but in general, city fountains of north and west Europe are merely variations of types already set in Rome. Characteristically naïve and fantastic in its use of sculpture is the famous little fountain in Brussels known as the Mannikin, by Duquesnoy, 1619, upon which Louis

XV. is supposed to have conferred the Cross of St. Louis. A remarkable example of the architectural niche type is the lovely Medici fountain in the Luxembourg Gardens in Paris, by de Brosse, early in the 17th century. The great group of fountains at Versailles, with its magnificent combination of jets of water and sculpture is only a fantastic development on an enormous scale of ideas originally developed in the Italian Baroque villas.

ONE OF THE SEVERAL HUNDRED DRINKING FOUNTAINS OR "SEBELS" AT CAIRO. THESE ARE IMPORTANT INSTITUTIONS IN THE MOHAMMEDAN EAST

Mohammedan.—The fountains of Muslim countries are of great interest and beauty. They usually take the form of small square buildings, richly decorated, on the sides of which are the spouts and basins, but simpler forms of great beauty in which the spout and basin are merely enclosed within a graceful niche exist.

Modern.—In modern times the practical necessity of fountains has largely disappeared. Horse troughs and small drinking fountains are, however, still plentiful in most cities. In general, these are of the simplest design, and the most recent are of the so-called bubbling type, in which the water is drunk directly from the jet without a cup. For decorative and monumental use, however, fountains are more common than ever. In the smaller types modern sculpture has found one of its most congenial outlets. A magnificent example of the modern monumental fountain is the Buckingham Memorial Fountain at Chicago (1927) by Jacques Lambert, of Paris, and Bennet, Parsons and Frost, of Chicago. (T. F. H.)

FOUNTAIN PEN. A pen with a reservoir of ink which automatically feeds the nib when the instrument is in use. In its practical form, it dates back only to the eighteen-eighties.

DETAILS OF THE FOUNTAIN PEN SHOWING ORDINARY TYPE (FIG. 1.) AND SELF-FILLING TYPE (FIG. 2.)

A. nib; B. feed bar; C. connection between feed bar and barrel; D. barrel; E. cap; F. showing how parts fit together. In Fig. 2. C is a flexible rubber sac, acting as the ink reservoir, which is filled by operating the lever on D

The modern fountain pen is a simple contrivance. In the first example shown (fig. 1), there are only five parts: the barrel to hold the ink, a feed bar to regulate the flow of ink (B), a nib (A), a small section which screws into the barrel and carries the feed bar and the nib, and a cap to cover the nib when the pen is not in use (E).

One of the most important parts of a fountain pen is the feed. This is the device which controls the passage of ink from the barrel to the nib. The feed shown in the illustration is extremely simple. A channel about $\frac{1}{16}$ " wide is grooved along the top of the feed, and in this channel are the capillary fissures which convey the ink from the barrel to the point of the nib, the air being drawn into the reservoir along the channel. On each side of this channel are three pockets or recesses. These are designed to collect any surplus ink and hold it in readiness to meet the requirements of the writer. Thus is secured a regular flow of ink to the point of the nib, automatically controlled by the writer's own action: the release being exactly in accordance with the pressure.

The barrel of this type of pen is entirely devoted to the storage of ink. The filling is done by means of a glass tube with rubber bulb, the point section being easily detached and the ink conveyed

straight into the barrel, which will hold enough to form several thousand words. This pen should, when carried, be upright.

Safety Type.—But there is a "Safety" type which can be carried in any position without risk of leakage.

In this case spiral grooves are cut inside the barrel, and a rod extending right across its internal diameter and working in these grooves carries the nib into position for writing and the reverse action draws the nib down into the barrel when not required. The rod is operated very easily, the best way being to place the cap firmly on the end of the pen and then turn it until the nib is in the writing position. It is necessary when closing the pen to hold it upright because directly the nib is even slightly withdrawn from the writing position there is nothing to prevent the ink flowing out until the cap is replaced. It is like a bottle with the cork out. This cap is fitted with a plug which completely seals the barrel and because of this plug it is necessary that the nib should be below the level of the top end of the barrel, otherwise it will be broken.

Self-fillers.—There have been many inventions designed to fill the pen by suction instead of by the use of a glass filler. Fig. 2 shows a self-filling type. In this case the ink is carried in a flexible rubber sac inside the barrel. The sac (C) fits closely on the inner end of the point section and a lever, operating at the side, fills the pen by suction when, with nib immersed in ink, the lever is lowered.

Though the modern high grade fountain pen has rightly been described as a simple contrivance, its manufacture is a most elaborate and costly process. Over 200 distinct and separate operations are required to make the pen which is illustrated in this article, and the materials used come from all parts of the world.

The barrel is made of vulcanised rubber but, in certain pens, of compounds variously known as radite, pyroxilin and permanite, in a great variety of colours. The nib is made of gold, and the point is tipped with an even more costly metal, iridium, which, being very much harder than gold gives the nib the necessary durability.

FOUQUÉ, FERDINAND ANDRÉ (1828-1904), French geologist and petrologist, was born at Mortain, La Manche, on June 21, 1828. In 1877 he became professor of natural history at the Collège de France, in Paris. As a stratigraphical geologist he rendered much assistance on the Geological Survey of France, and he was the first to introduce modern petrographical methods into France. Fouqué died on March 7, 1904. His chief publications were: *Santorin et ses éruptions* (1879); with A. Michel Lévy *Minéralogie micrographique, Roches éruptives françaises* (2 vols., 1879); and *Synthèse des minéraux et des roches* (1882).

FOUQUÉ, FRIEDRICH HEINRICH KARL DE LA MOTTE, BARON (1777-1843), German romantic writer, was born on Feb. 12, 1777 at Brandenburg. Fouqué owed his introduction to literature to A. W. Schlegel, who published his first book, *Dramatische Spiele von Pellegrin* in 1804. His next work, *Romanzen vom Tal Ronceval* (1805), showed more plainly his allegiance to the romantic leaders, and in the *Historie vom edlen Ritter Galmy* (1806) he versified a 16th-century romance of mediaeval chivalry. *Sigurd der Schlangentöter, ein Heldenpiel* (1808), the first modern German dramatization of the *Nibelungen* saga, attracted attention to him, and influenced considerably subsequent versions of the story.

Between 1810 and 1815 the romances and novels, plays and epics, which Fouqué turned out with extraordinary rapidity, appealed exactly to the mood of the hour. The earliest of these are the best—*Undine* (1811), being, indeed, one of the most charming of all German *Märchen* and the only work by which Fouqué's memory still lives to-day. A more comprehensive idea of his powers may, however, be obtained from the two romances *Der Zauberring* (1813) and *Die Fahrten Thiodulfs des Isländers* (1815). From 1820 onwards the quality of Fouqué's work rapidly degenerated. He died in Berlin on Jan. 23, 1843.

Fouqué's *Ausgewählte Werke*, edited by himself, appeared in 12 vols. (1841); a selection, edited by M. Koch, will be found in Kürschner's *Deutsche Nationalliteratur*, vol. 146, part ii. (Stuttgart, 1893); *Undine*, *Sintram*, etc., in innumerable reprints. Bibliography in

Goedeke's *Grundriss zur Geschichte der deutschen Dichtung* (2nd ed., vi. pp. 115 ff., Dresden, 1898). Most of Fouqué's works have been translated, and the English versions of *Aslauga's Knight* (by Carlyle), *Sintram and his Companions* and *Undine*, have been frequently republished. For Fouqué's life to the year 1813 see his autobiography, *Lebensgeschichte des Baron Friedrich de la Motte Fouqué* (Halle, 1840). For criticism, see Jenthe, *Fouqué als Erzähler* (1910); Th. Krämer, *Das romantische Ritterspiel bei Fouqué* (1913); G. Mehlis, *Die deutsche Romantik* (Munich, 1922); J. Haupt, *Elementargeister bei Fouqué, Immermann und Hoffmann* (Leipzig, 1923).

FOUQUET, JEAN or JEHAN (c. 1415-1485), French painter, born at Tours, is the most representative and national French painter of the 15th century. He was in Italy about 1437, where he executed the portrait of Pope Eugenius IV., and upon his return to France, whilst retaining his purely French sentiment, he grafted the elements of the Tuscan style, which he had acquired during his sojourn in Italy, upon the style of the Van Eycks, which was the basis of early 15th-century French art, and thus became the founder of an important new school. He was court painter to Louis XI. Though his supreme excellence as an illuminator and miniaturist, of exquisite precision in the rendering of detail, and his power of clear characterization won for him an eminent position in the art of his country, his importance as a painter was only realized when his portraits and altarpieces were for the first time brought together in 1904, at the exhibition of the French Primitives held at the Bibliothèque Nationale in Paris. One of Fouquet's most important paintings is the diptych, formerly at Notre Dame de Melun, of which one wing, depicting Agnes Sorel as the Virgin, is now at the Antwerp Museum and the other, representing Etienne Chevalier, the Lord High Treasurer of France, in the Berlin Gallery. The Louvre has his oil portraits of Charles VII., and of Jouvénal des Ursins, besides a portrait drawing in crayon. The Museum at Chantilly contains 40 miniatures from a Book of Hours, painted before 1461 for Etienne Chevalier. From Fouquet's hand again are 11 out of the 14 miniatures illustrating a translation of Josephus at the Bibliothèque Nationale. Two further works in the same library are ascribed to him: the "Statutes of the Order of St. Michael," and the "Chronique de France." A Boccaccio at Munich is also believed to be by him.

See A. de Champeaux and P. Gauchery, *Oeuvres d'art exécutées pour le duc de Berry*; "Facsimiles of two histories by Jean Fouquet" from vols. i. and ii. of the *Anciennetés des Juifs* (London, 1902); and Georges Lafenestre, *Jehan Fouquet* (1905). P. Durrieu: *Les antiquités judaïques* (1908); A. Gruyer, *Chantilly* (1897); *Les Quarante Fouquet* (1900); Hulin, *L'exposition des prim. franç.* (1904); Yates Thomson, "The Romance of a Book," *Burlington Magazine* (1906); Max Friedländer, "Die Votivtafel des Etienne Chevalier," *Jahrbuch der Königl. Preuss. Kunstsammlungen* (1896); L. M. Richter, *Chantilly* (1913).

FOUQUET (or FOUQUET), NICOLAS (1615-1680), viscount of Melun and of Vaux, marquis of Belle-Isle, superintendent of finance in France under Louis XIV., was born in Paris in 1615. He belonged to an influential family of the noblesse de la robe, and was admitted as *avocat* at the parlement of Paris at the age of 13. In 1636 he bought the post of *maître des requêtes*. From 1642 to 1650 he held various intendances at first in the provinces and then with the army of Mazarin, and, coming thus in touch with the court, was permitted in 1650 to buy the important position of *procureur général* to the parlement of Paris. During Mazarin's exile Fouquet shrewdly remained loyal to him, protecting his property and keeping him informed of the situation at court.

Upon the cardinal's return, Fouquet demanded and received as reward the office of superintendent of the finances (1653). The appointment was a popular one with the moneyed class, for Fouquet's great wealth had been largely augmented by his marriage in 1651 with Marie de Castille, who also belonged to a wealthy family of the legal nobility. His own credit, and his unflinching confidence in himself, strengthened the credit of the government, while his high position as *procureur général* secured financial transactions from investigation. As minister of finance, he soon had Mazarin almost in the position of a suppliant. The long wars, and the greed of the courtiers, made it necessary at times for Fouquet to borrow upon his own credit, but he soon

turned this confusion of the public purse with his own to good account. The disorder in the accounts became hopeless; fraudulent operations were entered into with impunity, and the financiers were kept in the position of clients by official favours and by generous aid whenever they needed it. Mazarin was too deeply implicated in similar operations to interfere, and was obliged to leave the day of reckoning to his agent and successor Colbert. Upon Mazarin's death Fouquet expected to be made head of the government; but Louis XIV. decided otherwise. In August 1661 Louis XIV., already set upon his destruction, was entertained at Fouquet's great house at Vaux with a *fête* rivalled in magnificence by only one or two in French history. The splendour of the entertainment sealed Fouquet's fate. Three weeks after his visit to Vaux the king took Fouquet with him to Nantes and had him arrested on the charge of embezzlement. His trial lasted almost three years, and violated the forms of justice. Public sympathy was strongly with Fouquet, and Lafontaine, Madame de Sévigné and many others wrote on his behalf; but when Fouquet was sentenced to banishment, the king, disappointed, "commuted" the sentence to imprisonment for life. He was sent at the beginning of 1665 to the fortress of Pignerol, where he died on March 23, 1680. A report of his trial was published in Holland, in 15 volumes, in 1665-1667, in spite of the remonstrances which Colbert addressed to the States General. A second edition under the title of *Oeuvres de M. Fouquet* appeared in 1696.

See Chéruel, *Mémoires sur la vie publique et privée de Fouquet . . . d'après ses lettres et des pièces inédites* (2 vols., 1864); J. Lair, *Nicolas Fouquet*, . . . (2 vols., 1890); U. V. Châtelain, *Le Surintendant Nicolas Fouquet* . . . (1905).

FOUQUIER-TINVILLE, ANTOINE QUENTIN (1746-1795), French revolutionary, was born at Hérouel, Aisne. Originally a *procureur* attached to the Chatelet at Paris, he sold his office in 1783, and became a clerk under the lieutenant-general of police. He was public prosecutor to the Revolutionary Tribunal of Paris (March 10, 1793 to July 28, 1794). His function was not so much to convict the guilty as to see that the proscriptions ordered by the faction for the time being in power were carried out with a due regard to a show of legality. He was as ruthless and as incorrupt as Robespierre himself; he could be moved from his purpose neither by pity nor by bribes. His passionless detachment made him an effective instrument of the Terror. He had no forensic eloquence; but the cold obstinacy with which he pressed his charges was more convincing than any rhetoric, and he seldom failed to secure a conviction.

His horrible career ended with the fall of Robespierre and the Terrorists on the 9th Thermidor. On Aug. 1, 1794, he was imprisoned by order of the Convention and brought to trial. His defence was that he had only obeyed the orders of the Committee of Public Safety; but, after a trial which lasted 41 days, he was condemned to death, and guillotined on May 7, 1795.

See the documents relating to his trial enumerated by M. Tournoux in *Bibliographie de l'histoire de Paris pendant la Révolution Française*, vol. i. Nos. 4445-4454 (1890); also F. Dunoyer, *Fouquier-Tinville* . . . (1913).

FOUR-CENTRED ARCH, in architecture, a pointed arch described from four centres, the smaller radius usually being nearer the spring (see *ARCH*).

FOURCHAMBAULT, a town of central France in the department of Nièvre, on the right bank of the Loire, 4½ m. N.W. of Nevers, on the Paris-Lyon railway. Pop. (1926) 4,659. It has large iron-works, established in 1821, which produce engineering material for railway, military and other purposes. Among the more remarkable *chefs-d'oeuvre* of the town are the metal portions of the Pont du Carrousel, the iron beams of the roof of Chartres cathedral, and the vast spans of the bridge over the Dordogne at Cubzac. A small canal joins the works to the Lateral canal of the Loire.

FOURCROY, ANTOINE FRANÇOIS, COMTE DE (1755-1809), French chemist, the son of an apothecary in the household of the duke of Orleans, was born at Paris, on June 15, 1755. He took up medical studies on the advice of the anatomist Félix Vicq d'Azyr (1748-94), and after many difficulties, due to

poverty, obtained his doctor's diploma in 1780. His attention was specially turned to chemistry by J. B. M. Bucquet (1746-80), professor of this subject at the Medical School of Paris, and in 1784 he was appointed lecturer in chemistry at the college of the Jardin du Roi. Fourcroy proved himself to be a teacher and an organizer rather than an original investigator, and his published papers, though numerous, are not important. He was one of the earliest converts to the views of Lavoisier (*q.v.*). Fourcroy died in Paris on Dec. 16, 1809, the very day on which he had been created a count of the French empire.

FOUR HUNDRED, in the United States, the expression popularly used to denote the inner circle of highest society. The term originally applied to New York city society and is said to have arisen in 1892 when Mrs. William Astor asked Ward McAllister, a celebrated leader of society in New York city, to assist her in cutting down the invitation list of her annual ball to 400 persons as that was as many as her ballroom would accommodate. McAllister, who held a unique though self-appointed position as directing executive of New York society functions at that time, was heard to remark afterward at one of his clubs that there were really only 400 people living in New York city who had any claim to be called "society." The remark was repeated and spread rapidly until newspapers and magazines were full of discussions on it. From that time on the term became commonly used. It has, however, lost all meaning in recent years. There is no New York society in McAllister's sense of the term. There are scores of social groups and levels but no hierarchy.

FOURIER, FRANÇOIS CHARLES MARIE (1772-1837), French socialist writer, was born at Besançon, Franche-Comté, on April 7, 1772. After completing his studies in his native town he travelled for some time in France, Germany and Holland. Fourier entered the army, but after two years' service as a chasseur was discharged on account of ill-health. In 1803 he published a remarkable article on European politics which attracted the notice of Napoleon, some of whose ideas were foreshadowed in it. Inquiries were made after the author, but nothing seems to have come of them. After leaving the army Fourier entered a merchant's office in Lyons, and afterwards earned his living as a broker, devoting his leisure time to study.

He had become deeply impressed with the conviction that social arrangements resulting from the principles of individualism and competition were essentially imperfect and immoral. He proposed to substitute for these principles co-operation or united effort, by means of which full and harmonious development might be given to human nature. The scheme, worked out in detail in his first work, *Théorie des quatre mouvements* (2 vols., Lyons, 1808, published anonymously), has for foundation a particular psychological proposition and a special economical doctrine. Psychologically Fourier held what may with some laxity of language be called natural optimism,—the view that the full, free development of human nature or the unrestrained indulgence of human passion is the only possible way to happiness and virtue, and that misery and vice spring from the unnatural restraints imposed by society on the gratification of desire. This principle of harmony among the passions he regarded as his grandest discovery. Throughout his works, in uncouth, obscure and often unintelligible language, he demonstrates the fundamental harmony to be found in the four great departments,—society, animal life, organic life and the material universe. In order to give effect to this principle and obtain the resulting social harmony, society should be reconstructed; for, in the existing organization of society innumerable restrictions are imposed upon the free development of human desire. As practical principle for such a reconstruction Fourier advocated co-operative or united industry. But the full realization of his scheme demanded much more than the mere admission that co-operation is economically more efficacious than individualism. Society as a whole must be organized on the lines requisite to give full scope to co-operation and to the harmonious evolution of human nature.

Society, on his scheme, is to be divided into departments or *phalanges*, each *phalange* numbering about 1,600 persons. Each *phalange* inhabits a *phalanstère* or common building, and has a

certain portion of soil allotted to it for cultivation. The *phalanstères* are built after a uniform plan, and the domestic arrangements are laid down very elaborately. The staple industry of the *phalanges* is, of course, agriculture, but the various *séries* and *groupes* into which the members are divided may devote themselves to such occupations as are most to their taste; nor need any occupation become irksome from constant devotion to it. Any member of a group may vary his employment at pleasure, may pass from one task to another. The tasks regarded as menial or degrading in ordinary society can be rendered attractive if advantage is taken of the proper principles of human nature. It is not, on Fourier's scheme, necessary that private property should be abolished, nor is the privacy of family life impossible within the *phalanstère*. Each family may have separate apartments, and there may be richer and poorer members. But the rich and poor are to be locally intermingled, in order that the broad distinction between them, which is so painful a feature in actual society, may become almost imperceptible. Out of the common gain of the *phalange* a certain portion is deducted to furnish to each member the minimum of subsistence; the remainder is distributed in shares to labour, capital and talent,—five-twelfths going to the first, four-twelfths to the second and three-twelfths to the third. Upon the changes requisite in the private life of the members Fourier was in his first work more explicit than in his later writings. The institution of marriage is of necessity abolished; a new and ingeniously constructed system of licence is substituted.

The scheme thus sketched attracted no attention when the *Théorie* first appeared, and for some years Fourier remained in his obscure position at Lyons. In 1812 the death of his mother put him in possession of a small sum of money, with which he retired to Bellay in order to perfect his second work. The *Traité de l'association agricole domestique* was published in 2 vols. at Paris in 1822, and a summary appeared in the following year. After its publication the author proceeded to Paris in the hope that some wealthy capitalist might be induced to attempt the realization of the projected scheme. Disappointed in this expectation he returned to Lyons. In 1826 he again visited Paris, and as a considerable portion of his means had been expended in the publication of his book, he accepted a clerkship in an American firm. In 1829 and 1830 appeared what is probably the most finished exposition of his views, *Le Nouveau Monde industriel*. In 1831 he attacked the rival socialist doctrines of Saint-Simon and Owen in the small work *Pièges et charlatanisme de deux sectes, St. Simon et Owen*. His writings now began to attract some attention. A small body of adherents gathered round him, and the most ardent of them was Victor Considérant (*q.v.*). In 1832 a newspaper, *Le Phalanstère ou la réforme industrielle* was started to propagate the views of the school, but its success was not great. In 1833 it declined from a weekly to a monthly, and in 1834 it died of inanition. It was revived in 1836 as *Le Phalange*, and in 1843 became a daily paper, *La Démocratie pacifique*. In 1850 it was suppressed.

Fourier did not live to see the success of his newspaper, and the only practical attempt during his lifetime to establish a *phalanstère* was a complete failure. In 1832 M. Baudet Dulary, deputy for Seine-et-Oise, who had become a convert, purchased an estate at Condé-sur-Vesgre, near the forest of Rambouillet, and proceeded to establish a socialist community. The capital supplied was, however, inadequate, and the community broke up in disgust. Fourier was in no way discouraged by this failure, and till his death, on Oct. 10, 1837, he lived in daily expectation of the realization of his scheme.

Several experiments on the lines laid down by Fourier were made in the United States by American followers of Fourier, whose doctrines were introduced there by Albert Brisbane (1809–1890). Indeed, in the years between 1840 and 1850, during which the movement waxed and waned, no fewer than 41 *phalanges* were founded, of which some definite record can be found. The most interesting of all the experiments, not alone from its own history, but also from the fact that it attracted the support of many of the most intellectual and cultured Americans was that of Brook Farm (*q.v.*).

FOURIER, JEAN BAPTISTE JOSEPH (1768–1830), French mathematician, was born at Auxerre on March 21, 1768. Left an orphan at eight years old, he was educated at the military school of Auxerre, where he became a teacher of mathematics (1784). He taught at the École Normale at Paris from its institution in 1795, and was later professor of analysis at the École Polytechnique. He accompanied Bonaparte to Egypt in 1798, and was made governor of Lower Egypt; he organized munitions workshops when the English fleet cut off supplies. He contributed many papers on mathematics to the Institut du Caire, founded by Napoleon to strengthen French influence in the Levant. Returning to France in 1801, he became, in 1802, prefect of Isère, and in 1808 baron and chevalier of the Legion of Honour. At Grenoble he carried on elaborate investigations into the conduction of heat. He settled in Paris in 1816, and in 1822 he became joint secretary of the Académie des Sciences with Cuvier. In 1827 Fourier succeeded Laplace as president of the council of the École Polytechnique. He died in Paris on May 16, 1830.

Fourier's *Théorie Analytique de la Chaleur* (1822, trans. A. Freeman, 1872) marked an epoch in the history of mathematical physics (see below, **FOURIER SERIES**). Navier completed and published his unfinished *Analyse des équations déterminées* (1831). This work contained the development of an early paper of his on the resolution of numerical equations, and also "Fourier's theorem" on the real roots of an equation between two limits.

A list of Fourier's publications is given in the *Catalogue of Scientific Papers of the Royal Society of London*; a selection of his works was edited by Gaston Darboux, *Oeuvres de Fourier* (Paris, 1880–90). See also Arago, "Joseph Fourier," in the *Smithsonian Report* (1871).

FOURIER SERIES, which are also called *trigonometric series*, take their name from Jean Baptiste Joseph Fourier (see above), author of *La théorie analytique de la chaleur* (1822). A great many problems of analytical physics, notably those which relate to the radiation of heat, are easily solved when the initial state is represented by a simple periodic function, as the sine or cosine of the variable or of an integral multiple of the variable. When the initial conditions are entirely arbitrary, it is natural to attempt to represent it by the sum of a finite or infinite number of such simple periodic functions; i.e., by a trigonometric series. The problem had already been stated by Euler, but before Fourier's time mathematicians had not thought such a representation possible, except for those functions called by Euler *continuous functions*, i.e., those which may be represented geometrically by a unique continuous curve. The great discovery of Fourier was the representation of any discontinuous function by a trigonometric series, i.e., by a series of continuous functions. The simplest type of such a discontinuous function is one which is equal to zero in certain intervals and to one in certain other intervals. In this way problems in mathematical physics can be solved for any initial conditions when one knows how to solve for the simple periodic initial conditions.

In his *Théorie analytique de la chaleur* Fourier indicates also, with respect to the radiation of heat in a sphere, how an arbitrary function might be developed in a series in which the terms are proportional, not to the sines and cosines of the integral multiples of the variable, but to the sines and cosines of the products of the variable and the roots of a certain transcendental equation. One sees in Fourier's work the origin of the theory of orthogonal

junctions which were further developed at the beginning of the 20th century by Fredholm in his well-known work on the theory of integral equations. Fourier's discoveries dominate the whole of mathematical physics; the applications and generalizations derived from his methods are far reaching.

The theory of the Fourier series has proved to be no less important in mathematical analysis than in physics. The history of its development during the past century is closely knit with the development of the theory of functions of a real variable. Fourier did not give a rigorous demonstration of his results; as was the custom of the time, they were based upon expansions of a purely formal value. In 1837, however, Lejeune Dirichlet gave a demonstration of Fourier's results that was thoroughly rigorous. Dirichlet's essential accomplishment consisted in introducing the idea of uniform convergence of a series, an idea of capital importance in analysis. Following Lejeune Dirichlet, the greatest geometers of the 19th century occupied themselves with perfecting the theory of the trigonometric series, i.e., of defining exactly the necessary and sufficient conditions that an arbitrary function must satisfy if it can be developed in a series of this nature, the coefficients being furnished by the very same formulae stated by Fourier. One important development is due to Riemann, who demonstrated that the convergence of Fourier's series for a given value of a variable depends only on the behaviour of the function in the immediate vicinity of that value. Riemann's theorem reduces the general problem of Fourier's series to the study of the behaviour of a function in the immediate vicinity of a point.

The latest development of the theory of trigonometric series can only be realized by a deeper study of the idea of an aggregate (*ensemble*) of points (see AGGREGATES, THEORY OF; POINT SETS). In the same way that Lejeune Dirichlet was inspired by the study of Fourier's series, to perfect his own theory of the continuity and uniform convergence of certain series, Georg Cantor, to complete this study, created and perfected the theory of point sets. He describes the aggregates, or sets of points, derived from different orders of a given aggregate or set, and explains that the numbering of these derived sets creates a new type of numbers, to which he gives the name *transfinite numbers*. Finally, he shows that, if one of these derived sets from the ensemble of discontinuities of the function comprises a finite number of terms, the trigonometric development is certainly unique. The works of Georg Cantor on the theory of aggregates had an important indirect repercussion on the theory of Fourier's series. They also suggested an exceedingly important question, that of the measure of a linear set of points. This problem of measurement was solved, precisely and definitely, by Emile Borel in 1897, when he described certain aggregates as "measurable aggregates" (*ensembles mesurables*) and which Henri Lebesgue later called *ensembles mesurables B*. This definition of measurable aggregates, or sets of points, has, as a consequence, the idea of aggregates, or sets of points, of zero measure. M. Henri Lebesgue has proposed to call a property "almost everywhere true" (*veri presque partout*) when it is true of all the points excluding those points of an aggregate of zero measure. This idea of an "almost everywhere true" property has been important in the recent development of certain trigonometric series.

It is chiefly Lebesgue's idea of the integral, an idea which directly attaches itself to the measurement of aggregates, that has originated the latest refinements in the theory of Fourier's series. The coefficients of the series are in fact determined by the definite integrals in which the differential element is equal to the product of the function which is to be represented and the sine or cosine. By replacing integrals according to Riemann's definition by the integrals as defined by Lebesgue, the field of continuous or discontinuous functions which can be described by trigonometric series is considerably extended. These works on the trigonometric series which have their origin in the integral of Lebesgue are too technical and too numerous to be discussed here. A very important work by Arnaud Denjoy, however, deserves attention. Thanks to a new generalization of the idea of the integral, which he has named "totalization," Denjoy has been able to solve the problem of the determination of coefficients of a trigonometric

series in a complete and definitive manner. At the moment that the series exists and represents a function, the coefficients can be obtained in every case by Fourier's formulae, on condition that the integrals figuring in these formulae are interpreted in the sense given them by Denjoy. This beautiful result definitely closes a series of researches which has extended over more than a century. More recent investigations on a summation of Fourier's series, in a case where the series are divergent, are based for the most part on the methods and the generalizations of Cesàro. For a more detailed study of these researches, see the memoir by Plancherel and the book by Emile Borel, *Leçons sur les séries divergentes*.

(E. Bo.)

FOURMIES, a town of northern France, in the department of Nord, on an affluent of the Sambre, 39 m. S.E. of Valenciennes by rail. Pop. (1926) 13,122. Wool combing and spinning are important, and a great variety of cloths is produced. The glass-works of Fourmies date from 1599, and were the first established in the north of France. Iron is worked in the vicinity, and there are important forges and foundries. Enamel-ware is also manufactured.

FOURNIER, PIERRE SIMON (1712-1768), French engraver and typefounder, was born at Paris on Sept. 15, 1712. He designed many new characters, and his foundry became celebrated not only in France, but in foreign countries. His *Table des proportions qu'il faut observer entre les caractères* (1737) was followed by several other technical treatises. His principal work, however, was the *Manuel typographique* (2 vols. 1764), the first volume treating of engraving and type-founding, the second of printing, with examples of different alphabets. He died in Paris on Oct. 8, 1768.

FOURTEEN POINTS, THE. On Jan. 8, 1918, President Woodrow Wilson, in his address to the joint session of Congress, formulated under 14 separate heads his ideas of the essential nature of a post-war settlement. Before the delivery of his address he had received from a committee of inquiry, set up by Col. House in Sept. 1917, a report upon the territorial settlement that should follow the conclusion of the war. It has been stated that no fewer than six, and these the territorial points, of Wilson's Fourteen Points were "directly framed" upon the recommendations contained in the report. It has also been stated that the report was drawn up by Dr. S. Mezes, D. H. Miller, and Walter Lippmann.¹

The Fourteen Points were:—

1. Open covenants of peace openly arrived at, after which there shall be no private international understandings of any kind, but diplomacy shall proceed always frankly and in the public view.
2. Absolute freedom of navigation upon the seas outside territorial waters alike in peace and in war, except as the seas may be closed in whole or in part by international action for the enforcement of international covenants.
3. The removal, so far as possible, of all economic barriers and the establishment of an equality of trade conditions among all the nations consenting to the peace and associating themselves for its maintenance.
4. Adequate guarantees given and taken that national armaments will be reduced to the lowest point consistent with domestic safety.
5. A free, open-minded and absolutely impartial adjustment of all colonial claims based upon a strict observance of the principle that in determining all such questions of sovereignty the interests of the populations concerned must have equal

¹R. S. Baker, *Woodrow Wilson*, vol. i., pp. 110-111.

weight with the equitable claims of the Government whose title is to be determined.

6. The evacuation of all Russian territory, and such a settlement of all questions affecting Russia as will secure the best and freest co-operation of the other nations of the world in obtaining for her an unhampered and unembarrassed opportunity for the independent determination of her own political development and national policy, and assure her of a sincere welcome into the society of free nations under institutions of her own choosing, and more than a welcome, assistance also of every kind that she may need and may herself desire. The treatment accorded Russia by her sister nations in the months to come will be the acid test of their good will, of their comprehension of her needs as distinguished from their own interests, and of their intelligent and unselfish sympathy.

7. Belgium, the whole world will agree, must be evacuated and restored without any attempt to limit the sovereignty which she enjoys in common with all other free nations. No other single act will serve as this will serve to restore confidence among the nations in the laws which they have themselves set and determined for the government of their relations with one another. Without this healing act the whole structure and validity of international law is for ever impaired.

8. All French territory should be freed, and the invaded portions restored, and the wrong done to France by Prussia in 1871 in the matter of Alsace-Lorraine, which has unsettled the peace of the world for nearly 50 years, should be righted in order that peace may once more be made secure in the interest of all.

9. A readjustment of the frontiers of Italy should be effected along clearly recognisable lines of nationality.

10. The peoples of Austria-Hungary, whose place among the nations we wish to see safeguarded and assured, should be accorded the freest opportunity of autonomous development.

11. Rumania, Serbia and Montenegro should be evacuated, occupied territories restored, Serbia accorded free and secure access to the sea, and the relations of the several Balkan States to one another determined by friendly counsel along historically established lines of allegiance and nationality, and international guarantees of the political and economic independence and territorial integrity of the several Balkan States should be entered into.

12. The Turkish portions of the present Ottoman empire should be assured a secure sovereignty, but the other nationalities which are now under Turkish rule should be assured an undoubted security of life and an absolutely unmolested opportunity of autonomous development, and the Dardanelles should be permanently opened as a free passage to the ships and commerce of all nations under international guarantees.

13. An independent Polish State should be erected which should include the territories inhabited by indisputably Polish populations, which should be assured a free and secure access to the sea, and whose political and economic independence and territorial integrity should be guaranteed by international covenant.

14. A general association of nations must be formed under specific covenants for the purpose of affording mutual guarantees of political independence and territorial integrity to great and small States alike.

President Wilson developed his theories during 1918 in a series of speeches, to which reference was subsequently made during the Armistice negotiations. These are as follows:—

The Four Principles.—In the "Four Principles" speech in Congress, Feb. 11, 1918, he declared:—

1. That each part of the final settlement must be based upon the essential justice of that particular case and upon such adjustments as are most likely to bring a peace that will be permanent;

2. That peoples and provinces are not to be bartered about from sovereignty to sovereignty as if they were chattels or pawns in a game, even the great game, now for ever discredited, of the balance of power; but that

3. Every territorial settlement involved in this war must be

made in the interest and for the benefit of the populations concerned, and not as a part of any mere adjustment or compromise of claims amongst rival States; and

4. That all well-defined national aspirations shall be accorded the utmost satisfaction that can be accorded them without introducing new or perpetuating old elements of discord and antagonism that would be likely in time to break the peace of Europe, and consequently of the world.

The Four Ends.—In the "Four Ends" speech of July 4, 1918, occurs the following passage:—

These are the ends for which the associated peoples of the world are fighting and which must be conceded them before there can be peace:—

1. The destruction of every arbitrary power anywhere that can separately, secretly, and of its single choice disturb the peace of the world, or, if it cannot be presently destroyed, at the least its reduction to virtual impotence.

2. The settlement of every question, whether of territory or sovereignty, of economic arrangement, or of political relationship, upon the basis of the free acceptance of that settlement by the people immediately concerned, and not upon the basis of the material interest or advantage of any other nation or people which may desire a different settlement for the sake of its own exterior influence or mastery.

3. The consent of all nations to be governed in their conduct towards each other by the same principles of honour and of respect for the common law of civilised society that govern the individual citizens of all modern States, and in their relations with one another, to the end that all promises and covenants may be sacredly observed, no private plots or conspiracies hatched, no selfish injuries wrought with impunity, and a mutual trust established upon the handsome foundation of a mutual respect for right.

4. The establishment of an organization of peace which shall make it certain that the combined power of free nations will check every invasion of right and serve to make peace and justice the more secure by affording a definite tribunal of opinion to which all must submit and by which every international readjustment that cannot be amicably agreed upon by the peoples directly concerned shall be sanctioned. These great objects can be put into a single sentence. *What we seek is the reign of law, based upon the consent of the governed and sustained by the organised opinion of mankind.*

The Five Particulars.—The "Five Particulars" (speech of Sept. 27, 1918) were:—

1. The impartial justice meted out must involve no discrimination between those to whom we wish to be just and those to whom we do not wish to be just. It must be a justice that plays no favourites and knows no standards but the equal rights of the several peoples concerned.

2. No special or separate interest of any single nation or any group of nations can be made the basis of any part of the settlement which is not consistent with the common interest of all.

3. There can be no leagues or alliances or special covenants and understandings within the general and common family of the League of Nations.

4. And, more specifically, there can be no special selfish economic combinations within the League and no employment of any form of economic boycott or exclusion, except as the power of economic penalty, by exclusion from the markets of the world, may be vested in the League of Nations itself as a means of discipline and control.

5. All international agreements and treaties of every kind must be made known in their entirety to the rest of the world. Special alliances and economic rivalries and hostilities have been the prolific source in the modern world of the plans and passions that produce war. It would be an insincere as well as an insecure peace that did not exclude them in definite and binding terms.

BIBLIOGRAPHY.—H. W. V. Temperley, *History of the Peace Conference of Paris*, vol. i., pp. 431-435 (1920); The text of the fourteen points will be found in C. Seymour, *Woodrow Wilson and the World War*, vol. iii., pp. 43-45 (1921). See also R. S. Baker, *Woodrow Wilson and World Settlement* (1923).

FOURTOU, MARIE FRANÇOIS OSCAR BARDY DE (1836–1897), French politician, born at Ribérac (Dordogne) on Jan. 3, 1836, represented Dordogne in the National Assembly after the Franco-German War. He was minister of public works (1872), of religion (1873) and of education (1874). As minister of the interior in Broglie's cabinet in 1877 he resumed the administrative methods of the Second Empire. In the general elections of that year he used the whole weight of officialdom to secure a majority for the Right, to support a clerical and reactionary programme. In spite of these efforts the cabinet fell, and a commission was appointed to inquire into their unconstitutional abuse of power. Fourtou was unseated in consequence of the revelations made. In the Chamber of Deputies Gambetta gave the lie direct to Fourtou. A duel was fought in consequence, but neither party was injured. Fourtou died in Paris on Dec. 5, 1897.

His works include *Histoire de Louis XVI.* (1840); *Histoire de Saint Pie V.* (1845); *Mme. Swetchine, sa vie et ses oeuvres* (2 vols., 1859); *La Question italienne* (1860); *De la contre-révolution* (1876); and *Mémoires d'un royaliste* (2 vols., 1888).

FOWEY (usually pronounced *Foy*), a seaport and town in Cornwall, England, 264½ m. W.S.W. of London on a branch of the G.W.R. from Lostwithiel, 25 m. by sea W. of Plymouth. Pop. (1931) 2,382. It lies on the estuary of the river Fowey, sheltered by a screen of hills. The 14th century church of St. Nicholas, on the site of an older edifice dedicated to St. Finbar of Cork, has many beautiful features. Place house, adjacent, is a Tudor building of the time of Henry VII. Some old houses remain in the town. Deep-sea fishing is carried on, and there is a staple trade in the export of china clay. Fowey harbour will admit large vessels and affords protection from the south-west gales. The ruin of St. Catherine's fort stands at the harbour's mouth. Connected with the town by ferry, is Polruan village, where there is an ancient roodstone, and the remains of Hall House, which was garrisoned during the Civil War.

Fowey (Fawy, Vawy, Fowyk) held a leading position amongst Cornish ports from the reign of Edward I. to the days of the Tudors. The numerous references to the privateering exploits of its ships in the Patent and Close Rolls and the large number of them (over 40) at the siege of Calais in 1346 testify to its importance. A charter of incorporation was granted by James II. and extended by a second charter in 1690. In 1316 the prior of Tywardreath, as lord of the manor, obtained the right to hold a Monday market and two fairs, which by the charter of 1690 were altered to a Saturday market and three fairs that continue to be held.

FOWL, originally used to mean any bird, this term has now become (except in combination, as sea-fowl, wildfowl) almost restricted to *Gallus gallus*, its domestic races and its wild allies. (For domestic fowls, see POULTRY.) The wild *G. gallus* inhabits N. India, Burma, Cochin China, the Malay peninsula and neighbouring islands. It resembles in plumage the domestic "black-breasted game" breed. It inhabits forests, thickets and bamboo jungles, dwelling in small parties. The crow of the cock is like that of a bantam. The creamy-white eggs, eight to 12 in number, are laid on the ground.

The grey jungle-fowl (*G. sonneratii*) occupies much the same habitat; it is found in western, central and southern India. The cock has the shaft of the neck-hackles dilated and his crow is more like a cackle. The Sinhalese species (*G. lafayetii*) is peculiar to Ceylon; the cock has a yellow comb with a red edge and is red beneath. The fourth species (*G. varius*) inhabits the Malay islands from Java to Flores. It does not possess hackles and the cock has a large unserrated comb. All the species will interbreed with domestic poultry and with the wild *G. gallus*, but the hybrids are sterile.

FOWLER, CHARLES (1792–1867), English architect, was born at Cullompton, Devon, on May 17, 1792, and died at Great Marlow on Sept. 26, 1867. After an apprenticeship of five years at Exeter, he worked in the office of David Laing in London from 1814 until he began to practise alone. His first important work was the court of bankruptcy in Basinghall street (1821). In 1822

he gained first premium for a design for London bridge, which, however, was not used. Among Fowler's designs for bridges was one erected across the Dart at Totnes. He also designed the markets of Covent Garden, Hungerford, Gravesend and Exeter (lower market); several churches, the Devon lunatic asylum (1845), the London fever hospital (1849) and the hall of the Wax Chandlers' company, Gresham street (1853). He was honorary secretary and a vice-president of the Institute of British Architects.

FOWLER, SIR JOHN (1817–1898), English civil engineer, was born on July 15, 1817 at Wadsley Hall, near Sheffield, where his father was a land-surveyor. He was engaged in railway construction from an early age, and when he set up in business for himself in 1844 he was engaged in laying out the small railway systems which eventually were amalgamated under the title of the Manchester, Sheffield and Lincolnshire railway. Fowler was engineer of the London Metropolitan railway, the pioneer of underground railways, and noteworthy in that it was mostly made, not by tunnelling, but by excavating from the surface and then covering in the permanent way; and he lived to be one of the engineers officially connected with the deep tunnelling "tube" system extensively adopted for electric railways in London. He was also engaged in the making of railways in Ireland, and in 1867 he served on a commission to consider a state-purchase of the Irish railway system. He also carried out considerable works in relation to the Nene Valley drainage and the reclamation of land at the Norfolk estuary.

In 1865 he was elected president of the Institution of Civil Engineers, the youngest president who had ever sat in the chair. He was strongly opposed to the project of a Channel tunnel to France, and in 1872 he endeavoured, in vain, to obtain the consent of parliament to a Channel ferry scheme. For eight years from 1871 he acted as general engineering adviser in Egypt to the Khedive Ismail. He projected a railway to the Sudan, and also the reparation of the barrage. These and many other plans came to an end owing to financial reasons. But the maps and surveys for the railway were given to the war office, and proved most useful to Lord Wolseley in his Nile expedition. For his service Fowler was made K.C.M.G. (1885). He was created a baronet in 1890 on the completion of the Forth bridge, of which with his partner Sir Benjamin Baker he was joint engineer. He died at Bournemouth on Nov. 20, 1898.

FOWLER, JOHN (1826–1864), English inventor, was born at Melksham, Wilts, on July 11, 1826. He invented, about 1850, a mechanical system for the drainage of land. In 1852 he began experiments in steam cultivation, and in 1858 the Royal Agricultural Society awarded him the prize of £500 for a steam-cultivator that should be an economic substitute for the plough or the spade. In 1860 he founded at Hunslet, Leeds, the firm of Fowler and Co., manufacturers of agricultural machinery, traction engines, etc. He died at Ackworth, Yorkshire, on Dec. 4, 1864.

FOWLER, THOMAS (1832–1904), English philosopher, was born on Sept. 1, 1832, at Burton-Stather, Lincs., and was educated at Merton college, Oxford. In 1855 he was ordained, and became fellow and tutor of Lincoln college, in 1873 professor of logic, in 1881 president of Corpus Christi college, and in 1899 vice-chancellor of the university, an office which he held for two years. He died at Oxford on Nov. 20, 1904.

Fowler's chief works are: *The Elements of Deductive Logic* (1867; 10th ed., 1892); *The Elements of Inductive Logic* (1870; 6th ed., 1892); *Locke* in "Eng. Men of Letters" series (1880); *Bacon's Novum Organum* (1889); *Locke's Conduct of the Understanding* (3rd ed., 1890); *Francis Bacon* (1881); *Shaftesbury and Hutcheson* in "Eng. Philosophers" series (1882); *History of Corpus Christi College* (1898), and *Principles of Morals* (1885–87) with J. M. Wilson.

FOWLER, WILLIAM (c. 1560–1614), Scottish poet, attended St. Leonard's college, St. Andrews, between 1574 and 1578, and in 1581 was in Paris studying civil law. In that year he issued a pamphlet against John Hamilton and other Catholics, who had, he said, driven him from his country. He subsequently (about 1590) became private secretary and Master of Requests

to Anne of Denmark, wife of James VI., and was renominated to these offices when the queen went to England. In 1609 his services were rewarded by a grant of 2,000 acres in Ulster. His sister Susannah was mother of the poet William Drummond of Hawthornden. A ms. collection of 72 sonnets, entitled *The Tarentula of Love*, and a translation (1537) from the Italian of the *Triumphs of Petrarke* are preserved in the library of the University of Edinburgh, in the collection bequeathed by his nephew, William Drummond. Two other volumes of his manuscripts are preserved among the Drummond mss., now in the library of the Society of Antiquaries of Scotland. Specimens of Fowler's verses were published in 1803 by John Leyden in his *Scottish Descriptive Poems*. Fowler contributed a prefatory sonnet to James VI.'s *Furies*; and James, in return, commended, in verse, Fowler's *Triumphs*.

FOX, CHARLES JAMES (1749-1806), British statesman and orator, was born at 9 Conduit Street, Westminster, on Jan. 24, 1749, third son of Henry Fox, 1st Lord Holland, and his wife, Lady Caroline Lennox, eldest daughter of Charles Lennox, 2nd duke of Richmond. The father, who treated his children with extreme indulgence, allowed him to choose his school, and he elected to go to one kept at Wandsworth by a French refugee, named Pampelonne. Then the boy asked to be sent to Eton, where he was entered in the autumn of 1758. During the six years he spent at Eton he acquired the love and knowledge of the classics in which he found refreshment and solace all through life. Lord Holland treated his children, and in particular Charles, as friends and companions in pleasure from the first. In 1763 he took Charles to Paris and to Spa, and encouraged him in dissipation and in gambling. In spite of this extraordinary interlude in his studies, Fox read hard from natural inclination. After he went up to Hertford College, Oxford, in 1764, he made repeated visits to France and Italy during the vacations. He became a good French and Italian scholar, with a keen appreciation of Italian literature and art.

If Fox's youth was disorderly, it was never indolent. He was incapable of half doing anything which he did at all. He was as energetic in sport as in learning. At a later period when he had grown fat he accounted for his skill in taking "cut balls" at tennis by saying that he was a very "painstaking man." He was all his life a great and steady walker.

In 1768 Lord Holland bought the pocket borough of Midhurst for him, and he entered on his parliamentary career, and on London society, in 1769. Within the next few years Lord Holland reaped to the full the reward for all that was good, and whatever was evil, in the training he had given his son. The affection of Charles Fox for his father was unbounded, but the passion for gambling which had been instilled in him as a boy proved the ruin of the family fortune. He kept racehorses, and bet on them largely. On the racecourse he was successful, and it is another proof of his native thoroughness that he gained a reputation as a handicapper. It is said that he won more than he lost on the course. At the gaming table he was unfortunate, and he was fleeced both in London and in Paris by unscrupulous players. Fox took his losses and their consequences with an attractive gaiety. He called the room in which he did business with the Jew money-lenders his "Jerusalem chamber." When his elder brother had a son, and his prospects were injured, he said that the boy was a second Messiah, who had appeared for the destruction of the Jews. "He had his jest, and they had his estate." In 1774 Lord Holland had to find £140,000 to pay the gambling debts of his sons. For years Charles lived in pecuniary embarrassment, and during his later years, when he had given up gambling, he was supported by the contributions of wealthy friends, who in 1793 formed a fund of £70,000 for his benefit.

Early Years in Parliament.—In the House of Commons he began by supporting the court; and in 1770, when only 21, he was appointed a junior lord of the admiralty with Lord North. During the violent conflict over the Middlesex election (see **WILKES, JOHN**) he took the unpopular side, and vehemently asserted the right of the House of Commons to exclude Wilkes. In 1772 during the proceedings against Crosby and Oliver—a part

of the "Wilkes and liberty" agitation—he and Lord North were attacked by a mob and rolled in the mud. But Fox's character was incompatible with ministerial service under King George III. The king, himself a man of orderly life, detested him as a gambler and a rake. And Fox was too independent to please a master who expected obedience. In Feb. 1772 he threw up his place to be free to oppose the Royal Marriage Act, on which the king's heart was set. He returned to office as junior lord of the treasury in December. But he was insubordinate; his sympathy with the American colonies, which were now beginning to resist the claims of the mother country to tax them, made him intolerable to the king and he was dismissed in Feb. 1774. The death of his father on July 1, of that year removed an influence which tended to keep him subordinate to the court, and his friendship for Burke drew him into close alliance with the Rockingham Whigs. From the first his ability had won him admiration in the House of Commons. He had prepared himself as an orator by the elaborate cultivation of his voice, which was naturally harsh and shrill. His argumentative force was recognized at once, but the full scope of his powers was first shown on Feb. 2, 1775, when he made a remarkable speech (unfortunately lost) on the disputes with the colonies. "Taking the vast compass of the question before us," says Gibbon, "he discovered powers for regular debate which neither his friends hoped nor his enemies dreaded." When parliament met on Oct. 26, Fox supported the amendment to the Address censuring ministers for increasing the discontent in America. "Ministers," he said, "have reason to triumph. Lord Chatham, the King of Prussia, nay, Alexander the Great, never gained more in one campaign than the noble lord [North] has lost—he has lost a whole continent." Next year, speaking again on the amendment to the Address (Oct. 31, 1776) he maintained that if the choice lay between conquering and abandoning America he was for abandoning it; the advantages of the connection arose from trade and from relationship with a people of the same ideas and sentiments. These would be cut off by war, and the army there would oppress the people and be dangerous to liberty at home.

Fox's great political career is unique among the careers of British statesmen of the first rank, for it was passed almost wholly in opposition. Except for a few months in 1782 and 1783, and again for a few months before his death in 1806, he was out of office. He declared, indeed, that he had "totally subdued" ambition, and was content with his life; yet it was certainly a cause of bitter disappointment to him that he had to stand by while the country was in his opinion not only misgoverned, but led to ruin. His reputation as an orator and a political critic, which was great from the first and grew as he lived, most assuredly did not console him for his impotence as a statesman.

During the eight years between his expulsion from office in 1774 and the fall of Lord North's ministry in March 1782 he planted the seed of the modern Liberal party as opposed to the pure Whigs. He became a member of the Rockingham party and worked in alliance with the marquis and with Burke. In opposing the attempt to coerce the American colonists, and in assailing the waste and corruption of Lord North's administration, as well as the undue influence of the crown, he was at one with the Rockingham Whigs. During the agitation against corruption, and in favour of honest management of the public money, which was very strong between 1779 and 1782, he and they worked heartily together. It had a considerable effect, and prepared the way for the reforms begun by Burke and continued by Pitt. But if Fox learnt much from Burke he learnt with originality. He declined to accept the revolution settlement as final, or to think with Burke that the constitution of the House of Commons could not be bettered. He believed that, if the House was to be made an efficient instrument for restraining the interference of the king and for securing good government, it must cease to be filled to a very large extent by the nominees of boroughmongers and the treasury. He became a strong advocate for parliamentary reform. He was the ardent advocate of what have in later times been known as "Liberal causes," the removal of all religious disabilities and tests, the suppression of private interests which

hampered the public good, the abolition of the slave trade, and the emancipation of all classes and races of men from the strict control of authority.

A detailed account of his activity from 1774 to 1782 would entail the mention of every crisis of the American War of Independence and of every serious debate in parliament. Throughout the struggle Fox was uniformly opposed to the coercion of the colonies and was the untiring critic of Lord North. While the result must be held to prove that he was right, he prepared future difficulties for himself by the fury of his language. He was the last man in the world to act on the worldly-wise maxim that an enemy should always be treated as if he may one day be a friend, and a friend as if he might become an enemy. At the opening of the autumn session in 1779 Fox, who was convinced that the king was responsible for North's continuance of the American War, stated plainly that the doctrine that the king could be his own minister was entirely unconstitutional and drew attention to the fate of Charles I. and James II. He denounced William Adam, a supporter of Lord North's, and in a duel which followed (Nov. 29) Fox was wounded. He assailed Lord North with unmeasured invective, directed not only at his policy but at his personal character, though he knew that the prime minister remained in office against his own wish, in deference to the king who appealed to his loyalty.

When the disasters of the American war had at last made a change of ministry necessary, and the king applied to the Whigs, through the intermediary of Shelburne, Fox made a very serious mistake in persuading Rockingham not to insist on dealing directly with the sovereign. The result was the formation of a cabinet (March 1782) belonging, in Fox's own words, partly to the king and partly to the country—that is to say, partly of Whigs who wished to restrain the king, and partly of the king's friends, represented by Shelburne, whose real function was to baffle the Whigs. Dissensions were acute between Shelburne and Fox, the two secretaries of state. The old division of duties by which the southern secretary had the correspondence with the colonies and the western powers of Europe, and the northern secretary with the others, had been abolished on the formation of the Rockingham cabinet. All foreign affairs were entrusted to Fox. Lord Shelburne, as secretary for the colonies, claimed a right to interfere in the negotiations for the peace at Paris, and fundamental differences arose. Fox thought the independence of America should be unconditionally acknowledged; Shelburne wished it to be the price of peace. The majority in the cabinet sided with Shelburne. Fox was about to resign, but resignation was deferred by the illness of Rockingham, who died on July 1, 1782. The king offered the premiership to Shelburne, Fox resigned, and was followed by a part of the Rockingham Whigs.

The 1783 Coalition.—Fox's next step was ruinous. On Feb. 14, 1783, he formed a coalition with Lord North, based as they declared on "mutual goodwill and confidence." Fox maintained that the original cause of quarrel, the American War, being over, there was no longer any serious ground of difference. But to the country at large this union, formed with a man whom he had denounced for years, had the appearance of an unscrupulous conspiracy. In the House of Commons the coalition was strong enough to drive Shelburne from office on Feb. 24. The king made a prolonged resistance to the pressure put on him to accept Fox and North as his ministers (*see* PITT, WILLIAM). On April 2, he was constrained to submit. In the new ministry the duke of Portland was prime minister and Fox and North were secretaries of state. The new administration was ill liked by some of the followers of both. Fox increased its unpopularity both in the House and in the country by consenting against the wish of most of his colleagues to ask for the grant of a sum of £100,000 a year to the prince of Wales. The introduction by Fox of the India bill in Nov. 1783 offended the king by the provision which gave the patronage of India to a commission to be named by the ministry and removable only by parliament. The coalition, and Fox in particular, were assailed in a torrent of most telling invective and caricature. George III. gave it to be understood that he would not look upon any member of the House of Lords who

voted for the India bill as his friend. The bill was thrown out in the upper House on Dec. 17, and next day the king dismissed his ministers.

Fox now went into opposition again. The remainder of his life may be divided into four portions—his opposition to Pitt during the session of 1784; his parliamentary activity till his secession in 1797; his retirement till 1800; his return to activity and his short tenure of office before his death in 1806. During the first of these periods he deepened his unpopularity by assailing the undoubted prerogatives of the crown, by claiming for the House of Commons the right to override not only the king and the Lords but the opinion of the country, and by resisting a dissolution. This last pretension came very ill from a statesman who in 1780 had advocated yearly elections. He lost ground daily before the steady good judgment and unblemished character of Pitt. When parliament was dissolved at the end of the session of 1784, the country showed its sentiments by unseating 180 of the followers of Fox and North. The defeated candidates were known as "Fox's martyrs."

Fox himself was elected for Westminster with fewer votes than Admiral Lord Hood, but with a majority over the ministerial candidate, Sir Cecil Wray. The election was marked by an amazing outflow of caricatures and squibs, by weeks of rioting in which Lord Hood's sailors fought pitched battles in St. James's Street with Fox's hackney coachmen, and by the intrepid canvassing of Whig ladies. The beautiful duchess of Devonshire (Georgiana Spencer) is said to have won at least one vote for Fox by kissing a shoemaker who had a romantic idea of what constituted a desirable bribe. The high bailiff refused to make a return, and the confirmation of Fox's election was delayed by the somewhat mean action of the ministry. He had, however, been chosen for Kirkwall, and could fight his cause in the House. In the end he recovered damages from the high bailiff. In his place in parliament he sometimes supported Pitt and sometimes opposed him with effect. His criticism on the ministers' bill for the government of India was sound in principle, though the evils he foresaw did not arise. His support of Pitt's Reform Bill was qualified by a just dislike of the ministers' proposal to treat the possession of the franchise by a constituency as a property and not as a trust. His unsuccessful opposition to the commercial treaty with France in 1787 was unwise and most injurious to himself. He committed himself to the proposition that France was the natural enemy of Great Britain, a saying often quoted against him in coming years. It has been excused on the ground that when he said France he meant the aggressive house of Bourbon.

In 1788 Fox travelled in Italy, with his faithful companion, Mrs. Armistead (Elizabeth Cane), but returned in haste on hearing of the illness of the king. Fox supported the claim of the prince of Wales to the regency as a right, a doctrine which provoked Pitt into declaring that he would "unwhig the gentleman for the rest of his life." The friendship between him and the prince of Wales (*see* GEORGE IV.) was always injurious to Fox. In 1787 he was misled by the prince's ambiguous assurances into denying the marriage with Mrs. Fitzherbert. On discovering that he had been deceived he broke off all relations with the prince for a year, but their alliance was renewed. During these years he was always in favour of whatever measures could be described as favourable to emancipation and to humanity. He actively promoted the impeachment of Warren Hastings, which had the support of Pitt. He was always in favour of the abolition of the slave trade (which he actually effected during his short tenure of office in 1806), of the repeal of the Test Acts, and of concessions to the Roman Catholics, both in Great Britain and in Ireland.

The French Revolution affected Fox profoundly. Together with almost all his countrymen he welcomed the meeting of the states-general in 1789 as the downfall of a despotism hostile to Great Britain. On hearing of the fall of the Bastille he wrote to Fitzpatrick: "How much the greatest event it is that ever happened in the world! and how much the best!" He continued to adhere stoutly to his opinion that the Revolution was essentially

just and ought not to be condemned for its errors or even for its crimes. As a natural consequence he was the steady opponent of Pitt's foreign policy, which he condemned as a species of crusade against freedom in the interest of despotism. Between 1790 and 1800 his unpopularity reached its height. He was left almost alone in parliament, and was denounced as the enemy of his country. On May 6, 1791, occurred the painful scene in the House of Commons, in which Burke renounced his friendship. In 1792 there was some vague talk of a coalition between him and Pitt, which came to nothing. The scene with Burke took place in the course of the debate on the Quebec Bill, in which Fox displayed real statesmanship by criticizing the division of Upper from Lower Canada, and other provisions of the bill, which in the end proved so injurious as to be unworkable. In this year he carried the Libel Bill. In 1792 his ally, the duke of Portland, and most of his party left him. In 1797 he withdrew from parliament, and only came forward in 1798 to reaffirm the doctrine of the sovereignty of the people at a great Whig dinner. On May 9 he was dismissed from the privy council.

The interval of secession (he and his friends ceased to attend parliament in 1797) was perhaps the happiest in his life. In company with Mrs. Armistead he established himself at St. Anne's Hill near Chertsey in Surrey. In 1795 he married her privately, but did not avow his marriage till 1802. Fox's time at St. Anne's was largely spent in gardening, in the enjoyment of the country, and in correspondence on literary subjects with his nephew, the 3rd Lord Holland, and with Gilbert Wakefield, the editor of Euripides. Greek and Italian were his first favourites, but he was well read in English literature and in French, and acquired some knowledge of Spanish. His favourite authors were Euripides, Virgil and Racine, whom he defends against the stock criticisms of the admirers of Corneille with equal zeal and insight.

Fox reappeared in parliament (Feb. 3, 1800) to take part in the vote of censure on ministers for declining Napoleon's overtures for a peace. The fall of Pitt's first ministry and the formation of the Addington cabinet, the peace of Amiens, and the establishment of Napoleon as first consul with all the powers of a military despot, seemed to offer Fox a chance of resuming power in public life. The struggle with Jacobinism was over, and he could have no hesitation in supporting resistance to a successful general who ruled by the sword, and who pursued a policy of perpetual aggression. During 1802 he visited Paris.

The death of Pitt (1806) left Fox so manifestly the foremost man in public life that the king could no longer hope to exclude him from office. The formation of a ministry was entrusted by the king to Lord Grenville, but when he named Fox as his proposed secretary of state for foreign affairs George III. accepted him without demur. Indeed his hostility seems to a large extent to have died out. A long period of office might now have appeared to lie before Fox, but his health was undermined. Had he lived it may be considered as certain that the war with Napoleon would have been conducted with a vigour which was much wanting during the next few years. In domestic politics Fox had no time to do more than insist on the abolition of the slave trade. He, like Pitt, was compelled to bow to the king's invincible determination not to allow the emancipation of the Roman Catholics. When a French adventurer calling himself Guillet de la Gevriillière, whom Fox at first "did the honour to take for a spy," came to him with a scheme for the murder of Napoleon, he sent a warning on Feb. 20, to Talleyrand. The incident gave him an opportunity for reopening negotiations for peace. A correspondence ensued, and British envoys were sent to Paris. But Fox was soon convinced that the French ministers were playing a false game. He was resolved not to treat apart from Russia, then the ally of Great Britain, nor to consent to the surrender of Sicily, which Napoleon insisted upon, unless full compensation could be obtained for King Ferdinand. The later stages of the negotiation were not directed by Fox, but by colleagues who took over his work at the foreign office when his health began to fail in the summer of 1806. After carrying his motion for the abolition of the slave trade on June 10, he was forced to give up attendance in parliament, and he died (of dropsy) in the house of the duke

of Devonshire, at Chiswick, on Sept. 13, 1806. His wife survived him till July 8, 1842. No children were born of the marriage. Fox is buried in Westminster Abbey by the side of Pitt.

The striking personal appearance of Fox has been rendered very familiar by portraits and by innumerable caricatures. The latter were no doubt deliberately exaggerated, and yet a comparison between the head of Fox in Sayer's plate "Carlo Khan's triumphal entry into Leadenhall," and in Abbot's portrait, shows that the caricaturist did not depart from the original. Fox was twice painted by Sir Joshua Reynolds, once when young in a group with Lady Sarah Bunbury and Lady Susan Strangeways, and once at full length. A half-length portrait by the German painter, Karl Anton Hickel, is in the National Portrait Gallery, where there is also a terra-cotta bust by Nollekens.

(D. H.; X.)

FOX, EDWARD (c. 1496-1538), bishop of Hereford, was born at Dursley, Gloucestershire; he is said on very doubtful authority to have been related to Richard Fox (q.v.). From Eton he proceeded to King's College, Cambridge, and after graduating was made secretary to Wolsey. In 1528 he was sent with Gardiner to Rome to obtain from Clement VII. a decretal commission for the trial and decision of the case between Henry VIII. and Catherine of Aragon. On his return he was elected provost of King's College, and in Aug. 1529 conveyed to the king Cranmer's historic advice that he should apply to the universities of Europe rather than to the pope. After a brief mission to Paris in Oct. 1529, Fox in Jan. 1530 befriended Latimer at Cambridge, and took an active part in persuading that university and Oxford to decide in the king's favour. He was sent to employ similar methods of persuasion at the French universities in 1530-31, and was also engaged in negotiating a closer league between England and France. In April 1533 he was prolocutor of convocation when it decided against the validity of Henry's marriage with Catherine, and in 1534 published his treatise *De vera differentia regiae potestatis et ecclesiae* (2nd ed. 1538, Eng. tr. 1548). He received the archdeaconry of Leicester (1531) and the bishopric of Hereford (1535). In 1535-36 he was sent to Germany to discuss the basis of a political and theological understanding with the Lutheran princes and divines, and had several interviews with Luther, who could not be persuaded of the justice of Henry VIII.'s divorce. Bucer dedicated to him in 1536 his *Commentaries on the Gospels*, and Fox's Protestantism was also illustrated by his patronage of Alexander Aless, whom he defended before Convocation. Fox died on May 8, 1538. He was the most Lutheran of Henry VIII.'s bishops, and was largely responsible for the Ten Articles of 1536.

FOX, GEORGE (1624-91) was born in 1624 at Drayton in Leicestershire, the son of a weaver. As a child he was unusually serious and sensitive to right and wrong. His relatives thought of educating him as a clergyman, but he was eventually apprenticed to a shoemaker and grazier. After a time he felt that the command of God was for him to leave his family and friends and go forth alone and he went on a series of journeys visiting preachers in search of spiritual guidance.

The influence of his remarkable personality soon made itself felt. The mysticism of Fox was positive and practical; leading him at the outset of his ministry to denounce all kinds of social evils.

In 1647 he began a peripatetic ministry which continued till the closing years of his life, broken by intervals of imprisonment. He was first imprisoned in 1649 at Nottingham, for interrupting a sermon by an impetuous appeal from the Scriptures to the Holy Spirit as the authority and guide. In 1650 he was committed to Derby gaol as a blasphemer, and at Derby, the nickname of Quakers was given to Fox and his friends by Justice Gervase Bennett. But Fox won such esteem that while still in gaol he was

offered a captaincy in the Parliamentary army which he declined.

He bore his frequent sufferings and hardships with great courage and found a wide response to his appeal, especially in the north-west of England, among companies of "Seekers." By 1651 other Quaker preachers joined him in his service. The centre of the movement was for some years at Swarthmore Hall, near Ulverstone, the home of Judge Fell, Cromwell's chancellor of the duchy of Lancaster, who was friendly to the Quakers, while his wife, Margaret, joined them.

He spent six years in various prisons, at Nottingham (1649), Derby (1650-51), Carlisle (1653), Launceston (1656), Lancaster and Scarborough (1664-66) and Worcester (1673-75), sometimes amid terrible conditions. Throughout his active ministry he found time to issue numerous books and pamphlets. His style was uncouth, his grammar and spelling often faulty, but amid occasional obscurities and repetitions pregnant phrases occur, while his *Journal* often shows striking power of narrative. Recent research has shown that he was more widely read than has been supposed. But it was his presence and spoken words which made the deep impression vividly portrayed in Penn's preface to his *Journal*, winning universal respect, affection and attention.

By 1666 his strong frame was shattered by severe imprisonment, and henceforth much of his time was given to building up the Quaker community in a church order, which offered freedom of service to men and women and at the same time gave expression to the group spirit. Fox also took care to institute careful provision for the poor and for the accurate registration of births, deaths and marriages.

In 1669 he married Margaret, the widow of Judge Fell, but continued his travelling mission, visiting the West Indies and America in 1671-72, Holland and north Germany in 1677, and Holland again in 1681. After his long imprisonment at Worcester, he stayed to recuperate at Swarthmore Hall (1675-77), and resided there once again in 1678-80, making use of this time to arrange his papers and prepare his *Great Journal*. But feeling still the call to a wider service, he went south again, his later years being passed chiefly in and around London, where his wife came at intervals to stay with him.

Notwithstanding failing health he still kept at work, visiting Quaker meetings and families, promoting the establishment of schools, corresponding with the Quaker communities abroad, advising his fellow Quakers in difficulties great and small and even interviewing members of parliament to help in the framing of the Toleration Act. He died on Jan. 13, 1691.

Fox's *Journal*, the work by which he is principally known, was printed in 1694, being edited from his papers by Eliwood. The complete *Journal* was edited verbatim in 1911 by Norman Penney, and the *Short Journal* and itinerary journals in 1925. Folio volumes of Fox's epistles and doctrinal works were issued in 1698 and 1706. In 1852 an edition of his works in eight volumes was published in Philadelphia, but no complete collection has yet been printed.

For Fox's life see Thos. Hodgkin's *George Fox* (1896) and A. N. Brayshaw's *The Personality of George Fox* (1919). (T. E. H.)

FOX, RICHARD (c. 1448-1528), successively bishop of Exeter, Bath and Wells, Durham and Winchester, lord privy seal, and founder of Corpus Christi College, Oxford, was born about 1448 at Ropesley, near Grantham, Lincolnshire. His parents belonged to the yeoman class, and there is some obscurity about Fox's early career. He probably studied at Magdalen college, Oxford, whence he drew so many members of his subsequent foundation, Corpus Christi. He also appears to have studied at Cambridge. In 1484 he was in Paris, where he met the earl of Richmond (the future Henry VII.) and was taken into his service. In January 1485 Richard intervened to prevent Fox's appointment to the vicarage of Stepney on the ground that he was keeping company with the "great rebel, Henry ap Tudor."

On Henry's accession Fox became the King's principal secretary, and soon afterwards lord privy seal and bishop of Exeter (1487). The ecclesiastical preferment was merely intended to provide a salary not at Henry's expense; for Fox never saw either Exeter or the diocese of Bath and Wells to which he was translated in 1492. His work was political and especially diplomatic. In 1487 he negotiated a treaty with James III. of Scotland, in

1492 he helped to conclude the treaty of Étampes, and in 1497 he was chief commissioner in the negotiations for the famous commercial agreement with the Netherlands, the *Magnus Intercursus*.

Meanwhile in 1494 Fox had been translated to the see of Durham, which was of political importance as a palatine earldom and because of its position with regard to the Borders and relations with Scotland. Fox therefore visited and resided in his new diocese; and he occupied Norham castle, which he fortified and defended against a Scottish raid in Perkin Warbeck's interests (1497). But his energies were principally devoted to pacific purposes. In that same year he negotiated Perkin's retirement from the court of James IV., and in 1498-1499 he completed the negotiations for that treaty of marriage between the Scottish king and Henry's daughter Margaret which led ultimately to the union of the two crowns in 1603 and of the two kingdoms in 1707. The marriage itself did not take place until 1503.

This consummated Fox's work in the north, and in 1501 he was translated to Winchester, then reputed the richest bishopric in England. In that year he concluded the negotiations for the betrothal of Prince Arthur to Catherine of Aragon. He also arranged the betrothal of the king's younger daughter Mary to the future emperor Charles V. In 1500 he was elected chancellor of Cambridge university, and in 1507 master of Pembroke hall in the same university. The Lady Margaret Beaufort made him one of her executors, and with Fisher, he was principally responsible for the foundation of St. John's college and the Lady Margaret professorships and readerships.

His financial work brought him a less enviable notoriety, though a curious freak of history has deprived him of the credit which is his due for "Morton's fork." The invention of that ingenious dilemma for extorting contributions from poor and rich alike is ascribed as a tradition to Morton by Bacon; but the story is told in greater detail of Fox by Erasmus, who says he had it from Sir Thomas More, a well-informed contemporary authority.

Under Henry VIII. the personnel of the ministry at first remained unaltered. The Venetian ambassador calls Fox *alter rex* and the Spanish ambassador Carroz says that Henry VIII. trusted him more than any other adviser, although he also reports Henry's warning that the bishop of Winchester was, as his name implied, "a fox indeed." Wolsey's rapid rise in 1511 put an end to Fox's influence. The pacific policy of the first two years of Henry VIII.'s reign was succeeded by an adventurous foreign policy directed mainly against France; and Fox, who desired peace, complained that no one durst do anything in opposition to Wolsey's wishes. Gradually Warham and Fox retired from the government; the occasion of Fox's resignation of the privy seal was Wolsey's ill-advised attempt to drive Francis I. out of Milan by financing an expedition led by the emperor Maximilian in 1516. Tunstall protested, Wolsey took Warham's place as chancellor, and Fox was succeeded by Ruthal, who, said the Venetian ambassador, "sang treble to Wolsey's bass." He bore Wolsey no ill-will, and warmly congratulated him two years later when warlike adventures were abandoned at the peace of London. But in 1522 when war was again declared he refused to bear any part of the responsibility, and in 1523 he opposed in convocation the financial demands which met with a more strenuous resistance in the House of Commons.

He now devoted himself assiduously to his long-neglected episcopal duties. His sight failed during the last ten years of his life. The crown of Fox's career was his foundation (1515-16) of Corpus Christi college. Originally he intended it as an Oxford house for the monks of St. Swithin's, Winchester; but he is said to have been dissuaded by Bishop Oldham, who denounced the monks and foretold their fall. The scheme adopted breathed the spirit of the Renaissance; provision was made for the teaching of Greek, Erasmus lauded the institution and Pole was one of its earliest fellows. The humanist Vives was brought from Italy to teach Latin, and the reader in theology was instructed to follow the Greek and Latin Fathers rather than the scholastic commentaries. Fox also built and endowed schools at Taunton and Grantham, and was a benefactor to numerous other institutions. He died at Wolvesey on Oct. 5, 1528; Corpus possesses several portraits and

other relics of its founder.

Church in the 16th Cent.* (1899); A. F. Pollard, *Henry VIII.* (1905); Longman, *Political History*, vol. v. (1905); other authorities cited in the article by T. Fowler (formerly president of Corpus) in the *Dict. Nat. Biog.*

FOX, ROBERT WERE (1789-1877), English geologist, was born at Falmouth on April 26, 1789. He made researches on the internal temperature of the earth, being the first to prove that the heat increased definitely with the depth; his observations being conducted in Cornish mines from 1815 for a period of forty years. In 1829 he commenced a series of experiments on the artificial production of miniature metalliferous veins by means of the long-continued influence of electric currents, and his main results were published in *Observations on Mineral Veins* (*Rep. Royal Cornwall Polytech. Soc.*, 1836). He constructed in 1834 an improved form of deflector dipping needle. In 1848 he was elected F.R.S. He died on July 25, 1877. (See *A Catalogue of the Works of Robert Were Fox, F.R.S., with a Sketch of his Life*, by J. H. Collins, 1878.)

His daughter, **CAROLINE FOX** (1819-1871), born at Falmouth on May 24, 1819, wrote a diary recording memories of many distinguished people, including John Stuart Mill, John Sterling and Carlyle. Selections from her diary and correspondence (1835-71) were published under the title of *Memories of Old Friends* (ed. by H. N. Pym, 1881; 2nd ed., 1882). She died on Jan. 12, 1871.

FOX, SIR STEPHEN (1627-1716), English statesman, born on March 27, 1627, was the son of William Fox, of Farley in Wiltshire, a yeoman farmer. At 15 he entered the service of the earl of Northumberland; then he entered the service of Lord Percy, the earl's brother, and was present with the royalist army at the battle of Worcester (Sept. 3, 1651) as Lord Percy's deputy at the ordnance board. Accompanying Charles II. in his flight to the continent, he was appointed manager of the royal household, on Clarendon's recommendation. He was employed on several important missions, and acted eventually as intermediary between the king and General Monk. After the Restoration he was appointed to the lucrative offices of first clerk of the board of green cloth and paymaster-general of the forces. He entered parliament in 1661, was knighted (1665), and was a commissioner of the treasury from 1679 to 1702. In 1680 he resigned the paymastership and was made first commissioner of horse. In 1684 he became sole commissioner of horse. He was offered a peerage by James II., on condition of turning Roman Catholic, but refused. In 1685 he was again M.P. for Salisbury and opposed the bill for a standing army supported by the king. During the Revolution he maintained an attitude of decent reserve, but was confirmed in his offices by William III. He died on Oct. 28, 1716. He contributed £13,000 to Chelsea hospital, the military pensioners' home founded by Charles II. He grew rich in the service of the nation without being suspected of corruption, and without forfeiting the esteem of his contemporaries.

His elder son by his second marriage, with Christian Hopes, **Stephen** (1704-1776), was created Lord Ilchester and Stavordale in 1747 and earl of Ilchester in 1756; in 1758 he took the additional name of Strangways, and his descendants, the family of Fox-Strangways, still hold the earldom of Ilchester. The younger son, Henry, became the 1st Lord Holland (q.v.).

See *Memoirs of the Life of Sir Stephen Fox*, 1st. (1717, reprinted 1807 and 1811); and, for Lord Ilchester, *Letters to Henry Fox, Lord Holland, with a few addressed to his brother Stephen, Earl of Ilchester* (ed. Earl of Ilchester, 1915).

FOX, SIR WILLIAM (1812-93), New Zealand statesman, was born in England on June 9, 1812, and educated at Wadham college, Oxford. He was called to the bar in 1842, but immediately emigrated to New Zealand, where, in 1843, he became the New Zealand company's agent for the South Island. In 1848 Fox became attorney-general, but gave up the post to join in the agitation for a free constitution. In 1850 he came to London as political agent to urge the demands of the Wellington settlers, but the Colonial Office refused to recognise him. When government by responsible ministers was initiated in 1856, Fox ousted

the first ministry and formed a cabinet, holding office for 13 days. In 1861 he became premier for nearly 13 months, and in 1863 again took office with Sir Frederick Whitaker as premier. Fox's third premiership was from 1869 to 1872, and his fourth for five weeks in March-April 1873. Soon afterwards he left politics, though he led the attack which overthrew Sir George Grey's ministry in 1879. He lost his seat in the dissolution which followed in that year, and did not again enter parliament. He was an active champion of self-government for the New Zealand colonists, and laboured to secure their just rights for the Maori races, and to establish peace among the tribes. Sir William Fox was made K.C.M.G. in 1880. He died on June 23, 1893.

He published *The Six Colonies of New Zealand* (1851); and *The War in New Zealand* (1860, later ed., 1866).

FOX (female, vixen), primarily the popular name for the European species of the dog-family (*Canidae*) which by Linnaeus was named *Canis vulpes*; but by modern zoologists this species and others related to it are assigned to the genus *Vulpes*, because the nasal passages do not open into hollow spaces of the frontal bones as they do in *Canis* and its allies, and the postorbital processes are flat or hollowed instead of convex.

The typical fox (*Vulpes vulpes*) differs from other foxes in having a white "tag" to the tail combined with black on the backs of the ears—as thus defined the species has a wide geographical range, embracing practically the whole of Europe, Africa north of the Sahara, the whole of temperate Asia and North America as far south as Mexico. It has adapted itself to the most varied physical conditions and has become differentiated into a large number of local races or subspecies differing in size, colour, thickness of coat and other respects. There are too many to mention in detail; but the little fox (*V. v. leucopus*) of the plains of north-west India is of interest as illustrating the general principle that the southern races are smaller than the northern, the Himalayan fox (*V. v. montana*) and the Egyptian fox (*V. v. aegyptiaca*) being intermediate in size between it and the European race. In the matter of coat the finest foxes come from the far north. The typical colour of the species is reddish, grizzled with grey or buff, desert forms being paler than others; but the prevalent tint varies from fiery red to black, melanism being of frequent occurrence. In the North American race (*V. v. fulva*) for instance, there are three main varieties, the red, the cross and the silver, the cross fox being intermediate between the other two. The silver, a black fox sprinkled with white, provides valuable furs; but the price is likely to decline owing to the success that is being achieved by breeding these animals in fox farms. Most of the red fox skins on the market come from Australia where European foxes were introduced years ago to check the rabbit plague.

Habits of the Fox.—So far as is known the habits of the common fox vary in no important respect wherever it is found. It is a predacious, mostly nocturnal animal, feeding principally upon small birds and mammals but taking frogs, shell-fish, insects and even fruit at times. The sexes live apart except at the pairing season, which occurs early in the year; and, after a gestation period of about 63 days, the vixen brings forth her litter of four or a few more young in a burrow or natural crevice, in the spring. Only one litter is produced in the year and the young, which are blind for about ten days, are able to shift for themselves by the autumn and become adult when about a year old. Foxes do not hibernate and are as active in winter as in summer even in the coldest latitudes. Accounts of hybrids between dogs and foxes have often been published; but there is no authenticated case known and specimens never come to hand for expert examination when demanded.

Foxes are noted for the cunning they evince in the avoidance of traps and, in countries where they are hunted by hounds, for the methods they adopt in breaking the line of scent left by their footfall on the soil, even by leaping on to the backs of sheep. Since foxes have no natural enemies other than man to trap and pursue them in that way, it has been suggested that their devices are due to instinct engendered by man's persecution continued generation after generation. But all the indications of the cleverness of foxes cannot be explained in that way. The means

they adopt to rid themselves of fleas is a case in point. Taking in his mouth a tuft of wool or a piece of wood, a fox will slowly sink himself, tail first, into a pond and thus gradually drive the fleas forward until their last refuge is the wool or wood on the surface of the water. The fox then sets this adrift teeming with the parasites and keeping clear of it lands on the bank and makes off. The origin of this habit, which can hardly be regarded as of survival value, is at present beyond our understanding.

No other species of *Vulpes* has a range comparable in extent to that of the species just described. A few only occur in the same latitudes, namely the small corsac fox (*V. corsac*) of Amurland, the tiny little fox (*V. cana*) of Baluchistan, the peculiar Tibetan fox (*V. ferrilatus*), which has short ears and round pupils, and the kit fox (*V. velox*) of the United States. Most are more southern in their range, such as the common Indian fox (*V. bengalensis*), the fennecs (*V. fennecica* and *V. zerda*) of the Sahara and the South African fox (*V. chama*). There are no foxes in south-eastern Asia, south of China; and the only animal in Central America and the northern part of South America that deserves the name is the grey fox (*Urocyon cinereo-argenteus*), placed in a different genus on account of certain cranial peculiarities and the presence of an erectile crest along the spine. The other so-called South American foxes have the characteristics of *Canis* not of *Vulpes*; and the South African Delalande's fox (*Otocyon megalotis*) differs entirely in dentition from both these genera. Mainly to the north of the distributional area of the typical fox but overlapping it in parts of its range occurs the circumpolar Arctic fox (*Alopex lagopus*) which is represented by many local races. This species has the cranial characteristics of *Vulpes* but in some other respects is intermediate between that genus and *Canis*. One of the colour phases of this fox, known in the fur trade as the "blue" fox, is a permanent melanic variety which does not turn white in winter. The normal variety turns white like the Arctic hare, at that season, but is grizzled brown with white under parts in summer. (See CARNIVORA.)

(R. I. P.)

FOXES, JOHN (1516-1587), the author of the famous *Book of Martyrs*, was born at Boston, Lincolnshire. At the age of 16 he is said to have entered Brasenose college, Oxford. His authenticated connexion at the university is, however, with Magdalen college, of which he became a fellow in 1539, resigning in 1545. Soon after leaving Oxford he married Agnes Randall. After holding two tutorships he was driven from England by the accession of Mary, and he retired to Strasbourg, where he occupied himself with a Latin history of the Christian persecutions, which he had begun at the suggestion of Lady Jane Grey. This book, dealing chiefly with Wycliffe and Huss, and coming down to 1500, formed the first outline of the *Actes and Monuments*. It was printed by Wendelin Richelius with the title of *Commentarii rerum in ecclesia gestarum* (Strasbourg, 1554). In the same year Foxe moved to Frankfurt, where he found the English colony of Protestant refugees divided into two camps, the Calvinists and the Anglicans, and made a vain attempt to frame a compromise. He moved (1555) to Basle, where he worked as printer's reader to Johann Herbst or Oporinus. He made steady progress with his great book as he received reports from England of the religious persecutions there, and he issued from the press of Oporinus his pamphlet *Ad inclytos ac praeputentes Angliae proceres . . . supplicatio* (1557), a plea for toleration addressed to the English nobility. In 1559 he completed the Latin edition of his martyrology and returned to England. He lived for some time at Aldgate, London, in the house of his former pupil, Thomas Howard, now duke of Norfolk, and became associated with John Day the printer, himself once a Protestant exile. Foxe was ordained priest by Edmund Grindal, bishop of London, in 1560, and besides much literary work he occasionally preached at Paul's Cross and other places. His work had rendered great service to the Government, and he might have had high preferment in the church but for the Puritan views which he consistently maintained. He held, however, the prebend of Shipton in Salisbury cathedral, and is said to have been for a short time rector of Cripplegate.

In 1563 was issued from the press of John Day the first Eng-

lish edition of the *Actes and Monuments of these latter and perilous Dayes . . . by John Foxe*, commonly known as the *Book of Martyrs*. Its popularity was immense and signal. The Marian persecution was still fresh in men's minds, and the graphic narrative intensified in its numerous readers the fierce hatred of Spain and of the Inquisition which was one of the master passions of the reign. Nor was its influence transient. For generations the popular conception of Roman Catholicism was derived from its bitter pages. Its accuracy was immediately attacked by Catholic writers, notably in the *Dialogi sex* (1566). These criticisms induced Foxe to produce a second corrected edition, *Ecclesiastical History, containing the Actes and Monuments of things passed in every kynges tyme . . .* in 1570, a copy of which was ordered by Convocation to be placed in every collegiate church. Anthony à Wood says that Foxe "believed and reported all that was told him." There is no doubt that he was only too ready to believe evil of the Catholics, and he cannot always be exonerated from the charge of wilful falsification of evidence. It should, however, be remembered in his honour that his advocacy of religious toleration was far in advance of his day. He pleaded for the despised Dutch Anabaptists, and remonstrated with John Knox on the rancour of his *First Blast of the Trumpet*. Foxe was one of the earliest students of Anglo-Saxon, and he and Day published an edition of the Saxon gospels under the patronage of Archbishop Parker. He died on April 18, 1587 and was buried at St. Giles's, Cripplegate.

A list of his Latin tracts and sermons is given by Wood, and others, some of which were never printed, appear in Bale. Four editions of the *Actes and Monuments* appeared in Foxe's lifetime. The 8th edition (1641) contains a memoir of Foxe purporting to be by his son Samuel, the ms. of which is in the British Museum (Lansdowne ms. 388). Samuel Foxe's authorship is disputed, with much show of reason, by Dr. S. R. Maitland, *On the Memoirs of Foxe ascribed to his Son* (1841). The best-known modern edition of the Martyrology is that (1837-41) by the Rev. Stephen R. Cattley, with an introductory life by Canon George Townsend. The numerous inaccuracies of this life and the frequent errors of Foxe's narrative were exposed by Dr. Maitland in a series of tracts (1837-42), collected (1841-42) as *Notes on the Contributions of the Rev. George Townsend, M.A. . . . to the New Edition of Foxe's Martyrology*. The criticism lavished on Cattley and Townsend's edition led to a new one (1846-49) under the same editorship. A new text prepared by the Rev. Josiah Pratt was issued (1870) in the "Reformation Series" of the *Church Historians of England*, with a revised version of Townsend's *Life* and appendices giving copies of original documents. Later edition by W. Grinton Berry (1907).

Foxe's papers are preserved in the Harleian and Lansdowne collections in the British Museum. Extracts from these were edited by J. G. Nichols for the Camden Society (1859). See also W. Winters, *Biographical Notes on John Foxe* (1876); J. Gairdner, *The English Church in the Sixteenth Century* (1902).

FOXGLOVE, a genus of biennial and perennial plants of the family Scrophulariaceae and known botanically as *Digitalis*. It contains 25 species found in Europe, western Asia and the Canary Islands. The common or purple foxglove, *D. purpurea*, is common in dry hilly pastures and rocky places and by road-sides in various parts of Europe; it ranges in Great Britain from Cornwall and Kent to Orkney, and is sparingly naturalized in North America. It flourishes best in siliceous soils, and is not found in the Jura and Swiss Alps. Its characters are: stem erect, roundish, downy, leafy below, and from 18 in. to 5 ft. or more in height; leaves alternate, ovate or elliptic oblong, and dull green, with the under surface downy and paler than the upper; root of numerous, slender, whitish fibres; flowers $1\frac{1}{4}$ -2 $\frac{1}{2}$ in. long, pendulous, on one side of the stem, purplish crimson, and hairy and marked with eye-like spots within; corolla bell-shaped with a broadly two-lipped obtuse mouth, the upper lip entire or obscurely divided; stamens four, two longer than the other two (*didynamous*); capsule ovate and pointed; and seeds numerous, small. It normally flowers in July, and ripens its seed in August, but may occasionally be found in blossom as late as September. Many varieties have been raised by cultivation, with flowers varying in colour from white to deep rose and purple.

The foxglove, probably from folk's-glove (*i.e.*, fairies' glove), is known by a great variety of popular names in Britain. In the south of Scotland it is called bloody fingers; farther north, dead-

men's-bells; and on the eastern borders, ladies' thimbles, wild mercury and Scotch mercury. In Ireland it is generally known as fairy thimble. Among its Welsh synonyms are *menyg-ellyllon* (elves' gloves), *menyg y llwynog* (fox's gloves), *bysedd cockion* (redfingers) and *bysedd y cwm* (dog's fingers). In France its designations are *gants de notre dame* and *doigts de la Vierge*. The German name *Fingerhut* (thimble) suggested to Fuchs, in 1542, the employment of the Latin adjective *digitalis* as a designation for the plant. Other species of *Digitalis* although found in botanical collections are not generally grown. For medicinal uses see DIGITALIS.

FOX-HUNTING: see HUNTING.

FOX INDIANS, the name, from one of their clans, of an Algonkin tribe, whose former range was central Wisconsin. They call themselves Musk-wakiuk, "red earth people." Owing to heavy losses in their wars with the Ojibways and the French, they allied themselves with the Sauk tribe about 1780, the two tribes being now one.

FOXTAIL GRASS, the name given to perennial grasses of the genus *Alopecurus*, comprising about 30 species, natives of cool north temperate regions. Of these the meadow foxtail (*A. pratensis*) is extensively cultivated in Europe as a pasture grass, and is also naturalized in North America. Various species of *Setaria* are likewise called foxtail grass, of which the yellow foxtail (*S. glauca*) and the green foxtail (*S. viridis*), widely naturalized from Europe in North America, are often troublesome weeds. (See GRASSES.)

FOX-TROT, a modern dance of smooth, easy movement resembling a walk taken with long, rather springy steps, with knees slightly bent. Many variations are introduced. The music is in $\frac{4}{4}$ time. (See also DANCE.)

FOY, MAXIMILIEN SÉBASTIEN (1775–1825), French general and statesman, was born at Ham, Picardy, on Feb. 3, 1775, and educated at the college of Soissons, passing to the artillery school of La Fère. After his first campaign in Flanders (1791–92) he attained captain's rank, and served under Dampierre, Jourdan, Pichegru and Houchard. In 1794 he was imprisoned by the Convention, but released on the fall of Robespierre. He distinguished himself in Moreau's campaigns of 1796–97, and in the Swiss campaign of 1798, winning the rank of *chef de brigade* under Masséna in 1799. In 1800 he served in the Marengo campaign. Foy's opposition, as a republican, to the rise of Napoleon, and his vote against the establishment of the empire led to his joining the army in Holland. In 1807 he took part in the defence of the Dardanelles against the English, and later served throughout the Peninsular War. He won the rank of general under Junot, and served under Soult and Masséna. Napoleon, to whom Masséna sent him on a mission, made him a general of division. He won new laurels at Salamanca (1812) and in the Pyrenees, and received a command at the first restoration of the Bourbons. He joined Napoleon when the king fled the country, and held a divisional command in the Waterloo campaign (*q.v.*). He retired from the army at the second restoration, and in 1819 was elected to the chamber of deputies, where he used his considerable influence on the side of the liberal principles of 1789. At this time he began his history of the Peninsular War. In 1823 he protested against French intervention in Spain, and after the dissolution of 1824 was re-elected for three constituencies. He died in Paris

THE PURPLE FOXGLOVE, A WILD FLOWER COMMON IN ROCKY PLACES THROUGHOUT EUROPE. Small figures show vertical section through flower, and flower with part of corolla removed.

on Nov. 28, 1825, and the great esteem in which he was held for his maintenance of liberal principles was shown by the vast concourse at his funeral.

The *Histoire de la guerre de la Péninsule sous Napoléon* was published from his notes in 1827, and a collection of his speeches (with memoir by Tissot) appeared in 1826. See CUISIN, *Vie militaire, politique, etc., du général Foy*; VIDAL, *Vie militaire et politique du général Foy*.

FRAAS, KARL NIKOLAS (1810–1875), German botanist and agriculturist, was born at Rattelsdorf. He studied at Munich, and in 1835 went as inspector of the court garden at Athens, where in 1836 he became professor of botany. In 1842 he returned to Germany as teacher at the central agricultural school at Schleissheim. In 1847 he was appointed professor of agriculture at Munich, and in 1851 director of the central veterinary college. He died at Munich on Nov. 9, 1875.

His principal works are: *Synopsis florae classicae* (Munich, 1845); *Klima und Pflanzenwelt in der Zeit* (Landsh., 1847); *Histor.-encyklopädi. Grundriss der Landwirthschaftslehre* (Stuttgart, 1848); *Geschichte der Landbau und Forstwissenschaft seit dem 16 Jahrh.* (Munich, 1865). He also founded and edited a weekly agricultural paper, the *Schranne*.

FRACASTORO [FRACASTORIUS], GIROLAMO [HIERONYMUS] (1483–1553), Italian physician and poet, was born at Verona. He studied at Padua and became professor of philosophy there in 1502, afterwards practising as a physician in Verona. It was by his advice that Pope Paul III., on account of the prevalence of a contagious distemper, removed the Council of Trent to Bologna. Fracastoro's theory of infection was that "infection" was due to the passage of minute bodies, capable of self-multiplication, from the infector to the infected, a theory which bears a superficial resemblance to modern doctrine. In 1517, when the builders of the citadel of San Felice (Verona) found fossil mussels in the rocks, Fracastoro took the view—following Leonardo da Vinci—that they were the remains of animals once capable of living in the locality. He died at Cusi, near Verona, on Aug. 8, 1553; and in 1559 the town of Verona erected a statue in his honour.

The principal work of Fracastoro is a kind of medical poem entitled *Symphylidis, sive Morbi Gallici, libri tres* (Verona, 1530), which has been often reprinted and also translated into French and Italian. His complete works were published at Venice in 1555, and his poems were collected and printed at Padua in 1728.

FRACKVILLE, a borough of Schuylkill county, Pa., U.S.A., 8m. N. of Pottsville. It is served by the Pennsylvania and the Reading railways. The population was 5,590 in 1920; 1930 it was 8,034. Anthracite mining is the principal occupation, and there are factories making saws, overalls and shirts.

FRACTION, a part of any unit, as a fraction of a pound, of an acre, of an inch, of an hour, or of a group.

FIRST IDEAS

Elementary Idea of Fraction.—If we take any two positive integers, say 2 and 3, the quotient $\frac{2}{3}$ is a fraction. More generally speaking, if we take any two positive finite integers, a and b , such that b is not zero, the quotient $\frac{a}{b}$ is integral, if and only if, a is exactly divisible by b . If a is not so divisible and is less than b , speaking in the primitive sense $\frac{a}{b}$ is called a *fraction* or, according to relatively late usage, a *proper fraction*. In this expression a and b are called the *terms* of the fraction, a being the *numerator* (numberer) and b the *denominator* (namer). We may also consider this fraction as representing a of the b equal parts of some unit, a being then the "numberer" of the parts and b the "namer" of the parts, as in three-fourths ($\frac{3}{4}$) of a pound. We may also look upon the fraction as representing one b th of a units; for example, $\frac{2}{3}$ may be thought of as representing one-third of two units. These various ideas of a fraction are consistent with one another, as also with the idea that, say, $\frac{3}{4}$ means the ratio of 3 to 4, or the number which, multiplied by 4, becomes 3.

Extension of the Idea of Fraction.—These elementary ideas of fraction have been extended from time to time so as to permit of terms that are fractional, irrational, or imaginary, or that represent still other types of number, the denominator b never being zero.

The tendency to generalize has led to allowing the numerator

to be any multiple of the denominator, the fraction then becoming 1 or some other integer; or to be any number whatsoever, not only less than but equal to or greater than the denominator. Since these two latter generalized cases do not properly represent fractions in the primitive sense ("proper" fractions), they are called *improper fractions*.

The fraction $\frac{a}{b}$ may be expressed as a/b , this being a more convenient form for printing or typewriting. Since the slanting bar resembles the old symbol for *solidus* (later used in the British 2/6 for 2s. 6d.), the form a/b is sometimes called the *solidus form*. If a and b are both rational, a/b is called a rational fraction; if both are integers, it is called a *simple fraction*; if either a or b is fractional, a/b is called a *complex fraction*. Questions relating to the least (in algebra, *lowest*) common denominator are sufficiently discussed in any elementary text book, where it is also shown that any rational complex fraction can be reduced to a simple fraction.

For the study of such continued fractions as

$$a + \frac{b}{c + \frac{d}{e + \frac{f}{g + \frac{h}{i + \frac{j}{k}}}}} \quad \text{or} \quad 2 + \frac{1}{3 + \frac{1}{4}}$$

see CONTINUED FRACTIONS.

Laws of Operations.—In any of these cases the laws governing the fundamental operations with fractions are as follows:

$$\frac{a}{b} + \frac{c}{d} = \frac{ad+bc}{bd}; \text{ for example, } \frac{3}{4} + \frac{2}{3} = \frac{9+8}{12} = \frac{17}{12} = 1\frac{5}{12};$$

$$\frac{a}{b} - \frac{c}{d} = \frac{ad-bc}{bd}; \text{ for example, } \frac{3}{4} - \frac{2}{3} = \frac{9-8}{12} = \frac{1}{12};$$

$$\frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}; \text{ for example, } \frac{2}{3} \times \frac{3}{4} = \frac{2 \times 3}{3 \times 4} = \frac{1}{2};$$

$$\frac{a}{b} \div \frac{c}{d} = \frac{ad}{bc}; \text{ for example, } \frac{2}{3} \div \frac{3}{4} = \frac{2 \times 4}{3 \times 3} = \frac{8}{9};$$

$$\left(\frac{a}{b}\right)^2 = \frac{a^2}{b^2}; \text{ for example, } \left(\frac{2}{3}\right)^2 = \frac{4}{9};$$

$$\sqrt{\frac{a}{b}} = \frac{\sqrt{a}}{\sqrt{b}}; \text{ for example, } \sqrt{\frac{8}{9}} = \frac{\sqrt{8}}{\sqrt{9}} = \frac{1}{3}\sqrt{8}, \text{ or } \frac{2}{3}\sqrt{2}.$$

Reduction.—With respect to the reduction of fractions to higher or lower terms, the following laws are valid for any value of m except zero and infinity:

$$\frac{a}{b} = \frac{ma}{mb} \quad \frac{a}{b} = \frac{a \div m}{b \div m}$$

When all common factors have been removed from both terms of a fraction, the fraction is said to be *reduced to lowest terms*, or to be *irreducible*.

It is often possible to reduce a proper fraction a/b to the sum of two or more simpler fractions. For example, to perform the following reduction to *partial fractions*:

$$\frac{a^3-6a^2+a+2}{a^3-4a-12} = \frac{a^2}{a+2} + \frac{1}{a-6}.$$

The methods of procedure are given in most intermediate or higher algebras, but the importance of the subject is not seen until the student reaches the calculus.

Difficulties Created by Colloquial Expressions.—The colloquial use of a fraction like $\frac{1}{2}$ is so extended as to cause considerable difficulty on the part of a learner. He hears of half of an object, and can easily visualize it; half of a group is a little more difficult; half as large is still more so; and the idea becomes still less distinct when he hears such expressions as "half as long a time," "half as dark," and "half as beautiful." The simplest fraction thus comes, through such colloquial expressions, to be unusually difficult. Certain other fractions—notably $\frac{1}{4}$, $\frac{1}{10}$, and $\frac{1}{100}$ —are used in the same loose way.

Vicissitudes of the Name.—Since "fraction" (from Lat. *frangere*, to break) means "broken," it was natural for the English writers of the 16th century to speak of "fractions or broken num-

bers" and of a "broken of broken" (Baker, 1568), meaning a fraction of a fraction. The word "fragment" was also occasionally used for "fraction." In the middle ages the word *minucia* was used as the equivalent of *fractiones*, and not solely with the meaning of "minutes" as in sexagesimal fractions. The fact that a fraction is a broken number led to such expressions in the early printed books as *Ein gebrochene zal* (Riese, German, 1522), and *Die ghebroken ghetalen* (Raets, Dutch, 1580). Since the Latin *ruptus* also means "broken," such names as *roito* (Italian), *rocto* (Spanish), and *roupt* and *nombre rompu* (French) appear in the early printed books.

Fundamentally One Type.—We speak of proper fractions, mixed numbers, irrational fractions, and the like; but in view of the gradual extension of meaning, it is legitimate to say that any expression a/b is a fraction. It would even be allowable to admit the case of $b=0$, giving an interpretation accordingly, if this were necessary or advisable. Moreover, while we speak of common or vulgar fractions, of decimals, and of sexagesimals, these are chiefly differences in symbolism and have little bearing upon the nature of such a fraction as $\frac{1}{2}$, 0.5 (or 0.5), 30^1 (1^0 being the unit), or 2^{-1} , all of which have the same value.

VULGAR OR COMMON FRACTIONS

Relation to Compound Numbers.—The ancients had such difficulty in representing fractions that they generally resorted to compound numbers in order to avoid their use. Thus the Roman fractions of weight and of value were referred to the *as*. A twelfth part of the *as* was an *uncia*, as was also the twelfth part of a foot, whence our words "ounce" and "inch." Since 16 *asses* (in early times, 10 *asses*) made a *denarius*, the Romans were able to avoid speaking of $\frac{1}{2}$ of a *denarius* by referring to 8 *asses*, just as we may refer to 8 ounces instead of to $\frac{1}{2}$ of a pound, avoirdupois. To represent $\frac{1}{3}$ of a *denarius* the Roman would say *denarii uncia semuncia*; that is, $\frac{1}{3}$ and $\frac{1}{6}$ of $\frac{1}{2}$ of a *denarius*. This use of unit fractions goes back to some of the earliest fraction forms known, appearing in the Rhind (Ahmes) Papyrus of c. 1650 B.C., where the ratio of 2 to 43 is expressed (to use modern symbols) as $\frac{1}{2} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32} + \frac{1}{64}$. The same plan was used by Heron (Heron) of Alexandria (possibly c. 200), in the Akhmim Papyrus (c. 8th century), by Rabbi Sa'adia ben Joseph el-Fayyumi (c. 930), and even, for certain purposes, up to modern times. Such compound numbers as 3yd. 1ft. 6in., instead of $3\frac{1}{2}$ yd., and as £2 10s. instead of £2½, are late evidences of the desire to avoid fractions whenever possible.

Ancient Symbols.—In the Egyptian hieroglyphics the unit fraction was represented by a symbol resembling the outline of an eye, the denominator being represented underneath. In hieratic a dot replaced this symbol, $\frac{1}{3}$ appearing in somewhat such form as $\frac{\cdot}{\text{III}}$. The Greeks had various forms, one being two short lines above a numeral, as in $\frac{\text{II}}{\text{V}}$ for $\frac{2}{5}$, and $\frac{\text{I}}{\text{V}}$ for $\frac{1}{5}$. The most common of all their fractions, the half, had a special symbol resembling our initial parenthesis (, Aristarchus (c. 260 B.C.) wrote the word or its initial for the numerator and the numeral for the denominator, as we might write "ten 71st,"—in Greek, $\Delta\text{O}^{\text{A}}$. The Greeks also used the plan of writing the numeral for each term, but doubling it for the denominator, as if we should write $2'3''3'''$ for $\frac{2}{3}$.

On their coins the Romans commonly represented the half by the symbol S (for *semis*), or the Greek Σ or ζ ; $\frac{1}{3}$ (the triens) was . . . (that is, $\frac{1}{3}$), and $\frac{1}{6}$ (the sextans) was . . . They also used bars instead of dots, as in $\frac{\text{II}}{\text{V}}$ (that is, $\frac{2}{5}$) for $\frac{1}{4}$ (the quadrans).

Modern Symbols.—Our present fractions seem to have had their genesis in India. Brahmagupta (c. 628) and Bhāskara (c. 1150) wrote $\frac{2}{3}$ for $\frac{2}{3}$. The Arabs introduced the bar, but they did not make use of it in all cases. When Abraham ben Ezra (Rabbi ben Ezra, c. 1140) adopted the Moorish forms he generally omitted it; but it is commonly found in manuscripts after his time.

The Name.—The fractions that were commonly used by merchants in the late middle ages were called *fractiones vulgares*, whence the French use of *fractions vulgaires* (Trenchant, 1566) and the English "vulgar or common Fractions" (Digges, 1572).

The English writers finally adopted the adjective "vulgar," and the early American writers did the same; but about the beginning of the 19th century the latter changed to "common fractions." In English the word numerator (numberer) has given place to such terms as *numerus*, "topterm," "top," *superior*, and *denominato*, the *denominator* having such equivalents as "base," *inferior*, and *denominate*.

SEXAGESIMAL FRACTIONS

Nature and Origin.—Fractions written on the scale of 60 (Latin, *sexaginta*) are called *sexagesimal fractions* (from the Latin *sexagesimus*, 60th). Since the Babylonians wrote their numbers on a combined scale of 10 and 60, in which the character for 1 represented any power of 60, they naturally used 60 as a radix in certain systems of measure, as in the case of 60 *maneh* making a talent. The statement that 60 seconds make a minute was probably looked upon quite as our statement that 12 inches make a foot, the idea of sexagesimal fractions, as we have it, not being present. The Greek astronomers no doubt received the scale of 60 from the Babylonians or their successors, and it seems to have been they who developed sexagesimal fractions on a large scale. When they decided to take 120 units as the length of the diameter of their standard circle (probably because its numerous factors, 2, 3, 4, 5, 6, 10, 12, 15, 20, 30, 40 and 60 made the representation of fractions easy), the circle (using the old value 3 for π) became 360 units. To each of these units they gave the name *moîpa* (*moi'ra*), which became (either through the Latin *de+gradus*, step, or the Arabic *daraja*, step, scale, ladder) our "degree." They then called $\frac{1}{60}$ of a degree a first part (*πρωτα εξηκοστη*, *pro'ta hexekostâ*; Latin, *pars minuta prima*, first small part), whence our "minute"; and $\frac{1}{3600}$ a second part (*δευτερα εξηκοστη*, *deu'tera hexekostâ*; Latin, *pars minuta secunda*), whence our "second," and so on. Since these fractions were used in astronomy, they were called "astronomical fractions" in the middle ages. They were also known as "physical fractions," and so we find Gemma Frisius (c. 1540) writing *De Fractionibus Astronomicis, siue de minutis Physicis*, to distinguish them from the *fractiones vulgares*. He wrote:

\tilde{s} .	\tilde{g} .	\tilde{m} .	$\tilde{2}$.	$\tilde{3}$.	$\tilde{4}$.
1.	10.	25.	17.	21.	27.
for 1 sign (30°),	10°,	25',	17'',	21''',	27 ^{iv} .

To the mediaeval astronomers and their successors in the Renaissance such fractions were probably as significant as our decimal fractions are to us, but the operations beyond subtraction were difficult.

DECIMAL FRACTIONS

Forerunners.—The mediaeval computer who wished to find the square root of 7, having no decimal fractions with which to work, first multiplied the number by, say, 10,000, then found the square root of 70,000 to three figures, and then divided the result (246) by 100, obtaining $2\frac{46}{100}$, or $2\frac{23}{50}$. The process was known to the Hindus and the Arabs and is found in Europe as early as the 12th century. Even after the decimal fraction was known, such devices remained; this is seen, for example, in the custom of comparatively recent writers in taking the radius of a circle as 10,000,000 so as to avoid the use of decimals in the trigonometric functions. Early in the 15th century al-Kashî, assistant of the prince astronomer, Ulugh Beg of Samarkand, is said to have given the value of π as $\frac{\text{sah-hah}}{3}$ 141592653589732, where *sah-hah* (modern Turkish *sahih*) means complete or integral. If the manuscript of his work now in Constantinople goes back to his time, this is the earliest evidence we have of any precise knowledge of the decimal fraction. Pellos (1492) made use of the decimal point in cases like $9537919 \div 70$. He first placed a decimal point, $953791\cdot9$, then divided by 7, obtaining 136255 with a remainder, and finally wrote the result as $136255\frac{2}{7}$. In Rudolff's *Exempel-Büchlin* of 1530 an example in compound interest is solved by the aid of decimal fractions written in the form $393|75$, $413|4375$, and so on to $20|61640996972656250000$, the operations being carried on as they are to-day. The first book devoted solely to these frac-

tions was *De Thiende* (Flemish; there was a French translation, *la Disme*, The Tenth, in the same year), written by Simon Stevin (Stevinus) and published in 1585. In this the decimal $27\cdot847$ (English) or $27\cdot847$ (American) appears as $27\text{ }08\text{ }14\text{ }37\text{ }1$. The first writer to use a decimal point with full understanding of its significance seems to have been Clavius. In the columns of differences of his table of sines printed in his work on the astrolabe in 1585, differences like 46·5 are given, this particular one being explained in the chapter "De parte proportionali sinuum, & arcuum" (p. 229) as equivalent to $46\frac{5}{10}$. The question as to what kind of decimal point to use has never been settled. The use of a separatrix of some kind was generally agreed upon early in the 17th century, but the precise form or position is still uncertain. The decimal (or centesimal) symbol % appears in the 15th century under the form "per c°," the "per" being finally dropped and the c° becoming $\frac{\circ}{100}$ in the 17th century. It is of Italian origin.

Operations.—The operations with decimal fractions are the same as with integers except for the proper placing of the decimal point, a matter of no difficulty as the subject is now taught. The rules are easily deduced by first writing each fraction as a common fraction. For example, $\frac{3}{10} \times \frac{7}{100} = \frac{21}{1000}$, and hence $0\cdot3 \times 0\cdot07 = 0\cdot021$ (British), or $0\cdot3 \times 0\cdot07 = 0\cdot021$ (American).

Recurring Decimals.—If we reduce $\frac{1}{6}$ to a decimal fraction, we have (using the British decimal point in this discussion) $0\cdot1666$, the 6 continually recurring. Such a fraction is called a *recurring decimal*, *circulating decimal*, or *repeating decimal*. This fraction may be written $0\cdot1\dot{6}$, the superposed dot indicating that the 6 is repeated indefinitely. We see, by division, that

$$\frac{1}{6} = 0\cdot144144\ldots = 0\cdot1\dot{4},$$

$$\text{and } \frac{1}{58} = 3\cdot2363636\ldots = 3\cdot2\dot{3}\dot{6},$$

the dots being placed above the first and last figures of the *repetend*.

Considering the last of these cases, $3\cdot2\dot{3}\dot{6}$, the decimal $0\cdot03\dot{6}$ forms an infinitely decreasing geometric series, $0\cdot036 + 0\cdot00036 + \ldots$, in which the first term is $0\cdot036$, the ratio is $\frac{1}{100}$ and the number of terms is infinite. The formula for S, the limit of the sum of this series, is $a/(1-r)$. Substituting

$$S = 0\cdot036/(1-0\cdot01) = 0\cdot036 \div 0\cdot99 = \frac{2}{55},$$

$$\text{and so } 3\cdot2\dot{3}\dot{6} = 3\cdot2 + \frac{2}{55} = 3\cdot2\frac{2}{55} = 3\cdot2\frac{1}{27\cdot5}.$$

The following rule for the reduction to a common fraction is easily deduced: From the given number ($3\cdot236$), considered as a whole number (3236), subtract the non-recurring part (32) and divide the result (3204) by a number composed of as many 9's as there are figures in the repetend with as many zeros annexed as there are figures between the repetend and the decimal point (that is, by 990). The result is the equivalent common fraction ($3204 \div 990 = 3\frac{178}{275}$).

There is a considerable amount of theory connected with the recurring decimal, and the subject formerly found place in most of the elementary arithmetics.

THE INDEX NOTATION

Origin.—The need which modern science has created for decimal fractions to a large number of decimal places has led to the introduction of a new symbolism based upon the fact that $\frac{1}{10^n} = 10^{-n}$, and hence that $\frac{1}{1000000} = 10^{-6}$,—a shorter way of expressing the common fraction. For example, instead of saying that a millimicron is 0·00000001 of a meter, we may say that it is 10^{-7} m.; and instead of saying that a square millimeter is 0·00155 of 1 sq. in., we may say that it is $1\cdot55 \times 10^{-3}$ sq. in. or 155×10^{-5} sq. in. The index notation is also used in connection with very large numbers, as when we express 750,000,000,000,000 ultra violet waves per second as $7\cdot5 \times 10^{14}$ per second.

Advantages of the Index Notation.—The demands of astronomy and physics render it necessary to use numbers to represent such great and such small distances and lengths that the eye has difficulty in detecting their meaning when they are written. The index notation not only condenses the statement but it is particularly valuable when logarithms are to be used.

For example, in the case of 1.55×10^{-3} we see that the characteristic of the logarithm is -3, and in the case of 7.5×10^{14} it is 14. Since a fraction expressed in any one notation can be expressed in any other, it is immaterial what notation is used so far as the general principles of fractions are concerned.

BIBLIOGRAPHY.—On the general theory of fractions consult E. Combe, *Cours d'Arithmétique* (12th ed., 1904); A. Höfler, *Didaktik des mathematischen Unterrichts* (Leipzig, 1910). (Foundation principles.) On the history of the subject consult J. Tropke, *Geschichte der Elementar-Mathematik*. 2nd ed., 1921, Berlin (de Gruyter), vol. i., p. 118-49; D. E. Smith, *History of Mathematics* (Boston, 1925), vol. ii., pp. 208-27, 418-20, 477-93. (General development of the various types of fraction, with facsimiles from early works.) (D. E. S.)

FRACTIONAL DISTILLATION: see DISTILLATION.

FRACTIONATION, in chemistry, consists in separating into fractions materials which differ in rates of crystallization, boiling points or other characteristics, rendering possible a sharp separation. Gases may be separated by fractional combustion, as in burning oxygen out of the air to secure the nitrogen (see NITROGEN, FIXATION OF). Fractional crystallization requires conditions favourable for the crystallization of one component in a reasonably pure state. Further purification is obtained by redissolving and re-crystallization. Various conditions, temperature and a choice of solvents are important, as well as a knowledge of the characteristics of the solids to be separated. Fractional distillation is dependent upon differences in boiling points, the best example being the concentration of alcohol (see ALCOHOL IN INDUSTRY). Here the lower boiling point of the alcohol allows its removal in a high state of purity from the water with which it is admixed. Fractionating columns are of various designs, the object in all cases being to concentrate to a high purity with low heat consumption. Complex mixtures of liquids are often separated by several distillations, in the course of which one after another is removed, according to predetermined conditions. Fractionation may also be applied to precipitation, where one material after another may be thrown out of a mixed solution, depending upon the reagents used.

FRACTURES. A fracture is a break, more especially of a bone or cartilage. The bone may be broken at the part where it is struck (fracture from direct violence), or may break in consequence of a strain applied to two levels of the bone at some distance apart (fracture from indirect violence). The actual form of the fracture of a long bone is classified in accordance with whether it is transverse, oblique, comminuted or impacted. The first two terms explain themselves. A comminuted fracture is one in which there is fragmentation of the bone at the site of injury; an impacted fracture is one in which the broken ends are driven together by the causative violence in such a way as to become locked. A type known as the greenstick variety is met with in children; the fracture does not extend right across the bone, and angulation is therefore the only possible displacement.

Compound Fractures.—Fractures of all types are subdivided into those which are simple (or closed), or compound (or open). The term simple means that the skin over the fracture remains intact. A compound fracture is one in which the skin is broken, either by protrusion of the bones through the skin after the break has occurred, or by the direct action of the violence which caused it; this latter condition is seen as a result of missile injuries and run-over accidents. A compound fracture is always a serious condition on account of the possibility of infection of the wound by micro-organisms. If germs are introduced into the wound suppuration will occur, and when this process invades the broken surfaces of bone it is a dangerous complication; in its most severe forms it may necessitate amputation in order to stop blood poisoning which may threaten the patient's life. In any case infection will delay union, and very likely lead to the death of fragments of bone in the neighbourhood of the fracture.

The experience of the Great War was largely in relation to fractures of this nature, and a very definite advance was made in the treatment of these cases. It was found that no chemical antiseptic was effective in disinfecting a lacerated wound; the only effective procedure is the clean excision of the wound track, involving the removal of all contaminated tissues. The application

of this process of wound excision or *débridement* in severe compound fractures has greatly improved the results and minimized the number of cases of serious infection. To have a proper hope of success the procedure should be carried out within twelve hours of infliction of the injury. So long as infection does not occur, or once it has been eradicated, the treatment of a compound fracture is on the same lines as a simple one.

Diagnosis.—The diagnosis of a fracture can usually be made on the history of an injury followed by acute pain in a bone and the loss of function of the limb affected. In many cases there is gross deformity which can be recognized by comparing the injured limb with the sound side and can be confirmed by measurements taken between known bony points. A sensation of grating (crepitus) between the broken bone ends is characteristic in cases which are not impacted. Nowadays, however, radiological examination is essential if a full appreciation of the position of the fragments is to be obtained, and few fractures can be treated up to the highest current standard without the aid of this procedure. Radiology is also of great value in observing the progress of the case towards repair.

Union.—Bones unite by a process of repair comparable to that observed in any other tissue of the body. After the primary effusion of blood and serum which follows the injury the swelling so formed is gradually absorbed and replaced by granulation tissue. The granulation tissue laid down about broken bone differs from that in the soft parts in that it becomes calcified, and finally is converted into true bone. The term callus is applied to this type of repair tissue. Finally, if the bones are in good alignment the normal structure is completely restored. The speed of union varies with individual fractures and with individual patients in a way and to a degree which cannot be explained on any simple grounds. In general the process is more rapid in children. In the adult the age of the patient does not have a very great influence on the process.

Treatment of a fracture in which there is any serious displacement will in the first place involve setting the bones, that is to say, putting the fragments in as nearly normal a position as circumstances permit. This is effected or attempted by manipulation under an anaesthetic. In many cases, however, of fractures of long bones in which there is overlap, satisfactory reposition cannot be obtained by this means, and the adjustment of the ends is effected by gradual weight extension or traction which stretches the muscles and tends to draw the bones into their normal alignment.

Open Operations.—Should it be impossible to get satisfactory apposition of the fragments by one of these methods, open operation is justifiable and may be the only method of obtaining a first-class result. The aim of surgical technique in relation to bone work for which Lane was mainly responsible, has rendered these operations a safe and straightforward proposition. When the fracture has been exposed and adjusted, some method of internal fixation is often employed, the bones being joined together by metal or bone plates, or sutured by wire. There is a tendency at the present day to avoid the use of metal in these open operations and to employ instead slats of bone which may be obtained from the patient or from some other source.

Fixation.—The next step in treatment after reduction of deformity is the maintenance of position of the reduced fragments. This can be effected by various forms of external splintage. Plaster of Paris is the most effective method of fitting a firm splint to a limb, but it can only be applied to a limited group of cases. Wire skeleton splints which are completed by fabric slings are popular for the lower extremity. Aluminium gutter splints are of value in some cases on account of their malleability and translucence to X-rays. The period during which splints are kept applied varies widely in accordance with the nature of each fracture. In general they are not removed till union is so far advanced that their absence does not cause a risk of displacement.

Restoration of Function.—In every fracture the neighbouring muscles, tendons, and very often joints, are damaged in some degree. The disabilities which may follow a fracture are most often the result of these latter injuries, and after-treatment is

directed to the restoration of full function and movement of muscles and joints. Massage can be employed from an early stage, though it may be impossible in circumstances in which rigid fixation of the bones has to be maintained. It is of value in promoting absorption of swelling, and thereby promotes repair. Passive and active movement of joints near the fracture is carried out as soon as the stability of the broken bone will permit. Electrical methods of various kinds are employed to exercise and repair muscles, and have considerable value in properly selected cases. In general it may be said that in fractures of the upper extremity the main aim should be to restore full and early movement of joints and muscles, even at the expense of imperfect reposition of the broken bone. In the lower extremity perfect alignment of the bones is the first necessity if secondary joint troubles are to be avoided.

Delayed or Un-united Fractures.—Delay in the process of union is common enough for several reasons, the commonest being probably the interposition of soft structures between the broken ends. The presence of syphilis in the system and certain wasting diseases are also deterrent factors. Failure of bones to unite firmly in healthy individuals is rare. It is, however, met with in those cases in which a large part of the bone substance has been destroyed or damaged by the primary injury or subsequent infection. These cases are now treated in suitable subjects with a high measure of success by bone grafting. Fresh bone taken from the patient himself gives the most reliable results. In cases in which the original broken bone ends can actually be brought together, a beef bone and preserved human bone have been employed with some measure of success. As to the degree to which the grafted bone replaces normal bone, the consensus of opinion is that the graft acts as a scaffold along which new bone grows, rather than that it becomes a part of the host skeleton. At any rate it forms a firm bond about which, under suitable conditions, new bone formation takes place.

(C. M. P.)

FRAGONARD, JEAN-HONORÉ (1732–1806), French painter, was born at Grasse, the son of a glover. He was articled to a Paris notary when his father's circumstances became straitened through unsuccessful speculations, but he showed such talent and inclination for art that he was taken at the age of 18 to Boucher, who, recognizing the youth's rare gifts, sent him to Chardin's atelier. Fragonard studied for six months under the great luminist, and then returned to Boucher, whose style he soon acquired so completely that the master entrusted him with the execution of replicas of his paintings. Though he was not a pupil of the Academy, Fragonard gained the Prix de Rome in 1752 with a painting of "Jeroboam sacrificing to the Idols," but before proceeding to Rome he continued to study for three years under Van Loo. In the year preceding his departure he painted the "Christ washing the Feet of the Apostles" now at Grasse cathedral. In 1755 he took up his abode at the French Academy in Rome, then presided over by Natoire. There he benefited from the study of the old masters such as Pietro da Cortona whom he was set to copy—and a summer sojourn at the Villa d'Este in the company of the abbé de Saint-Non, who engraved many of Fragonard's studies of these entrancing gardens—did more towards forming his personal style than all the training at the various schools. Added to this influence was the deep impression made upon his mind by Tiepolo's works which he had an opportunity of studying in Venice before he returned to Paris in 1761. In 1765 his "Corésus et Callirhoé" (Louvre) secured his admission to the Academy. It was made the subject of a pompous eulogy by Diderot, and was bought by the king, who had it reproduced at the Gobelins factory. Hitherto Fragonard had hesitated between religious, classic and other subjects; but now the demand of the wealthy

AN ENGLISH FRAME OF THE QUEEN ANNE PERIOD (1690–1740)

art patrons of Louis XV.'s pleasure-loving court turned him definitely towards those scenes of love and voluptuousness with which his name will ever be associated, and which are made acceptable by the tender beauty of his colour and the virtuosity of his facile brushwork—such works as the "Serment d'amour," "Le Verrou," "La Culbute," "La Chemise enlevée" and "The Swing" (Wallace collection), and his decorations for the apartments of Mme. du Barry and the dancer Marie Guimard.

The Revolution put an end to the *ancien régime*, and Fragonard, who was so closely allied to its representatives, left Paris in 1793 and found shelter in the house of his friend Maubert at Grasse, which he decorated with the series of decorative panels known as the "Roman d'amour de la jeunesse," originally painted for Mme. du Barry's pavilion at Louvecienne. The panels were in the possession of Mr. Pierpont Morgan, and have passed into the Frick Collection in New York. Fragonard returned to Paris early in the 19th century, and died there in 1806, neglected and almost forgotten. But within the last 30 years he has regained the position among the masters of painting to which he is entitled by his genius.

Besides the works already mentioned, there are four important pictures by Fragonard in the Wallace collection. The Louvre contains 13 examples of his art. Other works are in the museums of Lille, Besançon, Rouen, Tours, Nantes, Avignon, Amiens, Grenoble, Nancy, Orleans, Marseilles, etc., as well as at Chantilly. Some of Fragonard's finest work is in the collections of the Rothschild family in London and Paris. His most important engraving is "L'Armoire" (1778).

See E. and J. de Goncourt, *L'Art du dix-huitième siècle* (1883); F. Naquet, *Fragonard* (1890); R. Portalis, *Fragonard* (1899), fully illustrated; V. Jozs, *Fragonard—moeurs du XVIII^e siècle* (1901); C. Maclair, *Fragonard* (1904); P. de Nolhac, *J. H. Fragonard* (1906); L. de Fourcaud, *Fragonard* (1906); Dayot et Vaillet, *L'oeuvre de Chardin et de Fragonard* (1907).

FRÄHN, CHRISTIAN MARTIN (1782–1851), German numismatist, was born at Rostock on July 4, 1782, and settled in Russia as professor of oriental languages at Kazan. He then became director of the Asiatic museum in St. Petersburg, where he died on Aug. 28, 1851. Frähn was a standard authority on Asiatic coins.

Frähn wrote over 150 works. Among the more important are: *Numophylacium orientale Pototianum* (1813); *De numorum Bulgaricorum fonte antiquissimo* (1816); *Numi cufici ex variis museis selecti* (1823); *Notice d'une certaine d'ouvrages arabes, etc., qui manquent en grande partie aux bibliothèques de l'Europe* (1834), and *Nova supplementa ad recensionem Num. Muham. Acad. Imp. Sci. Petropolitane* (1855).

FRAME, a word employed in many different senses, signifying something joined together or shaped. In constructional work it connotes the union of pieces of wood, metal or other material for purposes of enclosure as in the case of a picture or mirror frame. Frames intended for these uses are of great artistic interest but comparatively modern origin. There is no record of their existence earlier than the 16th century, but the decorative opportunities which they afforded caused speedy popularity, and the Renaissance found in the picture frame a rich and attractive means of expression. Fine work was produced in such profusion that great numbers of examples are still extant. Frames for pictures or mirrors are usually square, oblong, round or oval, and, although they have usually been made of wood or composition overlaid upon wood, the richest and most costly materials have often been used. Ebony, ivory and tortoise-shell; crystal, amber and mother-

AN 18TH CENTURY MIRROR FRAME IN THE ELABORATE STYLE OF THE LOUIS XVI PERIOD

of-pearl; lacquer, gold and silver, and almost every other metal have been employed for this purpose. The domestic frame has in fact varied from the simplest and cheapest form of a plain wooden moulding to the most richly carved examples. The introduction in the 17th century of larger sheets of glass gave the art of frame-making a great impetus, and in the 18th century the increased demand for frames, caused chiefly by the introduction of cheaper forms of mirrors, led to the invention of a composition which could be readily moulded into stereotyped patterns and gilded. This was eventually the deathblow of the artistic frame, and since the use of composition moulding became normal, no important school of wood-carving turned its attention to frames until the revival of interest in the applied arts in the first quarter of the present century.

FRAMINGHAM, a town of Middlesex county, Massachusetts, 21 m. W. by S. of Boston; served by the Boston and Albany and the New York, New Haven and Hartford railways. The population was 17,033 in 1920, and 22,210 in 1930 by the Federal census. The town occupies 27 sq.m. of level ground, dotted with lakes and ponds, includes three villages, and has the largest unlimited town meeting in the country. It is the seat of the State arsenal and of a State normal school (the oldest in the country), opened in Lexington in 1839 and moved to Framingham in 1852. In South Framingham is the State reformatory for women. The manufactures are numerous and varied, including straw hats, boots and shoes, rubber goods, patent medicines, boilers, shipping tags, stoves, heating apparatus, automobiles and paper specialties. The aggregate output in 1925 was valued at \$25,432,793, and was estimated at \$32,000,000 for 1928. Framingham was settled about 1640 and incorporated in 1700. It was named after the English home (Framlingham) of Governor Danforth, who at one time owned the land. The old Boston-to-Worcester turnpike ran through the village of Framingham Center, and in 1834 the Boston and Worcester railway was laid through South Framingham, which then became the most important village of the town.

FRAMLINGHAM, a market town in the Eye parliamentary division of East Suffolk, 91 m. N.E. from London on a branch of the L.N.E.R. from Wickham market. Pop. of civil parish (1921) 2,397. The church of St. Michael is a fine Perpendicular and Decorated building of black flint, surmounted by a tower 96 ft. high. In the interior there are a number of interesting monuments, including those of Thomas Howard, 3rd duke of Norfolk (d. 1554), and of Henry Howard, the famous earl of Surrey, who was beheaded by Henry VIII. The castle forms a picturesque ruin, consisting of the outer walls 44 ft. high and 8 ft. thick, with 13 towers about 58 ft. high, a gateway and some outworks. Framlingham college for boys was founded in 1864 as a memorial to Albert, the prince consort. Framlingham (Frendlingham, Framalingham) in early Saxon times was probably the site of a fortified earthwork to which St. Edmund the Martyr is said to have fled from the Danes in 870. The Danes captured the stronghold after the escape of the king, but it was won back in 921, and remained in the hands of the crown, passing to William I. at the Conquest. Henry I. in 1100 granted it to Roger Bigod, who in all probability raised the first masonry castle. Hugh, son of Roger, created earl of Norfolk in 1141, succeeded his father, and the manor and castle remained in the Bigod family until 1306, when in default of heirs it reverted to the crown, and was granted by Edward II. to his half-brother Thomas de Brotherton, created earl of Norfolk in 1312. On an account roll of the castle of 1324 there is an entry of "rent received from the borough," and of a fair and market, and in all probability burghal rights had existed at a much earlier date. Town and castle followed the vicissitudes of the dukedom of Norfolk, passing to the crown in 1405, and being alternately restored and forfeited by Henry V., Richard III., Henry VII., Edward VI., Mary, Elizabeth and James I., and finally sold in 1635 to Sir Robert Hitcham, who left it in 1636 to the master and fellows of Pembroke hall, Cambridge.

FRAMPTON, SIR GEORGE (1860-1928), English sculptor and craftsman, was born in 1860, and died in London on May 21, 1928. He studied under W. S. Frith at Lambeth, in the Academy schools, and in Paris under Mercié. He became A.R.A.

in 1894. R.A. in 1902, and was knighted in 1908. Frampton held many English and foreign academic honours, and was one of the foremost figures in the English art world. He first exhibited in 1884, but no really characteristic work by him was shown until 1893, when his first experiment in colour in sculpture was shown, the "Madonna and Child." From that time onward he experimented with decorative sculpture, using many kinds of material, seeking to associate sculpture with the arts and crafts. He was at one time "Master" of the Art Workers' guild. He was anti-classical in spirit, and wished to substitute natural forms for architectural devices. He executed public monuments in London, Glasgow, Leeds, Calcutta and Winnipeg. The most famous are the bronze "Steamship" and "Sailing Ship" on the "Lloyd's Register" building, "Peter Pan," known to all child visitors to Kensington Gardens, London, and the much discussed Edith Cavell memorial at the foot of St. Martin's lane, London.

FRANC. A French coin current at different periods and of varying values. The first coin so called was one struck in gold by John II. of France in 1360. On it was the legend *Johannes Dei gracia Francorum rex*; hence, it is said, the name. It also bore an effigy of King John on horseback, from which it was called a *franc à cheval*, to distinguish it from another coin of the same value, issued by Charles V. on which the king was represented standing upright upon a Gothic dais; this coin was termed a *franc à pied*. As a coin it disappeared after the reign of Charles VI., but the name continued to be used as an equivalent for the *livre tournois*, which was worth 20 sols. French writers would speak without distinction of so many livres or so many francs, so long as the sum mentioned was an even sum; otherwise livre was the correct term, thus "*trois francs*" but "*trois livres cinq sols*." In 1795 the livre was legally converted into the franc, at the rate of 81 livres to 80 francs, the silver franc being made to weigh exactly five grammes.

The franc is now the unit of the monetary system and also the money of account in France, as well as in Switzerland. In Italy, until the end of 1927, the lira was nominally equivalent to the franc, and in Greece the drachma is still nominally equivalent. The franc is divided into 100 centimes, and the drachma into 100 lepta. Other currencies which are nominally equivalent to the franc are the peseta (Spain), the leu (Rumania), the lat (Latvia), the dinar (Yugoslavia), and the leva (Bulgaria). Until comparatively recently, Belgium used the franc, and even during the post-war depreciation, the two currencies for long fluctuated upon parallel lines. In 1926, the Belgian currency was revalued at the rate of frs.175 to the pound sterling, but for the sake of simplicity a new unit, the belga, was introduced for purposes of international exchange. Thirty-five belgas equal one pound at parity, so that one belga is the equivalent of five francs. For everyday purposes, the franc is still used internally, but is not equivalent to the French and Swiss franc.

At the outbreak of war in 1914, the franc was at its par value of 25.22 to the pound. In common with other Allied currencies, it was "pegged" at parity during the war, but after the Armistice was left to find its natural level. The inflation boom of 1919-20, the strain put upon the French finances by the war and the reconstruction of the devastated areas, and the failure and inability of Germany to pay reparations, all in turn contributed to its steady depreciation, only broken from time to time by periods of hectic recovery. Such occurred in 1924, when the Government of the day obtained foreign credits and, by selling dollars and sterling on the Paris Bourse, rapidly drove the exchange from frs.120 to frs.67 to the pound. Subsequently another collapse occurred, caused by the chronic deficit in the French budget, accentuated in April 1925 by the news that the note-issue had surreptitiously exceeded its legal limit.

In the middle of 1926, the franc was at last taken in hand. The national finances had been eased since 1926 by the success of the Dawes scheme as a begetter of reparations, and a stable government attained power. Acting on the advice of their Currency Commission, they cleared the ground by the end of 1926 for *de facto* stabilization at just over frs.120 to the pound. This rate was maintained during 1927 with such marked success, that, though the

Government were prepared to sell foreign exchange to prevent a depreciation of the franc. In practice they had to buy far more than their needs in order to stop an appreciation, to the detriment of French trade. It was to reduce this plethora of foreign exchange holdings that the French authorities bought gold in 1927, thereby upsetting the world's money markets. See also CURRENCY.

FRANÇAIS, ANTOINE, COUNT (1756-1836), better known as FRANÇAIS OF NANTES, French politician and author, was born at Beaupaire, Isère, on Jan. 17, 1756. He became a member of the legislative assembly (1791), a member of the council of Five Hundred (1798) and one of its secretaries, a member of the council of state, and director-general of the indirect taxes (*droits réunis*) (1804). On the second restoration he retired into private life; but from 1819 to 1822 he was representative of the department of Isère, and after the July revolution he was made a peer of France. He died in Paris on March 7, 1836.

Français wrote a number of works, *Le Manuscrit de feu M. Jérôme* (1825), etc.

FRANÇAIS, FRANÇOIS LOUIS (1814-1897), French painter, was born at Plombières (Vosges). After a few years of hard struggle, during which he made a precarious living by drawing on stone and designing woodcut vignettes for book illustration, he studied painting under Gigoux, and subsequently under Corot, whose influence remained decisive upon Français's style of landscape painting. He exhibited first at the Salon in 1837 and was elected to the Académie des Beaux-Arts in 1890. Comparatively few of his pictures are to be found in public galleries, but his painting of "An Italian Sunset" is at the Luxembourg museum in Paris.

FRANCAVILLA FONTANA, a town and Episcopal see of Apulia, Italy, province of Lecce, 22 m. by rail E. by N. of Taranto, 460 ft. above sea-level. Pop. (1921) 17,747 (town); 19,612 (commune). It is in a fine situation, and has a massive square castle of the Imperiali family, to whom, with Oria, it was sold by S. Carlo Borromeo in the 16th century for 40,000 ounces of gold, which he distributed in one day to the poor.

FRANCE, ANATOLE (1844-1924), whose real name was Jacques Anatole Thibault, French man of letters, was born in Paris on April 16, 1844. For 30 years French literature was dominated in the eyes of all the world by the fame of Anatole France. It is true that his influence declined in the last period of his life and that his ideas were questioned, but not his style nor the services rendered by him to the language. In his old age he was revered as a genius and a patriarch. No reputation since Voltaire's has been found comparable with his.

The son of a bookseller called Thibault, this youth who was to make illustrious the pseudonym of Anatole France started his career quite humbly. He was fond of literature, he was studious and erudite, but negligently preferred reading to writing. He composed publishers' puffs and contributed a weekly article signed "Gérôme" to the *Univers Illustré*. For his own amusement he wrote verse, *Les poèmes dorés* (1875) and *Les noces corinthiennes* (1876), which showed learning, charm and taste. In 1879 he published his first volume of stories, *Jocaste et le chat maigre*, and in 1881 his first novel, *Le crime de Sylvestre Bonnard*, which was acclaimed by the discriminating as delightful.

In 1883 he first met Madame Arman de Caillavet, with results that profoundly influenced his career. Mme. de Caillavet became his life-long friend. She was clever and active; she had a host of acquaintances and her receptions were attended by the leading figures of literature and politics. She laboured for the fame of Anatole France, and she forced him out of his inertia into composition. The extracts from her correspondence with him prove the important share she took in his writings, and in the dedication of *Crainquebille* (1904) Anatole France could say: "To Madame de Caillavet, this book which I should not have written without her help, for without her help I should write no books."

For 40 years Anatole France poured out a series of lively, solid, graceful and profound works. There are the pungent and mis-

chievous short stories, *Balthazar* (1889), *L'étui de nacre* (1892), *Le puits de Sainte-Claire* (1895); the meditative and critical books, *Les opinions de Jérôme Coignard* (1893), *La vie littéraire* (4 vol. 1883-92); a philosophical novel, *La rôtisserie de la Reine Pédauque* (1893); an historico-philosophic novel, *Thaïs* (1890), describing Alexandria at the beginning of our era and contrasting the ideals of dying paganism with those of nascent Christianity; an admirable novel on the French Revolution and the Terror, *Les dieux ont soif* (1912); a society novel, *Le lys rouge* (1894), a powerful study of jealousy set amid the artistic treasures and lovely vistas of Florence; then the series of political satires, the four volumes of *L'histoire contemporaine—L'orme du mail* (1897), *Le mannequin d'osier* (1897), *L'anneau d'améthyste* (1899), *M. Bergeret à Paris* (1901), where Anatole France creates the legendary figure of M. Bergeret and portrays society before and during the Dreyfus affair; novels of a revolutionary tendency, *Sur la pierre blanche* (1903), *L'île des Pingouins* (1908), *La révolte des anges* (1914), a biography of Joan of Arc (1909-10); lastly the reminiscences, *Le petit Pierre* (1918), *La vie en fleur* (1922). Such is the sum of this work admirable in its wealth and variety.

The philosophy of Anatole France developed during the course of his career. Until 1900 he was primarily a sceptic. As Voltaire's spiritual son, he delighted in the play of ideas and observed without pity the stupidity and the silliness of men. He probed the past and the present and spared no example of human inconsistency, error or weakness. *Les opinions de Jérôme Coignard* gives the reader much pleasure, so witty and mischievous is the author, and gives him, too, a complete lesson in scepticism. The same remark may be passed on *Les dieux ont soif*, where Anatole France considers almost exclusively the failures of the French Revolution. At this time the author seems to have kept respect for beauty alone, the beauty of natural or artistic forms or of such superior intelligence as was shown in the great Greek and Latin writers. Meanwhile he beamed indulgently upon an imperfect universe. As he believed in nothing, he did not believe in a better or a worse. In the writings prior to 1900 may even be found conservative and aristocratic maxims. A supreme indifference inclined him to accept what is rather than risk what might be.

On the outbreak of the political crisis of 1900, his temper changed. He was then seen to show a preference for the progressive parties, and little by little went on to the revolutionary parties, which became honoured by his support. He was no orator; words came slowly, and neither his mind nor his phrases were of the kind likely to be popular. The part taken by him at public meetings was undistinguished, being limited to signing manifestos and applauding resolutions, especially those with an international objective. He was more powerful with his pen. An opponent of Church and State, he seemed to put his faith in the people and to expect the world to be renewed by some kind of revolution. On this point his ideas remained rather vague. In one of his books, *Sur la pierre blanche*, he ends the description of future society with a dreadful cataclysm that destroys everything, and here he is nearer to nihilism than to socialism. The World War changed the trend of his thoughts. As he was too old to serve in the field he wanted at least to show his good will and asked to be employed in a Tours office. This great upheaval left him uncertain concerning the destinies of humanity. Perhaps extreme scepticism is not for long tolerable, and Anatole France felt the need of escape into a revolutionary faith which he refused to define, leaving it a mere aspiration.

What is indisputable is the quality of Anatole France's art. The younger generations, tried by war, and witnessing the consequent political difficulties, ill comprehend the detachment of dilettante M. Bergeret. They need more moral discipline, they believe more in virtue and action. But they do not deny the master who charmed their elders with his graceful wit and magic phrases. As a storyteller, in lucidity of thought and form, Anatole France is incomparable. In his style, too, there is a sweetness, an almost voluptuous grace, which distinguishes his phrases from those of any other writer. He owed much to Voltaire, much

to Renan, much to the old French romances, to memoirs and to chronicles. He had read and remembered much; but what he borrowed he made his own; all was changed, and for the better, by his style and interpretation. He translated into a pungent idiom all that could delight or stimulate the intelligence of his cultured contemporaries. He was a deep admirer of classicism, and to the end of his life, when he mentioned Molière, Racine or Stendhal his conversation or his writing attained their richest substance and most pleasant harmonies.

He makes another strong claim on the attention of posterity. He was the finest flower of the Latin genius. His knowledge of antiquity was great, and his work contained the essentials of Greek and Latin wisdom. He portrayed in *Thaïs* characters who distil the philosophy of the ancients. He put into the mouth of Jérôme Coignard maxims which likewise represent the sum of the meditations and arguments common to antiquity.

Lastly, in all periods of his career, whatever his theories, he was a deep student of human nature. He expressed in magic words most of the wisdom that may be acquired from the observation of life and the reading of history. He created characters who persist in the memory—Jérôme Coignard, Jacques Tournebroke, M. Bergeret, Madame Martin Bellème, Catherine, the lace worker, Paphnuce, Nicias, Evariste Gamelin. He described what was comic and evil in mortals. He described, too, what was august in man, sacred in man's labours and sufferings. Though he lacked enthusiasm and ardour, his critical intelligence did not prevent him from brooding over human misery, and in the story of Crainquebille he showed his heart. While humbling himself before the invincible forces of fate and lust, he dedicated his work now to irony—which brought brightness into his life—and now to pity—which at other times reminded him that life deserves a serious, a solemn attention. And so he became twice fortunate, for he was at once a subtle artist acclaimed by the critics and a universally respected publicist who influenced the simple-minded. He died at Tours, Oct. 13, 1924.

FRANCE, a country of western Europe, situated between 51° 9' and 42° 23' N. and 4° 42' W. and 8° E. Its boundaries on the north-west (the English channel) and west (Bay of Biscay) are the sea, on the south its frontier is a line based upon the main ridge of the Pyrenees, on the south-east it borders the Mediterranean. The southern part of the eastern frontier is based upon the crest lines of the Maritime, Cottian and Graian Alps, passing east of Mt. Blanc along the eastern scarp of the Chablais to the south shore of the lake of Geneva. Leaving to Switzerland Geneva and its district and a strip along the north-western shore of the lake, the frontier goes along the Jura ridge to the Doubs river soon after reaching which it alters its character. The part described thus far is either sea or watershed, allowance being made for a few compromises as regards watershed lines when large valleys have been cut back through the watershed. The remainder of the frontier lacks this definite physical character and is a result of many historical processes so complex that the relation to physical geography is often obscured. After leaving the Doubs it bends west bringing Switzerland at Porrentruy to the north-western foot of the Jura, bending back again it goes to the vicinity of Basle and then along the Rhine (since the retrocession of Alsace-Lorraine after 1918) to a point east of Lauterburg. In this section the Rhine, flowing along the broad valley bottom, has long formed a marked boundary between the com-

munities on either side.

Leaving the Rhine the frontier runs west-north-west to the north side of the Strait of Dover. In its course it leaves most of the Saar valley outside, runs along the French side of the Ardennes, bends northward down the Meuse to give France the fortress of Givet, and then cuts across the slopes of Hainault and the Flemish plain to the sea a few miles north-east of Dunkirk; in this last section it runs parallel to and some 20–30 m. north of the hills of Artois. France forms a remarkably compact block rather over 600 m. from the coast north of Dunkirk to the most distant point of the Pyrenean frontier and somewhat less from the extreme point of Brittany (Cap. St. Mathieu) to the frontier east of Lauterburg. The area is now 212,659 sq.m., as against 207,170 sq.m. before 1918, the area of Corsica (3,367 sq.m.) being included in both totals.

Geology.—Many years ago it was pointed out by Elie de Beaumont and Dufrenoy that the Jurassic rocks of France form upon the map an incomplete figure of 8. Within the northern circle of the 8 lie the Mesozoic and Tertiary beds of the Paris basin, dipping inwards; within the southern circle lie the ancient rocks of the Central Plateau, from which the later beds dip outwards. Outside the northern circle lie on the west the folded Palaeozoic rocks of Brittany, and on the north the palaeozoic *massif* of the Ardennes. Outside the southern circle lie on the west the Mesozoic and Tertiary beds of the basin of the Garonne, with the Pyrenees beyond, and on the east the Mesozoic and Tertiary beds of the valley of the Rhône, with the Alps beyond.

In the geological history of France there have been two great periods of folding since Archaean times. The first of these occurred towards the close of the Palaeozoic era, when a great mountain system was raised in the north running approximately from east to west and another chain arose in the south, running from south-west to north-east. Of the former the remnants are now seen in Brittany and the Ardennes; of the latter the Cévennes and the Montagnes Noires are the last traces visible on the surface. The second great folding took place in Tertiary times, and to it was due the final elevation of the Jura and the Western Alps and of the Pyrenees. No great mountain chain was ever raised by a single effort, and folding went on to some extent in other periods besides those mentioned. There were, moreover, other and broader oscillations which raised or lowered extensive areas without much crumpling of the strata, and to these are due some of the most important breaks in the geological series.

The oldest rocks, the gneisses and schists of the Archaean period, form nearly the whole of the Central Plateau, and are also exposed in the axes of the folds in Brittany. The Central Plateau has probably been a land mass ever since this period, but the rest of the country was flooded by the Palaeozoic sea. The earlier deposits of that sea now rise to the surface in Brittany, the Ardennes, the Montagnes Noires and the Cévennes, and in all these regions they are intensely folded. Towards the close of the Palaeozoic era France had become a part of a great continent; in the north the Coal Measures of the Boulonnais and the Nord were laid down in direct connection with those of Belgium and England, while in the Central Plateau the Coal Measures were deposited in isolated and scattered basins. The Permian and Triassic deposits were also, for the most part, of continental origin; but with the formation of the Rhaetic beds the sea again began to spread and throughout the greater part of the Jurassic period it covered nearly the whole of the country except the Central Plateau, Brittany and the Ardennes. Towards the end of the period, however, during the deposition of the Portlandian beds, the sea again retreated, and in the early part of the Cretaceous period was limited (in France) to the catchment basins of the Saône and Rhône—in the Paris basin the contemporaneous deposits were chiefly estuarine and were confined to the northern and eastern rim.

Beginning with the Aptian and Albian the sea again gradually spread over the country and attained its maximum in the early part of the Senonian epoch, when once more the ancient massifs of the Central Plateau, Brittany and the Ardennes, alone rose above the waves. There was still, however, a well-marked differ-

ence between the deposits of the northern and the southern parts of France, the former consisting of chalk, as in England, and the latter of sandstones and limestones with hippurites. During the later part of the Cretaceous period the sea gradually retreated and left the whole country dry.

During the Tertiary period arms of the sea spread into France—in the Paris basin from the north, in the basins of the Loire and the Garonne from the west, and in the Rhône area from the south. The changes, however, were too numerous and complex to be dealt with here.

In France, as in Great Britain, volcanic eruptions occurred during several of the Palaeozoic periods, but during the Mesozoic era the country was free from outbursts, except in the regions of the Alps and Pyrenees. In Tertiary times the Central Plateau was the theatre of great volcanic activity from the Miocene to the Pleistocene periods, and many of the volcanoes remain as nearly perfect cones to the present day. The rocks are mainly basalts and andesites, together with trachytes and phonolites, and some of the basaltic flows are of enormous extent.

GENERAL DESCRIPTIVE GEOGRAPHY

France, situated between the Mediterranean sea on the south-east and the Atlantic and English channel on the west and north furnishes natural routes via the Rhone-Saône over the Côte d'Or scarp to the Seine, and via the Garonne from sea to sea, and thus continues the westward routes of the Mediterranean, a fact of the utmost importance throughout the country's history. As, also, the Strait of Dover is the natural westward end of the European plain, France continues southward the routes westward along that plain; and this fact has been of tragic consequence to her. The relations of France to both these great routes of civilization and of war gives that country a special function as an intermediary between south and north, between Roman and non-Roman in Europe.

The natural units that make up the country include three great river basins, the Paris basin (Somme, Seine and Loire), the Rhône-Saône basin and the Garonne basin, set respectively north, east and south-west of a block of highland (culminating at Puy de Sancy in the Mont Dore, 6,188 ft.) that forms barely one-sixth of the total area of France and is called the Central Plateau. Whereas on the north the Central Plateau forms the southern framework of the very large Paris basin, while its north-eastward annexe, Le Morvan, contributes to the basin's eastern framework, the southern fringe of the plateau (Montagnes Noires) projects so far towards the Pyrenees that there is left only the narrow gap of Carcassonne. The lowlands of south France are thus markedly divided into Mediterranean or Rhône lowlands and Aquitainian or Garonne lowlands, using the river names broadly in each case.

The highland framework partly surrounding the Paris basin is continued beyond the Morvan by the lower Côte d'Or scarp, astride of which stretched the nucleus of Burgundy. Beyond this again the Vosges (4,668 ft.) and the Ardennes continue the framework and the changes effected by the treaty of Versailles have removed the frontier from the slopes overlooking the north-east of the basin to slopes at times looking down towards Germany. It is characteristic of the collecting streams of the north-east of the Paris basin, the Meuse and Moselle, that a complex history has diverted them away from the basin northward to cut deep trenches in the Ardennes-Eifel highland block of old rocks. To the west the Paris basin is framed by the old rocks of Brittany and Normandy which, unlike those of the Central Plateau, reach above the 1,000-ft. contour only in a few places. The coasts of Normandy and Brittany show the effects of a sinking movement which has given them long estuaries and fringing islands, Ré, Oléron, Belle Île, Houat, Hoedic, Île de Groix, Îles de Sein, Ouessant, the Channel Islands, etc. This western area of old rocks and maritime activities constitutes a region of France to be added to the four (the three great basins and their frameworks, and the Central Plateau) already mentioned. Alsace constitutes a sixth, being on and under the Rhineward slope of the Vosges and thus right beyond the Paris basin; to this region also belong parts at least of Lorraine. Where the mountain framework of a

basin is broad, as on the east side of the French Rhône, one might speak of still another region, that of the high mountains. One might also note that the old rocks of the Massif des Maures, and especially their seaward southern slopes, can be named as a small region apart, but these are merely outstanding examples to illustrate the possibilities of indefinite subdivision and complication of any classification.

The Rhône-Saône Basin.—The Rhône-Saône basin is a long north-south corridor with the Alps and the Jura on the east, ranged in a line that shows how the mountain folds advancing westward have been stopped by the resistance of the old mass of the Central Plateau and the Morvan. The river runs along this corridor near the foot of the steep edge of the Central Plateau. The corridor is narrow for a considerable part of the lower course of the Rhône where the Alpine folds come nearest the Central Plateau, and this narrow portion makes a considerable break between Provence and Languedoc towards the delta, and the region above Lyons where the mountain folds of the Jura make a convex curve between the north end of the Central Plateau and the south end of the Vosges. The Morvan and the Plateau de Langres are the heights on the west with the Côte d'Or as the limestone scarp under which runs the Saône. The feeders of the Rhône-Saône are of course mainly from the east, the Durance and Isère drain mountain areas in the Alps, the Rhône itself comes through from the east between the Jura and the main Alps and the Ain and the Doubs drain the Jura. The climate in the lower Rhône is one of summer heat and drought with a winter that is really mild only in places sheltered from the air currents streaming from the plateau (the Mistral winds) or from the mountains to the seasonal low pressure centre over the north-west Mediterranean. The spring is delightful apart from the Mistral which, however, does not blow very often at that time. It is a region in which, with wind screens, vines may be grown as field crops and the olive thrives about as far north as Pierrelatte. It is possible to grow choice early vegetables and there is pasture for cattle in the winter on the lowlands; many are sent up to the highlands for the summer.

The lower Rhône is essentially a region of Mediterranean civilization with cities often of Roman and even pre-Roman heritage—Orange, Avignon, Arles, Nîmes, Marseille, etc. Farther north in the corridor the summer is less hot though again fairly dry, but the winter is too cold for the olive; the climate suits the mulberry about as far north as Lyons, beyond which the broader corridor has on and under its slopes facing south-east some of the choice vineyards of Burgundy. It is a region of vine and maize with stock and poultry farming on a good scale east of the Saône (in Bresse) and its forest growth is that of central Europe rather than that of the Mediterranean. Its cities are largely determined by their important lines of communication—Lyons, Dijon, Belfort. Both the Alps and the Jura have important local capitals within their limits in France, the former Grenoble, the latter Besançon.

The Garonne Basin.—The Garonne-Dordogne basin is south-west France, essentially a triangle framed by the Central Plateau, the Pyrenees and Bay of Biscay. The exposure to the sea gives a marked rainfall against the hill frame and this shows its effect in the great tributaries of the Garonne on both flanks, but especially on the left on which side Tarn, Aveyron, Lot and Dordogne have cut back long subparallel valleys. The Adour drains the south-west corner separately. The triangle mentioned above is incomplete; there is a lowland way between the Central Plateau and the sea, the gate of Poitiers as it is often called. It has Bordeaux on its south-west side. There is also a narrow lowland way between the southern end of the Central Plateau and the Pyrenees, and this is the gap of Carcassonne with Toulouse on its west, Carcassonne itself at the critical point and Narbonne on the east. These facts concerning communications help to show how it is that this region has two major focal towns, Bordeaux and Toulouse. The climate is more moist than in the Rhône-Saône region and slightly less hot in summer; it does not suit the olive, but is famed for vines and maize, the wine being typically less ferruginous than in Burgundy. The chestnut

abounds towards its northern border in the Périgord.

The Central Plateau.—In the west the granites give poor, cold soil; its Jurassic limestone areas (Causses) to the south-west and south are for the most part so bare as to be almost desertic, but parts may once have had a natural forest covering and the valleys are often rich. The volcanic ranges are often high and bare, but parts of the lands around them are famed for their pastures, while the upper courses of the Loire and Allier form bays in the north side of the plateau, in the beds of ancient lakes, the Allier flowing through the fertile Limagne which gives a site to the focus of a large region, a focus that once was Gergovia and now is Clermont Ferrand. On the high plateau it often happens that the river valleys are relatively broad with pastures and beech woods and a good population so long as they remain in the volcanic region, but farther down the river may cut through the hard ancient rocks and there it forms a gorge that is almost uninhabited. There are small basins on the high plateau with historic towns that may have castles or churches on sharply outstanding volcanic rocks and the whole region may be said to have received many contributions to its life from the south, though legal and linguistic features have spread a good way up from the northern plain, through hillside foci such as Clermont Ferrand and Limoges.

Apart from the coal area of St. Etienne the region is poor, and many of its departments have lost over 10% of their population within the 20th century. The wildness of some districts is illustrated by the fact that the wolf still lingers on the Central Plateau. The winters are severe on the heights and snow is abundant, the summer is moderate on the heights but hot in the lowlands. The contrasts between the olive-vine region below the plateau on the south-east and the mountain valleys, often between limestone hills, is a striking one and is the contrast of the setting of Roman Catholic and Huguenot elements in French religious life, though the psychological contrast has many other contributory factors besides the environmental one.

The Paris Basin.—This basin (of Seine and Loire) is flooded by a succession of rocks arranged as a nest of saucers so that the successive saucer edges stand out as scarps facing outwards in each case. The command of any of these scarps by an army allows it to overlook the inward facing dip slopes. The centre is formed of Tertiary rocks including the corn growing calcareous plateau of Beauce (Pliocene) continued southward into the muddy Sologne, full of marshes and lakelets, and north-eastward to the Marne in the Brie, argillaceous save towards the Marne.

The Eocene beds crop out around the Pliocene and vary in character, but are often sandy and forested, the *forêt de Compiègne* and other forests, which stretch south, east of the Oise and often overlook swamps where these Tertiary beds die out westwards near the Oise, forming a boundary zone of old between Belgica to the north and Celtica to the south. Several areas of this formation to the south are fairly barren and may bear a name allied to Gâtine, and this frontier nature of the Eocene country is interesting as a factor of the rise of the French monarchy in the centre of the Paris basin. Around this centre comes zone after zone of rock, chalk in dry Champagne, Lower Cretaceous clays, followed by Upper Jurassic limestones and free stones sharply scarped at the Côte d'Or and fairly prominently edged along the west bank of the Moselle. The Lower Jurassic or Lias with its less permeable rocks has gathered to itself long stretches of new courses in the north-east. Beyond this the framework of the basin varies, with the Ardennes on the north, but a belt of Triassic upland reaching the Vosges on the east. Between Ardennes and Vosges the Hunsrück and related heights reach the border of Lorraine, but on either side of these latter are ways to the Rhine that have made of Lorraine a region of transition and of strife. This border of the basin has hard winters and hot summers with a good deal of rain. The Vosges are high and wild enough to have wolves.

On the southern edge of the Paris basin is the Central Plateau but on the west the succession of outcropping rocks is not nearly so complete as on the east and the old rocks of the Armorican system are reached giving the denuded and dissected plateau of western France with its sunken estuaries and its seaward outlook. Here

Brittany stands out, and to the south of it the Loire, draining the south of the Paris basin, cuts through the old rocks before it reaches its estuary below Nantes. It thus has a course which it acquired at some stage of its history through diversion and at the critical bend stands Orléans of great historic and strategic importance for that very reason. The fine valley to the south-west with its great *châteaux* and its tradition of cultured French speech is *La Touraine*. North of Brittany the west of Normandy is a part of this plateau of old rocks but beyond it the Seine estuary has given opportunities for maritime traditions in a country of the chalk rim of the Paris basin. The Seine draining the centre of the basin passes from the Eocene, with a good deal of forest near its border, to the chalk through which it has cut a rather deep trough so that there is an old frontier region along and on either side of the river, Le Vexin français on the Eocene and Le Vexin Normand on the chalk.

On the north the Paris basin has a broad zone of chalk with anticlines and synclines that give rise to small scarps and valleys famous in the World War, and beyond lies the plain of Flanders, offering a much easier approach to the Paris basin than do the ways through Lorraine, with the result that Flanders is the greatest battlefield of European history. The focusing of the basin on Paris is extraordinarily complete and has contributed much to the centralization so characteristic of French life and organization, but the "ways" into and out of the basin via Flanders, Lorraine and Belfort to the north and east have constrained Paris to maintain centralization in view of the needs of defence. The Paris basin, with a rainfall in many parts of only 23-25 in. and fairly cold winters, has a sunny summer of moderate warmth admirable for ripening wheat and permitting the growth of the vine in selected spots which accordingly grow choice fruit as at Reims, Epernay and Saumur. Towards the west the vine gives place to the apple and cider becomes the beverage, while stock-rearing becomes more prominent in agriculture under the influence of Atlantic rains. The Paris basin is essentially a corn-land rich in old market towns and dominated in unique fashion by the city of Paris.

POPULATION

The work of Broca and of Collignon in the 19th century was of pioneer importance for the study of physical type in man-

GRAPH SHOWING POPULATION OF FRANCE, 1801-1926. THE HEAVY LINE REPRESENTS POPULATION OF THE POLITICAL UNIT AT EACH CENSUS. THE LIGHT LINE FROM 1801 TO 1872 AND FROM 1911 TO 1926 OMITTS THE POPULATION OF ALSACE-LORRAINE

kind. They showed that the central plateau and parts of the French Alps, together with parts of the surrounding lowlands, especially those south of the Seine and near the Garonne, were characterized by a short, thick-set, brown-haired, broad-headed population, which Broca called Celtic but which have come to be known as Alpine. They are a large element in the thrifty,

hardworking peasantry, serious and deeply attached to their fields and villages. In the south-west, where the Basque language (*q.v.*) survives, this type mingles with a long-headed dark element widely distributed around the western Mediterranean and known as the Mediterranean race; this is also found in Languedoc and Provence. In Burgundy and the Jura, one finds tall men, often fairly dark, with rather long faces. In the north of France the Alpine type is mingled with and influenced by tall fair types from farther north, the Franks being doubtless one of many contributing elements here. The Seine entry and the coasts of Normandy and Brittany also have tall, fair types of Scandinavian origin, and on the Breton coasts, for example near Binic and Paimpol, and in the Morbihan are tall, dark, broad-headed people comparable with similar groups found on the coasts of the Iberian peninsula, the west coasts of Great Britain, etc.; these last are apparently descendants of men who spread along the Atlantic coasts in connection with some phase of pre-historic trade. (*See EUROPE, Ethnology.*)

France thus possesses considerable numbers of almost every physical type found in western Europe or, indeed, if the Burgundians be allowed to be related to Dinaric types (*see EUROPE, Ethnology*), of almost all those found in Europe save the Arctic north and the Asiatic border. Collignon rightly emphasized the survival of types known from the late Palaeolithic, especially in the basin of the Dordogne. The contrasts between the stability of the totals of population in France in the 19th century and the phenomenal increase in Great Britain and between the extreme urbanization of population in England and the large rural element in France are commonplace. They need to be understood, however, with some reserves, for there has been in France a marked tendency to urbanization, continued and increased of late years. In the 20th century also there has been an immense loss of manhood through the World War; the maintenance of the totals is in part due to immigration of, chiefly, Italian, Spanish, Slavonic and Belgian elements. The following tables of population illustrate the changes in the 20th century and show that there has been a widespread decrease of population on the Central Plateau and in the east and south-east of the Paris basin as well as in the Garonne basin and the French Alps. The departments which show increases are two around Paris, that of the lower Seine with Le Havre and Rouen, those of Nord and Pas de Calais with their industrial developments, that of Meurthe et Moselle with its iron industry, those including Lyons, St. Étienne, Bordeaux, Marseille, and most of those on the Mediterranean coast save Gard and Aude. Ports and other cities have grown, the countryside has less people.

The recent change in this direction is illustrated by the following table—

	1921	1926
Number of Communes with 5,001-10,000 inhabitants	394	429
Number of Communes with 10,001-20,000 inhabitants	175	207
Number of Communes with 20,001 inhabitants and over	140	159
Number of Towns with over 100,000 inhabitants	15	17

The departments which showed actual decreases in the period 1921-26 were Allier, Basses Alpes, Hautes Alpes, Ardèche, Ariège, Aveyron, Cantal, Charente, Charente Inférieure (slight), Cher, Corrèze, Côtes du Nord, Creuse, Dordogne, Finistère, Indre, Landes, Loir et Cher, Haute Loire, Lot, Lozère, Haute Marne, Mayenne, Morbihan, Nièvre, Haute Saône, Saône et Loire, Sarthe, Deux-Sèvres (slight), Vendée and Vosges. These are all rural departments and in several cases are difficult highland country.

France has a total population of 40,743,851, or nearly 191.6 per square mile, a relatively low density for a country of old settlement and varied resources like France. The total in 1921 was 39,209,766, but of this increase of 1,534,085 no less than 957,176 was due to an increase in the number of aliens from 1,550,459 to 2,507,635 or rather more than 6.1% of the population. France has become a country of immigration and the alien element is

over 10% in the following departments:—Alpes Maritimes (nearly 30), Ardennes (about 10), Aude (over 10), Bouches du Rhone (over 19), Hérault (over 11), Meurthe et Moselle (over 14), Moselle (about 18), Nord (nearly 12), Pas de Calais (13), Pyrénées Orientales (over 14), Var (over 17). The importance of immigration is further appreciated when it is realized that Alpes Maritimes, Var, Bouches du Rhone, Hérault, Pyrénées Orientales, Meurthe et Moselle, Nord and Pas de Calais are among the small number of departments that show increase of population in the 20th century. The situation in France thus is that a very slow increase of native population with a gradual drift to the towns, away from the regions of difficulty, is going on alongside of a considerable movement of immigration, chiefly to industrial centres. The figures above are from the official returns of the 1926 census as corrected by a supplementary decree of Feb. 8, 1927.

The large cities of France in order of population are as follows:—

Paris (strict limits)	2,871,429
Greater Paris (Dept. of Seine)	4,628,637
Marseille	652,196
Lyons	570,840
Bordeaux	256,026*
Lille	201,921
Saint Etienne	193,737
Nantes	184,509
Nice	184,441
Toulouse	180,771
Strasbourg	174,492
Le Havre	158,022*
Rouen	122,808*
Roubaix	117,309
Toulon	115,120
Nancy	114,491
Clermont Ferrand	111,711
Reims	100,998

*Show small decreases since 1921.

The birth rate was 20.5 per 1,000 for the decade 1901-11 and by 1925 it had fallen only to 19.6, thus contrasting markedly with the British one which in 1927 was only 16.6. The death rate of over 21 per 1,000 in the last decade of the 19th century had declined to 17.6 in 1913, but rose as a result of war dislocation and was 18.1 in 1925. This is much higher than the British death rate has been for a long time. The conditions in France, with a still largely rural population, are such as to make care of infants and general sanitation more difficult than they are in general in industrialized Britain and the warm summers tend to make any defects of sanitation more dangerous still.

The occupations of the active population were as follows in 1921:—

Agriculture and forestry	8,951,099
Fishing	72,450
Mining and quarrying	317,607
Manufactures	6,181,441
Transport	1,184,414
Commerce, including banks	2,253,529
Liberal professions	590,492
Domestic service	847,566
Public service	1,322,006

The liberal professions show a marked increase and domestic service a marked decrease as compared with the early part of this century, changes that are noticeable in many countries. Transport work also occupies many more than it did 25 years ago because of the road motor.

Constitution.—On Sept. 4, 1870, a republic was proclaimed in France and the main points in the national organization were fixed by the constitutional laws of 1875, with amendments of detail made in 1879, 1884 and 1926. The Constituent National Assembly is formed of the Senate and the Chamber of Deputies (*v. inf.*) sitting together at Versailles, and this assembly has charge of the constitution and also meets to elect the president of the republic who is eligible to hold office for seven years and may be re-elected. He has to be elected by an absolute majority of votes cast in the National Assembly. The president of the council of ministers (*Angl.* "premier") may deputize for the president of

the republic. The powers of the president of the republic include most of those usually exercised by a constitutional monarch. With the concurrence of the Senate he can dissolve the Chamber of Deputies, he can call it and the Senate to meet in extraordinary session and can adjourn them for a period not exceeding one month; he can also send messages to them, and can refer their decisions back to them for reconsideration. He is responsible in principle for the making of wars and treaties. Every act of the president must be countersigned by a minister and his messages are communicated by a minister; he chooses the president of the council of ministers and is liable to attainder only by the Chamber of Deputies and to trial only by the Senate constituted as a high court. With allowances for establishments and travel, the president receives about two million francs per annum. The council of ministers is nominated by its president after the latter has been chosen by the president of the republic. The actual appointments are made by the latter who has the right to preside at the council, but there are unofficial cabinet meetings for most political purposes and he does not attend these. A minister is responsible to the Senate and Chamber of Deputies, he can enter and claim to be heard in either chamber, he is responsible for a department of government, and responsible conjointly with his colleagues for the government in general. A minister is paid 100,000 fr. per annum.

The legislative chambers make laws, control the executive and exercise special powers mentioned under each; the constitution provides for these sessions, adjournments and dissolutions. These chambers are the Senate and the Chamber of Deputies.

The Senate is elected by an electoral college system, one-third of its members vacating their seats every third year so that the whole is renewed during each period of nine years. The "thirds" are reckoned in departments. "A" includes the departments in alphabetical order from Ain to Gard, also Alger, Guadeloupe and Réunion, total 96 seats. "B" includes the departments from Garonne (Haute) to Oise, also Constantine and Martinique, total 106 seats. "C" includes the departments from Orne to Yonne, also Oran and the French establishments in India, total 98 seats. This accounts for 300 seats in addition to which there are seats for ministers who may not be members of the Senate, but though a minister may sit in both houses without necessarily being a member, he may vote only in a house of which he is a member.

The Senate may sit as a court of justice to try a president of the republic or a minister on the accusation of the Chamber of Deputies or to try a case in which national safety is involved. A senator receives 60,000 fr. per annum. The electoral college system provides that in each department concerned a college shall assemble. It is composed of the deputies, general councillors, councillors of the *arrondissements* and representatives of municipal councils, a council of 10 members appointing one representative, a council of 12 members two, a council of 16 members three and so forth. A senator must be a person with full civil rights and over 40 years old.

The Chamber of Deputies has at present 568 members elected every four years by France and Corsica, together with 16 members elected by Algeria, and certain other French possessions

abroad which are held to have reached an appropriate stage of development, Cochinchina having one representative in the Chamber of Deputies, though it has none in the Senate. In France, apart from the territory of Belfort, which elects two deputies, there is one deputy for every 75,000 inhabitants and an additional one in any department with a residuum of more than 37,000 inhabitants.

The total number of deputies thus varies with the population. Every male citizen over 21 years of age free of legal disabilities is a voter, provided he has resided six months in any one commune, but a deputy must be over 25. The voting is by lists for each constituency, an electoral college allocating the seats according to the votes cast; it is composed of general councillors nominated by the prefect of the department. Algeria has six deputies and other French possessions concerned have 10, their numbers being fixed by law. A deputy receives 60,000¹ fr. per annum.

The Senate and Chamber of Deputies both have legislative initiative and can demand that the president shall convoke them, one-half of the members of each having to agree for this purpose. Financial initiative and the power of accusation of a president or a minister before a court belong to the Chamber of Deputies alone. The members of former reigning families are not permitted to become senators or deputies.

If a bill be presented to the Chamber of Deputies, it is referred to a bureau for examination and report, after which it must go through the chamber twice before being presented to the Senate. If it be presented to the Senate, it is referred to a commission of parliamentary initiative for report, after which it must go through the Senate twice before being presented to the Chamber of Deputies. Either the Senate or the Chamber of Deputies may pass a vote of no confidence in the Government, but the Government resigns usually only on such a vote passed by the Chamber of Deputies. The Senate cannot be dissolved and the president may dissolve the Chamber of Deputies only with the consent of the Senate. Mention should here be made of the Council of State, the King's Council under the old monarchy, suppressed at the Revolution and re-established under Napoleon.

The Council of State (*conseil d'état*) is the principal council of the head of the State and his ministers, who consult it on various legislative problems, more particularly on questions of administration. It is divided for dispatch of business into four sections, each of which corresponds to a group of two or three ministerial departments, and is composed of (1) 32 councillors "*en service ordinaire*" (comprising a vice-president and sectional presidents), and 19 councillors "*en service extraordinaire*," i.e., Government officials who are deputed to watch the interest of the ministerial departments to which they belong, and in matters not concerned with those departments have a merely consultative position; (2) 32 *maîtres des requêtes*; (3) 40 auditors.

The presidency of the Council of State belongs *ex officio* to the minister of Justice. The theory of "*droit administratif*" lays down the principle that an agent of the Government cannot be prosecuted or sued for acts relating to his administrative functions before the ordinary tribunals. Consequently there is a special system of administrative jurisdiction for the trial of "*le contentieux administratif*" or disputes in which the administration is concerned.

Local Government.—According to the census of 1926, France, including Corsica, consisted of 90 departments, with 279 *arrondissements*, 106 having been suppressed in 1926, 3,024 cantons and 37,981 communes. Before the Act of 1926 the *préfet* of each department, elected by the president, was advised by an elected council, but now only the department of Seine has such a council, the others are grouped under 22 councils which are thus inter-departmental. A department is divided into *arrondissements*, each with a *sous-préfet* advised by a council elected by the cantons. Each commune has a mayor advised by an elected municipal council, with numbers regulated by the census returns save in the case of Paris, which has a council of 80 members; these coun-

cils are re-elected every four years. The elected councils of the *préfet*, etc., are chosen by universal suffrage. The *préfets*, *sous-préfets* and *maires de communes* are nominees of the central authority and are entrusted with local headship of administration. Simplifications effected in 1926 were made for the sake of economy and in view of the diminution of population in many remote areas. The general council advising the *préfet* superintends public property and assigns amounts of tax revenue to be raised by each *arrondissement*; it has no concern with political controversy. The *sous-préfet* allocates amounts of tax revenue to be raised by each canton. Each canton is the seat of a justice of the peace and is the unit for elections to the general council and the council of the *arrondissement*. The *maire* is the executive officer of the commune, looks after police, revenue, public works, civil registration, etc. In small communes he has one deputy, in larger ones he has more.

JUSTICE

The ordinary judicial system of France comprises two classes of courts: (1) civil and criminal, (2) special, including courts dealing only with purely commercial cases; in addition there are the administrative courts, including bodies, the Conseil d'État and the Conseils de Préfecture, which deal, in their judicial capacity, with cases coming under the *droit administratif*. Mention may also be made of the Tribunal des Conflits, a special court whose function it is to decide which is the competent tribunal when an administrative and a judicial court both claim or refuse to deal with a given case.

Taking the first class of courts, which have both civil and criminal jurisdiction, the lowest tribunal in the system is that of the *juge de paix*. In each canton is a *juge de paix* who in his capacity as a civil judge takes cognizance, without appeal, of disputes concerning small amounts, but where larger amounts are concerned there is an appeal to the court of first instance. Criminal affairs are treated similarly. It is an important function of the *juge de paix* to endeavour to reconcile disputants who come before him, and no suit can be brought before the court of first instance until he has endeavoured without success to bring the parties to an agreement. Tribunals of first instance consider appeals from the *juges de paix* and initiate consideration of somewhat larger civil cases. An appeal from them in cases above a certain amount lies to the courts of appeal. When sitting as a criminal court the tribunals of first instance are known as correctional tribunals and their decisions are subject to revision by the courts of appeal. Tribunals of first instance formerly existed in each *arrondissement*, but in 1926 they were restricted to one in the capital of each department, the bigger departments having sections of the tribunal in other towns. Above the tribunals of first instance stand the 26 courts of appeal instituted for groups of departments at Paris, Agen, Aix, Amiens, Angers, Bastia, Besançon, Bordeaux, Bourges, Caen, Chambéry, Dijon, Douai, Grenoble, Limoges, Lyons, Montpellier, Nancy, Nîmes, Orléans, Pau, Poitiers, Rennes, Riom, Rouen, Toulouse. The departments of Haut Rhin, Bas-Rhin, Moselle, that is, Alsace-Lorraine as returned to France after 1918, are not included in the above scheme, being still under special arrangements in several respects.

At the head of each court, which is divided into sections (*chambres*), is a *premier président*. Each section (*chambre*) consists of a *président de chambre* and four judges (*conseillers*). *Procureurs-généraux* and *avocats-généraux* are also attached to the *parquet*, or permanent official staff, of the courts of appeal. The principal function of these courts is the hearing of appeals both civil and criminal from the courts of first instance; only in some few cases (e.g., discharge of bankrupts) do they exercise an original jurisdiction. One of the sections is termed the *chambre des mises en accusation*. Its function is to examine criminal cases and to decide whether they shall be referred for trial to the lower courts or the *cours d'assises*. It may also dismiss a case on grounds of insufficient evidence.

The *cours d'assises* are not separate and permanent tribunals—they are held in the departmental capitals by a *conseiller* appointed *ad hoc* of the court of appeal upon which the department depends.

¹The salaries of senators and deputies, which were only augmented to 60,000 fr. from 45,000 at the end of 1928, are expected shortly to be again increased to 75,000 fr.

The *cour d'assises* deals with serious criminal cases. The president is assisted in his duties by two other magistrates, who may be chosen either from among the *conseillers* of the court of appeal or the presidents or judges of the local court of first instance. In this court and in this court alone there is always a jury of twelve. They decide, as in England, on facts only, leaving the application of the law to the judges. The verdict is given by a simple majority.

In all criminal prosecutions, other than those coming before the *juge de paix*, a secret preliminary investigation is made by an official called a *juge d'instruction*. He may either dismiss the case at once by an order of "*non-lieu*," or order it to be tried, when the prosecution is undertaken by the *procureur* or *procureur-général*. This process in some degrees corresponds to the manner in which English magistrates dismiss a case or commit the prisoner to quarter sessions or assizes, but the powers of the *juge d'instruction* are greater.

The highest tribunal in France is the *cour de cassation*, sitting at Paris, and consisting of a first president, three sectional presidents and 45 *conseillers*, with a ministerial staff (*parquet*) consisting of a *procureur-général* and six advocates-general. It is divided into three sections: the *chambre des requêtes*, or court of petitions, the civil court and the criminal court. The *cour de cassation* can review the decision of any other tribunal, except administrative courts. Criminal appeals usually go straight to the criminal section, while civil appeals are generally taken before the *chambre des requêtes*, where they undergo a preliminary examination. If the demand for rehearing is refused such refusal is final; but if it is granted the case is then heard by the civil chamber, and after argument *cassation* (annulment) is granted or refused. The *cour de cassation* does not give the ultimate decision on a case; it pronounces, not on the question of fact, but on the legal principle at issue, or the competence of the court giving the original decision. Any decision, even one of a *cour d'assises*, may be brought before it in the last resort, and may be *cassé*—annulled. If it pronounces *cassation* it remits the case to the hearing of the court of the same order as that from which it came.

Commercial courts (*tribunaux de commerce*) are established in all the more important commercial towns to decide as expeditiously as possible disputed points arising out of business transactions. They consist of judges, chosen from among the leading merchants, and elected by *commerçants patentés depuis cinq ans*, i.e., persons who have held the licence to trade (see FINANCE) for five years and upwards.

In important industrial towns tribunals called *conseils de prud'hommes*, or boards of trade-arbitrators, are instituted to deal with disputes between employers and employees, actions arising out of contracts of apprenticeship and the like. They are composed of employers and workmen in equal numbers and are established by decree of the Council of State, advised by the minister of Justice. The minister of Justice is notified of the necessity for a *conseil de prud'hommes* by the *préfet*, acting on the advice of the municipal council and the Chamber of Commerce or the Chamber of Arts and Manufactures. The judges are elected by employers and workmen of a certain standing.

Police.—The judicial police under the *maires* and *juges de paix* include *commissaires de police*, the *gendarmerie*, and, in the country, *gardes champêtres* and *gardes forestiers*. These are specially concerned with the detection of criminals and the gathering of evidence. Special branches include *police des mœurs*, *police sanitaire*, *police politique*, etc. The administrative police correspond more or less to the police constables of Britain and include the men commonly called *sergents de ville*, *agents de police*, etc. The Paris police includes in addition to the judicial and administrative police above mentioned, an organization under the *préfet* which has charge of the safety of the president of the republic and of the regulation of ceremonies, amusements, etc. There is also in Paris the *police municipale* concerned with traffic control and allied matters. There are *depôts de sûreté* more or less corresponding to British police stations, departmental prisons in most but not all departments, central prisons for long term prisoners, and convict stations—one at *St. Martin-de-Ré*, and one in French

Guiana. There are reformatories for young delinquents.

Public assistance is given to the poor through *bureaux de bien-faisance* which also have endowments and charitable contributions, and there are many ecclesiastical charities. Public institutions take charge of destitute children. An old age pensions scheme was inaugurated in 1910 and amended in 1912 and provides for contributions from each worker up to his 60th year with a State contribution of 100 fr. increased in cases where a worker has brought up at least three children to the age of at least 16. Maternity help has been legally established and, since 1923, 90 fr. per annum is given to a family of more than three children so long as the additional children are under 13.

RELIGION

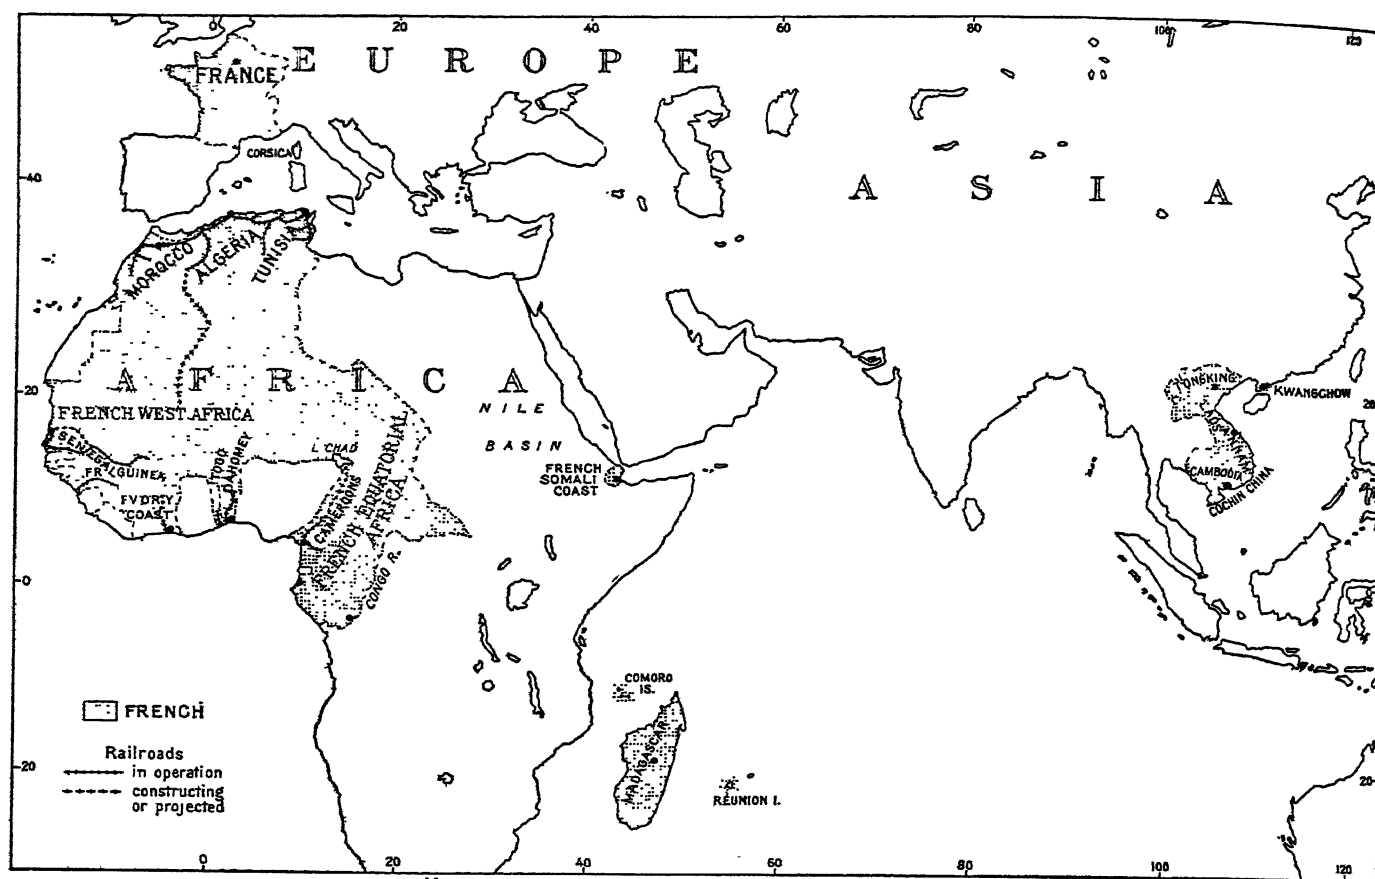

Since 1905 Church and State have been separated by law and public funds are no longer chargeable with the salaries of clergy. Religious organizations are not allowed to organize public schools save in the case of special schools training persons for educational service abroad, and such organizations as the religious orders of the Roman Catholic Church must have the State's authorization before they can exist in France. These arrangements apply to the whole of France save the departments of Moselle, Bas-Rhin and Haut Rhin, which were called Alsace-Lorraine, 1871-1918, under German rule; in these departments a special régime prevails. The historic religious organization of France is the Roman Catholic Church, the hierarchy of which in the country includes archbishoprics at Aix, Albi, Auch, Avignon, Besançon, Bordeaux, Bourges, Cambrai, Chambéry, Lyons, Paris, Reims, Rennes, Rouen, Sens, Toulouse and Tours. In addition to these 17 archbishoprics there are 71 bishoprics and the tendency has been in the main to make the sees correspond with the departments. The sees are divided into deaneries and the ultimate unit is the parish served by a *curé* or *desservant* (incumbent) who may be assisted by a *vicaire*. The training for the priesthood is given in *séminaires*, the lower ones being in part equivalents of grammar schools, the higher ones more strictly theological colleges.

Protestantism has an interesting history in France having developed, chiefly under Calvinistic influences, in various centres in the 16th century, while Lutheran ideas spread in parts of the North-east (Montbéliard, etc.). The revocation of the Edict of Nantes in 1685 led to the depletion of the Protestant population which had enjoyed a measure of toleration under that edict, and was specially strong in some districts which had been Albigensian in the 13th century. With the re-establishment of ideas of toleration various British and other religious bodies founded groups in France and the following organizations now exist: *Eglises réformées*, *Eglises réformées évangéliques*, *Eglise évangélique luthérienne de France*, *Eglise de la Confession d'Augsbourg (luthérienne)*, *Société centrale évangélique*, *Union des églises évangéliques libres de France*, *Eglise évangélique méthodiste de France*, *Eglises baptistes de langue française*. In accordance with the law of separation of Church and State (1905) the Protestants have formed *associations cultuelles*. There is a Protestant Federation with a lay president. The Protestants of France may number about 1,000,000 souls, chiefly in Montbéliard, Alsace, Paris, the Cevennes, and a few isolated towns for the most part in the south.

The Jewish religion has adherents chiefly in certain cities such as Paris, Lyons, Nancy, Bordeaux, etc., and is organized on the basis of *associations cultuelles*. There are a few North African Mohammedans in France, many of them in and near Paris.

FOREIGN POSSESSIONS

The foreign possessions of France are in two historic groups. First the remains of the old colonies, Saint Pierre and Miquelon, on the Canadian coast; Martinique and Guadeloupe, with their dependencies, in the West Indies; Guiana in South America; five enclaves in British East India, Pondicherry being the most important; Réunion, in the Indian ocean, near Mauritius, a relic of the match between Bougainville and Cook. These are, if one likes to call them so, the aristocratic colonies. The American and Indian colonies and Réunion have their deputies and senators in the French parliament. They are united with France by old bonds

MAP SHOWING FRENCH POSSESSIONS IN AFRICA AND ASIA

of affection. They have given her scholars, administrators and great men of letters. In certain cases they derive special importance from their situation on the great international routes or their great resources. But, above all, their value for France is sentimental and historic; they are the outline of the first empire lost in the 18th century. With them are sometimes reckoned Tahiti, etc. (acq. 1841 onwards), New Caledonia (acq. 1854 onwards), also the New Hebrides (held jointly with Britain). The other possessions acquired in the 19th century include Algeria and Tunisia with expansions from these that now make up a vast continuous area, while Jibuti, or French Somaliland, and Madagascar stand apart. There is also the Asiatic group of territories in Indo-China.

The following table shows the respective importance of the three groups:—

Colony	Area in sq. km.	Population
I. America, Australasia, Indian establishments, and Réunion (mainly the old colonies)	129,978	1,112,000
II. African group and Syria	9,910,710	36,890,000
III. Asiatic group	900,842	21,640,000
France (for comparison)	10,941,530	58,642,000
	550,986	40,000,000

The African group consists of Northern Africa (Algeria, Tunisia, Morocco); French West Africa (Senegal, Guinea, the Ivory Coast, Dahomey, Niger) French Equatorial Africa, which stretches from the Congo to Lake Chad and the Nile basin; Madagascar, the third largest island in the world; and the French Somali Coast, at the mouth of the Red sea. In addition, France has mandates in Togo and Cameroons. This group, by its proximity, seems specially destined to act as an extension of the mother-country. It is naturally commanded by Northern Africa, which is only 750 km. distant from France, 20 hours' journey by sea, or six hours by air. From Northern Africa the railroads and aerial routes

spread out towards the tropical and equatorial territories; it links the mother country and the other African colonies. Algeria, lying as it does between Morocco and Tunisia, is rightly considered the key position, and it has accepted a large measure of French culture. Syria, though in Asia, may be considered in this group; it is administered under mandate and so is not strictly a possession.

The Asiatic group consists of Cochin China, Cambodia, Annam, Tongking, Laos, and the territory of Kwangchow. Historic reasons have made the relations of French possessions with the Government of the republic very various. Algeria is under the Ministry of the Interior and is divided into departments, but it is not in all details of government like departments of France. The "old colonies" and the Algerian departments are represented in the Senate and the Chamber of Deputies, and Cochin China is represented in the latter. The *Conseil supérieur des Colonies* is an advisory body in Paris with representatives from the colonies. Tunisia, Morocco and Syria are under the Foreign ministry, the others under the Colonial ministry.

DEFENCE

The subject of Defence is dealt with in accordance with custom in three sections, military, naval, and air, dealing with the organization of army, navy and air forces, respectively.

MILITARY

The French army dates from the middle of the 15th century, at which time Charles VII. formed, from mercenaries who had served him in the Hundred Years' War, the *compagnies d'ordonnance*, and thus laid the foundation of a national standing army. But the armies that followed the kings in their wars still consisted mainly of mercenaries, hired for the occasion; and the work of Charles and his successors was completely undone in the confusion of the religious wars. Louvois, as minister of Louis XIV., was the true creator of the French royal army. The organization of the first standing army is here given in some detail, as it served as a model for all armies for more than a century, and is also followed to some extent in modern times. Before the advent of Louvois, the forces were royal only in name. The army was a fortuitous concourse of regiments of horse and foot, each of which was the property of its colonel. The companies similarly belonged to their captains, and, the state being then in no condition to buy out these vested interests, superior control was almost illusory. Indeed, all the well-known devices for eluding such control, for instance, showing imaginary men on the pay lists, can be traced to the French army of the 16th century. Louvois was unable indeed to overthrow the proprietary system, but he confined it to the colonels (*mestre de camp* in the cavalry) and the captains. Henceforward the colonel was a wealthy noble, with few duties beyond that of spending money freely and of exercising his court influence on behalf of his regiment. The real work of the service was done by the lieutenant-colonels and lieutenants, and the king and the minister recognized this on all occasions. Thus Vauban was given, as a reward for good service, a company in the "Picardie" regiment without purchase. Promotions from the ranks were very rare but not unknown, and all promotions were awarded according to merit except those to captain or colonel. One of the captains in a regiment was styled major, and acted as adjutant. This post was of course filled by selection and not by purchase. The grades of general officers were newly fixed by Louvois—the *brigadier*, *maréchal de camp*, lieutenant-general and marshal of France. The general principle was to give command, but not promotion, according to merit. The rank and file were recruited by voluntary enlistment for four years' service. The infantry was composed, in 1678, of the *Gardes françaises*, the Swiss guards, the old (*vieux* and *petits vieux*) regiments of the line, and the regiments raised under the new system. The *régiment du roi*, which was deliberately made the model of all others and was commanded by the celebrated Martinet, was the senior of these latter. The whole infantry arm in 1678 numbered 320,000 field and garrison troops. The cavalry consisted of the *Maison du Roi* (which Louvois converted from a "show" corps to one of the highest discipline and valour), divided into the *Gardes du Corps* and the *Mousquetaires*, the *Gendarmerie* (descended from the old feudal cavalry and the *ordonnance* companies) and the line cavalry, the whole being about 55,000 strong. There were also 10,000 dragoons. In addition to the regular army, the king could call out, in case of need, the ancient *arrière-ban* or levy, as was in fact done in 1674. In 1688 Louvois organized a militia raised by ballot. This numbered 25,000 men and proved to be better, at any rate, than the *arrière-ban*. Many infantry regiments of the line were foreign, the greater part being Swiss.

LOUVOIS' WORK

The artillery had been an industrial concern rather than an arm of the service. In sieges a sum of money was paid for each piece put in battery, and the grand master was not subordinated to the war office. But Louvois adroitly filled the post with his own nominee, and eventually formed companies of artillerymen. The engineer service, as organized by Vauban, was composed of engineers "in ordinary," and of line officers especially employed in war. Louvois further introduced the system of magazines. To ensure the regular working of supply and transport, he instituted direct control by the central executive, and stored great quantities of food in the fortresses, thereby securing for the French armies a precision and certainty in military operations which had hitherto been wanting. The higher administration of

the army, under the minister of war, fell into two branches, that of the commissaries and that of the inspecting officers. The duties of the former resembled those of a modern "routine" staff—issue of equipment, checking of returns, etc. The latter exercised functions analogous to those of a general staff, supervising the training and general efficiency of the troops. Louvois also created an excellent hospital service, mobile and stationary, founded the *Hôtel des Invalides* in Paris for the maintenance of old soldiers, established cadet schools for the training of young officers, and stimulated bravery and good conduct by reviving and creating military orders of merit.

The last half of the 17th century is a brilliant period in the annals of the French armies. Thoroughly organized, and led by such generals as Condé, Turenne, Luxembourg, Catinat and Vendôme, they made head against coalitions which embraced nearly all the powers of Europe, and made France the first military nation of Europe. The reverses of the latter part of Louis XIV.'s reign were not of course without result upon the tone of the French army, and the campaigns of Marlborough and Eugene for a time diminished the repute in which the troops of Louis were held by other powers. Nevertheless the War of the Spanish Succession closed with French victories. The War of the Polish Succession in Germany and Italy reflected no discredit upon the French arms; and in 1740 the French army was still regarded as the first in Europe. Since the death of Louvois very little had changed. A royal regiment of artillery had come into existence, and the engineers were justly regarded as the most skilful in Europe. The total strength of the French in peace was somewhat less than 200,000, but relatively to the numbers maintained in other states, it was as powerful as before. But its officers were not the equals of their predecessors of the time of Turenne or Luxembourg. Louvois' principle of employing professional soldiers for command and wealthy men for colonelcies and captaincies answered fairly whilst continual wars gave the professional soldiers opportunities for distinction and advancement. But in a long peace the captains of eighteen and colonels of twenty-three blocked all promotion, and there was no work save that of routine to be done. Under these conditions the best soldiers sought service in other countries, the remainder lived only for pleasure, whilst the titular chiefs of regiments and companies rarely appeared on parade.

On the other hand, the fact that the French armies required large drafts of militia to bring up their regular forces to war strength gave them a vitality which was unusual in armies of the time. But in the wars of 1740-63, the superior leaders proved themselves incompetent, except for Marshal Saxe and some others of the younger generals, and defeats were the product of incompetency. The administration, too, was corrupt and inefficient.

Under Louis XVI. things improved somewhat; the American War and the successes of Lafayette and Rochambeau revived a more warlike spirit. Instruction was more carefully attended to, and attempts were made to reform the administration. Artillery and engineer schools had come into existence, and the intellectual activity of the best officers was remarkable (see Max Jähns, *Gesch. der Kriegswissenschaften*, vol. iii. *passim*). But the Revolution soon broke over France, and the history of the royal army was henceforward carried on by that revolutionary army, which, under a new flag, was destined to raise the military fame of France to its greatest height.

THE ADVENT OF CONSCRIPTION

If Louis was the creator of the royal army, Carnot was so of the revolutionary army. At the outbreak of the Revolution the royal army consisted of 224 infantry battalions, 7 regiments of artillery, and 62 regiments of cavalry, numbering about 173,000 in all, but capable of augmentation on war strength to 210,000. To this might be added about 60,000 militia (see Chuquet, *Première invasion prussienne*).

The first step of the Constituent Assembly was the abrogation of an edict of 1781 whereby men of non-noble birth had been denied commissioned rank (1790). Thus, when many of the officers emigrated along with their fellows of the *noblesse*, trained

non-commissioned officers, who would already have been officers save for this edict, were available to fill their places. The general scheme of reform (*see* CONSCRIPTION) was less satisfactory, but the formation of a National Guard, comprising in theory the whole military population, was a step of the highest importance. At this time the titles of regiments were abandoned in favour of numbers, and the costly and dangerous *Maison du Roi* abolished. But voluntary enlistment soon failed; the old corps, which kept up their discipline, were depleted, and the men went to the volunteers, where work was less exacting and promotion more rapid. The "first invasion" (July 1792) put an end to half-measures, and the country was declared "in danger," but after Valmy (*q.v.*), enthusiasm waned to such a degree that, of a paper strength of 800,000 men (December 1792), only 112,000 of the line and 290,000 volunteers were actually present. The disasters of the following spring once more called for extreme energy, and 300,000 national guards were sent to the line, a step which was followed by a compulsory *levée en masse*; one million men were thus assembled to deal with the manifold dangers of civil and foreign war. France was saved by mere numbers and the driving energy of the Terrorists, not by discipline and organization. The latter was chaotic, and almost every element of success was wanting to the tumultuary levies of the year 1793 save a ferocious energy born of liberty and the guillotine. But under the Terrorist régime the army became the rallying-point of the nation, and when Lazare Carnot (*q.v.*) became minister of war a better organization and discipline began to appear. The amalgamation of the old army and the volunteers, which had been commenced but imperfectly carried out, was effected on a different and more thorough principle. A permanent organization in divisions of all arms was introduced, and schools of instruction were re-established. The artillery and engineers, which in 1790 were admittedly the best in Europe and which, owing to the *roturier* element in their officer cadres, had not been disorganized by the emigration, steadily improved. The infantry, and in a less degree the cavalry, became good and trustworthy soldiers, and the glorious campaigns of 1794, 1795 and 1796, which were the direct result of Carnot's administration, bore witness to the potentialities of the essentially modern system. But, great as was the triumph of 1796-97, the exhaustion of years of continuous warfare had made itself felt: no sufficient means existed of replenishing them till in 1798 the *conscription* was introduced. From that time the whole male population of France was practically at her ruler's disposal; and Napoleon had full scope for his genius in organizing these masses. His principal improvements were effected in the interval between the peace of Amiens and the war with the third coalition, while threatening the invasion of England. The divisions had already given place to the army corps, and Napoleon completed the work of his predecessors. He withdrew the whole of the cavalry and a portion of the artillery from the divisions, and thus formed "corps troops" and cavalry and artillery reserves for the whole army. The grade of marshal of France was revived at Napoleon's coronation. At the same time, the operation of Jourdan's law, acquiesced in during times of national danger and even during peace, soon found opposition when the conscripts realized that long foreign wars were to be their lot. It was not the actual losses of the field armies, great as these undoubtedly were, which led Napoleon in the full tide of his career to adopt the fatal practice of "anticipating" the conscription, but the steady increase in the number of *réfractaires*, men who refused to come up for service. To hunt these men down, no less than forty thousand picked soldiers were engaged within the borders of France, and the actual French element in the armies of Napoleon grew less and less with every extension of the empire. Thus, in the Grand Army of 1809, about one-third of the corps of all arms were purely German, and in 1812 the army which invaded Russia, 467,000 strong, included 280,000 foreigners. As the later wars of the Empire closed one by one the foreign sources of recruiting, the conscription became more terrible and more difficult every year. Finally the capacity for resistance was exhausted, and the army, from the marshals downward, showed that it had had

enough.

One of the first acts of the Restoration was to abolish the conscription, but it had again to be resorted to within three years. A part only, according to the requirements of the service, were enrolled; the remainder were sent home on leave or furlough. Up to 1855 the individual drawn was obliged either to serve personally or find a substitute, but then the law of "dotation" or exemption by payment was passed, and put an end to personal substitution. The state now undertook to provide substitutes for all who paid a fixed sum, and did so by high bounties to volunteers or to soldiers for re-engaging. Thus gradually the conscription became rather subsidiary to voluntary enlistment, and in 1866, out of a total establishment of 400,000, only 120,000 were conscripts. Changes had also taken place in the constitution of the army. On the Restoration its numbers were reduced to 150,000, the old regiments broken up and recast, and a royal guard created in place of the old imperial one. Subsequent revolutionary changes of government were accompanied by increases in the army, while under Napoleon III. the imperial guard was re-created, and every effort made to revive the old Napoleonic traditions in the army. In 1859 the victories of Magenta and Solferino raised the reputation of the army to the highest pitch, and for a time made France the arbiter of Europe. But the campaign of 1866 suddenly made the world aware that a rival military power had arisen, which was prepared to dispute that supremacy.

In 1867, therefore, Marshal Niel (*q.v.*), the then war minister, brought forward a measure for the re-organization of the army. This was to have been a true "nation in arms" based on universal service, and Niel calculated upon producing a first-line army 800,000 strong—half with the colours, half in reserve—with a separate army of the second line. Niel himself died within a year, and 1870 witnessed the complete ruin of the French army. The law of 1868 remained therefore no more than an expression of principle.

At the outbreak of the Franco-German War (*q.v.*) the strength of the army on peace footing was 393,000 men; on war footing, 567,000. Disasters followed one another in rapid succession, and the bulk of this war-trained long-service army was captive in Germany within three months of the opening battle. But the spirit of the nation rose to the occasion as it had done in 1793. The next year's contingent of recruits was called out and hastily trained. Fourth battalions were formed from the depot cadres, and organized into *régiments de marche*. The *gardes mobiles* (Niel's creation) were mobilized, and by successive decrees and under various names nearly all the manhood of the country called to arms. Altogether the new formations amounted to nearly 1,700,000. Though, in the face of the now war-experienced Germans, their efforts failed, this cannot detract from the tribute due to the patriotism of the people and the creative energy of their leaders, of whom Gambetta and Freycinet were the chief. After the war the adoption of the "universal service" principle of active army, reserves and second-line troops, the essential feature of which was the *line* training of every man, was almost as a matter of course the basis of the re-organization, for the want of a trained reserve was the most obvious cause of the disasters of "the terrible year."

The most important of the recruiting laws passed subsequent to 1870 were those of 1872, 1889 and 1905, the last the "loi de deux ans" which embodied a special effort of the French Ministry of War to keep pace with the ever-growing numbers of the German empire. Not merely was the period of colour service reduced—to increase the strength of trained reserves—but exemptions were almost abolished except for physical unfitness.

But the growth of a school of military thought which placed little trust in reserve formations, led to arguments for a return to three-year system without its manifold wastage by exemptions.

(X.)

FRANCE IN THE WORLD WAR

In face of Germany's continual increases in the man-power and material strength of her armies, the French Parliament decided in 1913 to return to the Three-Year Act, the classes to be embodied

at the age of 20, so that the 1912 and 1913 classes could be called up simultaneously in October and November 1913. A special appropriation of 500 millions was also voted for military equipment. Unfortunately the full effect of these measures could not make itself felt until 1916. The three tables which follow illustrate: the growth of the effectives; the growth of the budgets; the military position of the two countries in 1914. They bring out clearly the considerable increase in Germany's armaments, and France's reluctance to join in a race in which, indeed, she remained always far behind. They also demonstrate the French army's inferiority in heavy artillery and special troops.

Growth of the Budgets of the French and German War Ministries Before the War

Year	France	Germany
1909	762,503,000 francs	1,015,119,000 francs
1913	1,287,615,000 " including 347,239,000 for extraordinary expenditure	1,903,005,000 " including 651,085,000 for extraordinary expenditure

Growth of French and German Effectives

Year	France		Germany	
	Officers	Other ranks	Officers	Other ranks
1875	23,326	361,590	21,488	382,180
1910	27,436	517,000	34,502	607,150
1913	27,756	532,000	36,600	721,780
1914	709,000*	..	870,000*

*These figures represent the maximum strength to be developed under the Army Acts of 1913.

Military Establishments of France and Germany on a Peace Footing in July 1914

France	Germany
163 infantry regiments 30 battalions light infantry 10 regiments Zouave rifles and Foreign Legion	217 infantry regiments 18 battalions light infantry 11 machine-gun detachments
79 cavalry regiments 10 regiments Spahis and "chasseurs d'Afrique"	15 fortress machine-gun detachments 110 cavalry regiments
62 regiments field artillery (655 batteries)	100 regiments field artillery (642 batteries)
11 regiments heavy or foot artillery (89 batteries)	25 regiments heavy or foot artillery (190 batteries)
6 regiments sappers and miners 1 railway regiment 1 telegraph battalion 1 balloon regiment 25 squadrons (of 5 or 6) aeroplanes	35 battalions pioneers 3 railway regiments 9 telegraph battalions 6 balloon regiments 5 aeroplane battalions 1 motor battalion

FRANCE'S EFFORT IN THE WORLD WAR

(A) Effectives and Munitions Placed at the Disposal of the Commander-in-Chief

	August 1914 before mobilisation	Sept. 1, 1915	July 1, 1916	January 1, 1918	Armistice
Effectives mobilised	947,000 men	4,200,000
Infantry divisions	44	III	109	113	112
Cavalry divisions	10	10	7	8*	8*
Field guns	2,800	3,250	4,400	5,900	6,400
Heavy guns	250	3,070	3,040	4,765	6,175
Machine-guns	5,106	24,475
Tanks	2,756
Aeroplanes	120	600	1,000	3,000	3,608
Motor transport vehicles (excluding trailers but including motorcycles)	8,500 (requisitioned)	25,000	32,000	49,000	56,000
Supplies of munitions in the army zone:					
Shells, 75 mm.	4,000,000	5,500,000	13,000,000	36,000,000	20,000,000
Shells, 155 mm.	500,000	500,000	800,000	4,000,000	4,000,000
Rifle cartridges	600,000,000	800,000,000	1,250,000,000	2,150,000,000	1,800,000,000

*Including two dismantled divisions.

(B) Munitions.

Total output during the war.

297 million shells of all calibres.
6,000 million rifle cartridges.
2,375,000 rifles and carbines.
225,000 automatic rifles.
87,000 machine-guns.
17,300 75-mm. guns.
6,722 heavy guns and howitzers.
5,300 tanks.
67,982 aeroplanes.
49,000 tons of asphyxiating gases.
34,000,000 gas-masks.

Number of munition-workers employed.

August 1st, 1914 25,000; Armistice, 1,493,800, including 429,000 women.

Daily Output of Certain Munitions

Scheduled output in mobilisation orders

14,000 75-mm. shells
465 155-mm. "
2,600,000 rifle cartridges

Maximum attained

226,000 75-mm. shells (1917)
51,780 155-mm. " (1918)
7,000,000 rifle cartridges (1917)

(C) *Railways.*—From the beginning to end of the war a heavy call was made on the French railways. The traffic was on an average 40% greater than in 1913, and at certain periods, in the uninvaded part of the North, 100% greater. At the outset, mobilisation movements demanded 10,000 trains, and subsequently covering and concentration movements called for 5,400. During the operations about 100,000 trains were run from point to point on the front, conveying 60 million men with the corresponding stores. Supplies of all kinds for the forces required an average of 200 trains a day. Additional to all this traffic was that due to the evacuation of the civilian population of the invaded regions, the supply of the civilian population, the provisioning of factories with raw materials, etc. Further, in the course of four years the railway engineer troops constructed a length of track (7,500 kilometres) equal to one-sixth of the entire French railway system.

(D) *Ports.* The following figures represent goods loaded and unloaded:—

1913, 42,300,000 tons; 1916, 56,673,000 tons; 1918, 53,550,000 tons.

At Rouen, where 5,148,000 tons were discharged in 1913, the figure for 1918 was 10,000,000. The import traffic of Le Havre rose from 2,747,000 tons in 1913 to 5,755,000 in 1918.

PRINCIPLES OF REORGANIZATION SINCE THE WAR

Post-war national defence in France has reached the final stage of its development. The essential legislation is, without neglecting the lessons of the war, to reduce the burden imposed on the country to a minimum. The war left France impoverished in manpower (1,700,000 killed and 600,000 disabled) and also economically and financially. But, deprived of the treaties of assistance contemplated in 1919, and not feeling that her late enemies shared her own pacific spirit, she was obliged to retain the ability to

provide for her security unaided.

Such were the principles, in some senses opposite, which underlay the reforms effected in the military organization. They led to the following conclusions: that in time of peace France should possess only such military and naval forces as were indispensable: (1) to cover the mobilisation of the nation in case of attack and enable it to be carried out fast enough to cope with the rapidity of such attack. (2) to provide for the security of her colonies and her communications with her oversea possessions in case of need. (3) to enforce the treaties of peace in concert with her allies; and that the general organisation of the nation for war should be prepared in every detail. In consequence, *compulsory personal service* was maintained, but the period was reduced to one year (Act of March 31, 1928). The 18-months' period of military service will be maintained until Nov. 1, 1930, when it is expected that the necessary conditions for the reduction of the period of service with the colours (recruiting of additional professional soldiers, military police and civilian employees; formation of a mobile National Guard) will have been fulfilled. The tables which follow show the effectives for January 1, 1928, as compared with those for August 1, 1914.

Comparative Peace Establishments on Aug. 1, 1914 and Jan. 1, 1928

Army		
	August 1, 1914, before the war	1928 (18-months' period of service)
Establishment (France and Colonies)	947,000	666,000
Infantry divisions	44	25
Cavalry divisions	10	5
Field guns	2,800	1,300
Heavy guns and howitzers	250	1,000
Air Force		
Number of aeroplanes	120	1,900
Navy		
Establishment	69,000	58,000
Battleships	26	9
Cruisers	31	11
Aeroplane-carriers	0	1
Destroyers	0	7
Torpedo-boats	83	47
Submarines	72	44

General Organisation of National Defence.—The last war taught the lesson that the nation as a whole must be organised for the eventuality of war, so that all may be in readiness beforehand for the entire strength of the country, civil and military, and the whole of its economic, industrial and other resources, to be thrown into the scale. A bill for the organisation of the nation to meet the contingency of war has accordingly been introduced by the Government, passed by the Chamber, and adopted with certain amendments by the Senate, and now only awaits its formal enactment by both Houses. The following are its main features:—

(a) *Functions of the Government.*—The Government is responsible for preparing the organisation of the country to meet the contingency of war. It will be assisted by the Supreme Council for National Defence, whose subordinate bodies (Commission of Enquiry and Permanent General Secretariat) are responsible for investigation and for co-ordination between Ministries.

The direction of the war will be in the hands of the Government, which will decide the ultimate objectives of the operations, distribute the forces among the different theatres of war, and supervise their employment; the actual conduct of operations, however, will be entrusted unconditionally to the commanders-in-chief of the army and navy. The Government will determine the duties of each Ministerial Department in time of war. Each Minister will be held responsible for the preparation and execution of the work of his department.

(b) *Decentralisation of Preparations.*—The preparations for organising the nation for war form too complicated a task to be car-

ried out by the unaided efforts of the Central Offices of the Ministries. The work has been decentralised and given to the local departments. The Prefect of each department is made responsible for co-ordinating the preparatory work to be done by all officials in his area. He is assisted by an advisory committee of the representatives of the various Ministries in the department, together with employers' and workers' delegates. Apart from persons liable for military service, all men over 18 years of age are bound to take a share in national defence proportionate to their physical and mental capacities.

(c) *Economic Organisation.*—A single Minister is responsible for the production and collection of a single commodity, and on mobilisation must be in a position to supply all the Ministries requiring that commodity. The supplying Ministries place orders with manufacturers for the commodities for which they are responsible. As one firm may manufacture goods required by several supplying Ministries, the economic allotment of output demands that a single branch should be entrusted with the negotiations with any particular firm, and should arrange the placing of orders. This co-ordination is effected by the Inspectorate General of Munitions on mobilisation, by means of machinery specially created for the purpose.

PRESENT ORGANISATION

The army, when mobilised, consists principally of the reserves called up. The standing army is only its nucleus, and its duties are to train the contingents called up, to guard the oversea possessions, to prepare for mobilisation, and, in the event of an attack, to cover the frontier until mobilisation is completed.

The Recruitment Act of March 31, 1928 provides for:—(i.) Men with the colours, comprising: (a) men called up for one year (all who have attained their 21st year); (b) half the contingent is called up on April 15 and the other half on Oct. 15. Volunteers (enlisted, re-enlisted, and officers) constituting the cadres of professional officers and N.C.O.'s required in peace and war. (ii.) Men on long furlough (*disponibilité*), which lasts for three years after the completion of service with the colours; these men may be called up in case of need. (iii.) A first reserve, also to be used on active service, in which the citizen serves 16 years; and a second reserve in which he serves for 8 years; this reserve is to be employed on home military service or in administrative and economic organising work.

The 635,000 rank and file (France, occupied areas, and colonies) at present forming the Army are made up as follows:—

Frenchmen (1½ contingents called up, and professional soldiers)	383,000
Foreigners (Foreign Legion)	16,500
North African native troops	103,500
Colonial native troops	87,500
Irregular and auxiliary native troops	12,500
Gendarmerie and National Guard	32,000
Total	635,000

Army Organisation.—The Act of March 28, 1928, dealing with the constitution of cadres and effectives provides for the distribution of the effectives among the various arms and services. When this Act comes into full operation (during 1928), the army will comprise 25 infantry and 5 cavalry divisions. The standing army is divided into three classes, embodying home and colonial troops. (a) Home forces, composed as a rule of French troops and stationed permanently in France. (b) Oversea forces, composed of Frenchmen, natives, and foreigners, detailed to occupy and defend French possessions, and stationed permanently there. (c) Mobile forces, reserves for the permanent oversea forces, consisting of French and native troops, and normally stationed in France and North Africa. The peace establishment (including officers) of these forces is approximately as follows:—

Home forces	365,000
Oversea forces	230,000
Mobile forces	70,000

Distribution of Troops.—The following table shows the proportions of the different arms at mobilisation in 1914, at the armistice, and at the present time.

BY COURTESY OF THE RANDOLPH COLLECTIONS

ROUEN, NORMANDY

From an etching, by John Taylor Arms, of a view in the city of Rouen, the mediaeval capital of the duchy of Normandy, now the chief town of the department of the Seine-Inférieure. The towers rising above the old houses in the foreground are those of the Gothic cathedral, which was started in 1201 and built during a period of four hundred years. The tower at the right surmounted by an octagonal lantern is the "Tour de Beurre," built in the 16th century, in the flamboyant style of the late Gothic. The lower Tour St.-Romain, in the centre of the etching, belongs to the earlier period. At the extreme left is seen the great central tower, with a modern spire. As the plate is reversed, the position of the various objects shown is the opposite of their actual one

(1) Arm or service	(2) Aug. 1, 1914	(3) No- vem- ber 1918	(4) 1928	(5) variation 1914-18		(6) variation 1914-28	
				-	+	-	+
	%	%	%	%	%	%	%
Infantry (home and Colonial)	65.6	43.7	55.2	21.9
Tank corps	..	0.6	9.6	10.4	..
Cavalry	9	3.5	7.8	5.5	..	1.2	..
Artillery	16.1	27.4	16.5	..	11.3	..	0.4
Engineers	3	8.0	4.4	..	5.0	..	1.4
Air force	0.3	3.3	5.4	..	3.0	..	5.1
A.S.C. transport (horse and motor)	1.3	7.7	2.6	..	6.4	..	1.3
A.G. and Q.M. G.'s department, etc., army medical corps	2.3	5.2	3.1	..	2.9	..	0.8
Gendarmerie	3.4	0.6	5.0	1.8	2.6

This table illustrates the development of the primarily mechanised arms (tank corps, artillery) at the expense of the non-mechanised arms (cavalry). The movement would be still more accentuated but for the necessity of increasing the normal rate of embodiment in certain arms requiring young men (cavalry, air force) because their peace establishment has to be kept at a figure approaching their war strength.

ARMY TRAINING

Officers.—The system of military training embraces both officers on the active list and officers of the reserve.

The military training of officers on the active list is based on the following principles:—Military training should be founded on a wide general education with a strong scientific bias, and on a specialized technical education for each arm. The officer's military education should be perfected during his service by keeping him abreast of developments in military manoeuvre, tactics and technique. Advanced training should be provided for staff officers and those who are fit for promotion to field rank.

Primary military training is given at the officer cadet schools (Saint-Cyr, the Polytechnique, and the Army Medical Service School), to which admission is obtained by competitive examination open to young men not yet liable for military service; and at the officer cadet schools for N.C.O.'s (St.-Maixent, Saumur, Poitiers, Versailles), which are filled by competitive examination among professional non-commissioned officers. The general training is completed in detail for each arm at the appropriate special school.

Additional training is provided by sending officers at various stages of their career to the schools for special branches or to technical courses (practical musketry courses, school of liaison and signalling, etc.), and to the special schools for the different arms (promotion courses, general course for field officers, instructional tours for colonels and general officers).

Prospective staff officers receive advanced training at the Staff College. Training for high command is given at the advanced military training centre and at the artillery tactical training centre.

Officers of the reserve receive, as far as possible, the same military training as officers on the active list, and at the same schools (St.-Cyr, St.-Maixent, Saumur, Poitiers, Versailles, Vincennes). The courses, however, are shorter. On embodiment, prospective reserve officers first perform six months' service with the colours; they then (after competitive examination) attend the reserve officer cadet schools, and, if they pass the final examination, perform their last month of service as second lieutenants of reserve. Students in important educational establishments (faculties, institutes, technical schools, etc.) take preliminary military courses there; then, after examination, they pass direct into the reserve officer cadet schools, and perform their last six months of service as officers. Reserve officers receive additional military instruction during their training periods, and at refresher courses when not on service.

N.C.O.'s and Men.—The N.C.O.'s comprise professional N.C.O.'s, and corporals and lance-corporals of the contingent. Both classes are trained in platoons organised for the purpose in the regiments, and receive additional instruction at training centres. The training of the rank and file begins with physical training before embodiment, continues throughout the period of service with the colours, and is resumed when they are called up for periods of training as reservists.

Tactical training of cadres and units begins as soon as individual instruction ends, and reaches its height in camp. Sufficient numbers are obtained with the help of the reservists who are called up at the same times. This training comprises separate exercises for each arm (the artillery, in particular, does its firing practice), and combined exercises.

THE MODERN THEORY OF WAR

A country's theory of war is not now, as it may once have been, a purely military concept. It is essentially a reflexion of the political principles that country pursues. Although forced by experience to maintain a certain attitude of mistrust, France regards herself as being better protected now than she was in 1914, thanks to the undertakings given at Versailles, to the Covenant of the League of Nations, and to the Locarno agreements. Following out this purely defensive theory, she has abandoned the idea of a powerful peace-time army, easily convertible into an attacking machine, and always supplied with all the weapons of offence necessary to the conduct of a war with large forces rapidly mobilised. Instead, she has unreservedly adopted the theory of the "nation in arms," taking the view that in the event of an attack the entire country should be responsible for its own defence, and that the peace-time army should only be expected to cover the frontiers while the nation prepares itself to defend its territory.

According to this theory of war, the French High Command is bound to take all necessary steps in advance to enable the peace-time army, though reduced to the minimum strength, to discharge its function of providing a screen if required. For this purpose the frontier fortifications need to be strengthened. Further, the High Command proposes to equip the regular army with every device that will increase the efficacy of its fire to the maximum (automatic weapons, observation and signalling arrangements, etc.). It is endeavouring to provide sufficient transport (railways, motor vehicles) to enable the reserves to be speedily conveyed to threatened points. It is also seeking to establish mechanised formations (major units, artillery reserves) and air forces which will be able to act with the minimum of delay.

The present military organisation of the French Army and its training are based strictly on these principles: (1) The period of service is reduced to the minimum compatible with the provision of adequate cover (18 months at present; one year from 1930, when the necessary conditions will be satisfied). (2) The regular army is to provide a screen and to serve as a training school for the reserve formations, which will make up the real war-time army. Moreover, a considerable portion of its establishment is employed outside France for the purpose of maintaining French authority, if necessary, in the oversea territories. (3) The reserve formations which make up the army must be strongly officered and thoroughly trained. These two requirements entail: (a) an increase in the number of professional N.C.O.'s, many of whom will form the nucleus of the subaltern cadres of the reserve units; (b) the training and periodical additional training of reserve officers, as already described; (c) the calling of reservists to the colours for short but frequent periods, such reservists to be detailed where possible to the units in which they served when in the first line, or to corps having some degree of connection with those units; (d) the training of reservists in camp, in contact with men serving with the colours, and under the direction of officers on the active list.

A policy has also been taken up with regard to arms and equipment: (a) new automatic weapons, representing an improvement on those used by the French infantry during the war, have been brought into service. (b) Owing to lack of funds, the other arms are for the most part keeping their old material, but are being increasingly mechanised. (c) The liaison and signalling arrange-

ments in use during the war are being daily improved to keep pace with scientific developments. (d) The Air Force is being exercised in close mutual communication between machines in flight and: Army headquarters, other arms, troops in the field, aircraft and Air Force headquarters on the ground. It is being exercised also in forming immediate temporary concentrations to act against important points without losing its readiness for every eventuality, and is thus becoming a first-rate covering arm and supplementing the action of the other arms.

Lastly, in order that those citizens who will form the mobilised army in time of war may be quickly furnished with arms, ammunition and other necessities not normally available, provision is already being made in peace-time for a detailed organisation to effect, when need arises, the industrial mobilisation of the nation—the more specifically military part of its organisation for the contingency of war. (B. S.E.)

NAVY

The geographical position of France has always compelled her to draw her navy from and maintain it in two widely different areas: the Channel and the Atlantic coast on the north and west, and the Mediterranean in the South. Originally the rule of the French Monarchy was only effective in the centre of the country, and before France could begin to acquire sea power it was necessary for her authority to be extended to the coasts. A beginning was made in this direction in 1180–1223, when Philip Augustus expelled King John of England from Normandy and Poitou. Although the process was not complete until Louis XII. (1498–1515), a Royal fleet was in being as early as 1249, when Louis IX. sailed on his first crusade. This monarch also established the first French dockyard at Aiguesmortes, while he also created the first admirals appointed by the French Crown, Ugo Lercari and Jacobo di Levante, both Genoese. Later Aiguesmortes was cut off from the sea by the encroachment of the land and Narbonne and Marseilles became the war ports.

The fleet of Louis IX. was purely Mediterranean in character. It consisted of galleys with secondary sail power, but mainly dependent on oars. The rowers of the French galleys were originally hired men, but by the middle of the 15th century they began to be composed of galley slaves—prisoners of war, slaves purchased in Africa, criminals or vagabonds serving their sentences. Under Philip IV., le Bel (1285–1314), efforts were made to constitute a naval force in the Channel in rivalry to Edward I. of England. As before, the Genoese were called in to assist and build a dockyard at Rouen.

The fortunes of the French navy have been wont to suffer from alternations of attention and neglect. Francis I. (1515–1547) made vigorous efforts to revive it at the very close of his reign but it languished again until the 17th century. Richelieu, the great minister of Louis XIII. found the navy extinct. He was reduced to seeking the help of English ships against the Huguenots, but from him dates the creation of a better fleet. In 1626 he abolished the office of Admiral of France, created by Louis IX., and himself assumed the title of Grand Maître et Surintendant de la Navigation, while seagoing commands were entrusted to two Admirals, one assigned to the west or Atlantic and Channel, the other to the Mediterranean. Richelieu's establishment shrivelled after his death and was recreated by Louis XIV. (1643–1714). A code of laws was then framed bringing in compulsory service, affecting the inhabitants of the coast and of river valleys, and at the same time a system was organised for the control of finances and of the dockyards of Toulon, Brest and Rochefort, while the office of Admiral of France was recreated.

As the result of these efforts the organisation of the French Royal navy on paper appeared very complete, but in practice it was not efficient. The Admiral of France was Louis' natural son, the duc de Vermondois, while the fleet was officered by men who owed more to birth than to professional ability. The ships' companies were ill-paid, ill-fed and otherwise defrauded and the severity of the Inscription Maritime was most unpopular. Under Louis XVI. (1774–1792) when the Revolution broke out, the majority of the noble officers were massacred by the Jacobins or driven into exile. It was long before the Republic was able to

create an effective navy and to form a new body of educated officers, but France had no reason to be ashamed of the way her fleet fought at Trafalgar, in 1805; but that battle marked her end as a naval power capable of challenging Britain by sea and, with the introduction of steam and ironclads, she ceased to maintain a fleet which constituted a menace to her traditional enemy across the Channel. From time to time some temporary irritant, such as the Fashoda incident in 1897, called forth comparisons between the British and French fleets, while the development of the torpedo boat, to which France paid much attention in the 'seventies, was regarded by many people at the time as an attempt to neutralize the power of the British battlefleet, but the World War found the two navies united in a common cause.

Between 1908 and the World War, France exerted herself to improve her fleet. From 1905 to 1909 inclusive, Germany had spent an annual average of 377 million gold francs on her fleet, while France had spent only 318 millions. A more serious difference was that Germany had a modern fleet, of which more than one-fourth of the units were nearly new. France, on the other hand, had a fleet mainly consisting of vessels approaching obsolescence. This resulted in considerable annual expenditure in upkeep and less to spare for new construction. By 1909 the tonnage of the German fleet (689,000 tons) exceeded that of the French fleet (664,000 tons); and for an equal tonnage France could only meet Germany's new units with old, and in some cases obsolete, vessels.

In 1910, the latest battleships France possessed were the six ships of the "Voltaire" type, then nearing completion. These were similar to the British "Lord Nelson" (1906). The most modern battleships of the French Navy in commission were the two "Républiques" and four "Justices"—approximately equivalent to the British "Londons" (1902), the German "Braunschweigs" (1902), and the American "New Jerseys" (1904). Moreover, while Germany had increased the number and improved the type of her light cruisers, which constituted so strong a threat to communications, France had devoted most of her attention to the construction of armoured cruisers of from 12,000 to 14,000 tons. These were not strong enough to act as battle-cruisers, and not fast enough to outpace the light cruisers. Again, the French torpedo-boats, whether of 350 tons ("Pougnard" type) or of 450 ("Spahi" type), had no longer the speed, endurance and armament necessary for an equal contest with the big German torpedo-boats. During the next four years great efforts were made to improve the position, but Germany had too long a lead for the situation to be retrieved in the time.

Dreadnoughts were put on the stocks—four "Courbets" (23,000 tons; 12 305-mm. guns), which, however, were barely ready in 1914; three "Provences" (23,500 tons; 10 340-mm. guns) were launched in 1913, but could not be put into commission until long after the opening of hostilities. In 1914 other battleships were building or in contemplation, but they could not be completed or begun owing to war necessities. Bigger torpedo-boats (800 tons), very fast and well armed for that time, were also built. These vessels, of the "Bouclier" type, were to render valuable service in the war, which threw such heavy work on the lighter craft. There were far from enough of them to do what was needed. As regards submarines, France continued to construct and improve the "Laubeuf" type. Submarines of 800-ton were on the stocks in 1914; but it was then so difficult in France to obtain and install Diesel engines of sufficient power that these vessels could not be put into commission for some time, and after a number of trials they were ultimately equipped with steam power.

Simultaneously with this strengthening of the material side of the navy, training was improved and, most important of all, the French naval forces were redistributed, the main squadrons being concentrated in the Mediterranean.

During the World War.—The main theatres in which the French navy operated during the World War were the Mediterranean, the Channel and Straits of Dover and the north Atlantic. Even before 1914 France had concentrated her principal forces in the Mediterranean, to defend her most important communications—those with North Africa. By arrangement with her Allies, she kept them there. The French fleet took part in all the general

Allied efforts at sea—blockading the enemy, protecting sea-borne supplies, transporting the Serbian army, the Dardanelles and Salonika expeditions, etc. In the Mediterranean the French fleet co-operated with the Allied naval forces in safeguarding the routes through that sea. In the Straits of Dover France had at first no more than a screen, consisting of torpedo-boats, submarines and a few cruisers. Later, these forces were strengthened, and assisted the British forces in safeguarding Channel shipping and in supporting the left flank of the Allied armies (*see* BELGIAN COAST OPERATIONS).

In more distant seas, French craft helped to chase raiders and took part in certain of the colonial expeditions. The navy also furnished men to the army, notably the Brigade of Marines which, under Rear-Admiral Ronarc'h, distinguished itself at Dixmude. But the navy did not expand in numbers of big warships because industries which had before the war been associated with this work devoted themselves almost wholly to the needs of the army; this was the case both in private works and in the Government arsenals, which manufactured, among other material, bridges, artillery and munitions.

Losses of the French navy during the war were:

Personnel: 15,650 killed and missing, including 519 officers.			
Fleet proper:			
Units destroyed by enemy action:	4 battleships	} 32	
	5 cruisers		
	13 torpedo-boats		
	10 submarines	} 7	
Units lost accidentally:	5 torpedo-boats		
	2 submarines		
Units put out of commission by wear and tear:	15 battleships	} 136	
	15 cruisers		
	42 torpedo-boats		
	64 submarines		
Total . . .		175	
Auxiliary fleet: 127 units in all.			

Gains (fleet proper):

Vessels commissioned:			
Built in France:	3 battleships	} 35	
	7 torpedo-boats		
	25 submarines		
Bought from Japan:	12 torpedo-boats	} 39	
Ex-enemy:	4 cruisers		
	2 destroyers		
	9 torpedo-boats		
	12 submarines		
Total . . .		74	

The net decrease was: 16 battleships, 16 cruisers, 30 torpedo-boats and destroyers, and 39 submarines. Total tonnage in 1914 was 816,000 tons (37% of the tonnage of the British fleet; 93% of that of the United States fleet), while in 1919 it was 590,000 tons (23% of the tonnage of the British fleet; 57% of that of the United States fleet). This shows a considerable weakening, still more serious in view of the wornout condition of all ships remaining in commission, a situation which was especially serious in the smaller craft.

Present Situation.—Up to 1921 the French navy was engaged in making up its war losses, but the reconstitution of the fleet was delayed by the impossibility of further increasing expenditure and the high cost of upkeep of too many wornout or obsolete ships; its tonnage, therefore, continued to decrease (to 394,000 tons in 1924). Eventually France agreed at Washington in 1922 to the proposed reductions, limiting her total capital-ship tonnage to 175,000 tons. As a great Colonial power, however, France is bound to keep up a fleet equal to her needs. For this reason, profiting by the lessons of the war and paying due heed to the Washington Treaties and her own financial difficulties, she made preparations to reconstruct her naval forces at the minimum practicable strength. The building of capital ships was deferred. To protect the country's vital communications, especially in the Mediter-

anean, the Ministry of Marine decided to rely chiefly on submarines, aeroplanes and light craft, with fortified bases. A reorganization of coast defence was undertaken, and the naval air force was developed along new lines. Light craft and submarines were placed on the stocks: between 1922 and 1928, eight cruisers, three of 8,000 tons and five of 10,000 (now in commission [1928]: the three "Duguay-Trouins," of 8,000 tons, and two "Duquesnes," of 10,000 tons; undergoing trials: the "Suffren," 10,000 tons); 18 destroyers of from 2,400 to 2,890 tons (now in commission: six "Jaguars"; undergoing trials: three "Guepards"); 26 torpedo-boats of from 1,400 to 1,500 tons (18 at present in commission and four undergoing trials); 51 submarines, including 20 of 600 tons ("Ondine" type), four "Saphir" minelayers of 760 tons, nine of 1,150 tons ("Requin" type), 17 of 1,500 tons ("Redoutable" type), one "Surcouf" of 3,250 tons (now in commission: nine "Requins" and 12 "Ondines"; undergoing trials: two "Saphirs" and four "Redoutables").

The future of the French navy is embodied in three bills, determining the naval position of France. The high-sea fleet is to comprise, apart from special craft, 175,000 tons in capital ships and 60,000 tons in aircraft-carriers, in accordance with the Washington treaties, together with 360,000 tons in light craft (cruisers, destroyers and torpedo-boats) and 96,000 tons in submarines. Age-limits are as follows: capital ships and aircraft-carriers, 20 years; cruisers, 17 years; destroyers, 15 years; submarines, 12 years. The naval air force will consist of 50 squadrons of aeroplanes (35 armed), and a variable number of miscellaneous aircraft (dirigibles, captive balloons, etc.). The coast will be defended by coastal flotillas (submarines, patrol-boats, minesweepers, minelayers, etc.), artillery, obstructions, detection systems, air forces, and by troops and material lent to the navy by the War Department. Although these bills have not yet (1928) been passed and no time-limit has been fixed for the execution of the programme they represent, the Department of Marine hopes to complete it in about ten years.

Administration and Personnel.—The French Navy is administered by a ministry of Marine which consists of (a) a navy cabinet and the minister's private staff, (b) a civil cabinet with civil secretariat. There is a naval staff which deals with organisation, intelligence and operations, and has also a section devoted to ports and bases, transports, supplies and communications. There is a central department of naval aeronautics, a hydrographic department, historical department, central headquarters of naval intendants, stores, medical, construction and naval artillery departments. Ships' companies of the French fleet are mainly composed of conscripts who are undergoing their eighteen months of military service, but the higher ratings are employed on a long service basis. Officers are recruited from the naval cadet officers' school and the polytechnic school. Naval engineer officers pass through an engineer cadet officers' school or are recruited direct from warrant officers of the engine room branch. There is a naval construction corps and a mates' corps, the latter recruited from chief warrant and warrant officers of the fleet. Most of the personnel of the French navy comes from Brittany, which is the traditional naval province of France.

Command.—The Chief of the naval general staff takes command of the whole naval forces and generally directs operations in war, while the central administration (ministry of Marine) ensures the working of the technical branches so as to give the command the necessary facilities for acting. Two Vice-admirals act as inspectors-general of the naval forces in the north and in the Mediterranean respectively; in war they become commanders-in-chief of the forces, but they may operate ashore and do not replace the existing commands afloat. The coast is divided into six naval arrondissements, each having its headquarters at one of the principal naval ports, with a chief known as the *prefet maritime*, who is the commander-in-chief of all naval formations allocated to his region. Under him are the commandants of sectors, known as commandants de la Marine, who are the senior naval officers in the commercial ports. (E. A.)

AIR

The military air arm, which came into being at the end of 1909, was organised on a proper legal basis in 1912, when a Directorate of Military Aviation was established in the Ministry of War and a few scouting squadrons were formed, which took part in the general manoeuvres. There were also some balloon companies, with spherical balloons and dirigibles. In 1913, the Ministry of Marine established two naval seaplane centres.

The Air Arm in the War.—The war brought about a great development in the air arm. In four years 40,000 aeroplanes and 92,000 engines were built, and 17,000 pilots trained. The development during this period is illustrated by the following figures:—

	August 1, 1914		November 1918	
	Army	Navy	Army	Navy
<i>Aeroplane branch</i>				
Number of squadrons . . .	23	0	130	4
Number of aeroplanes . . .	120	8	3,430	1,264
<i>Balloon branch</i>				
Captive balloons . . .	12	0	77	190
Dirigibles . . .	8	0	0	37

Commercial Aviation.—The Directorate General of Aviation (Commercial) organises and supervises civil aviation; it is also responsible for research, for the manufacture and collection of all air equipment, and for the preparations for industrial mobilisation. It controls the Air technical and industrial service, the Air navigation service and the National meteorological office. The French air lines are operated by five air transport companies, with a fleet of 250 aircraft, which link Paris with the principal European capitals, North Africa, Syria and South America, the total length of the system being 24,000 km. In 1927 their machines covered 6,000,000 km., and carried 16,000 passengers, 800 tons of goods and 125 tons of mails.

Military Air Arm.—The military air arm was organised as a separate arm by the Act of Dec. 8, 1922. It consists of two branches, the aeroplane branch and the balloon branch. The anti-aircraft regiments are attached to it for duty, but are officially subordinate to the artillery command. The Air directorate in the Ministry of War is responsible for the organisation, training and mobilisation of the Air arm. The Inspector General of the Air Arm reports to the Vice-President of the Supreme War Council on its general position, its needs, and the improvements in contemplation; he ensures uniformity in the application of the Air Arm regulations; and he is president of the Commission which decides what material is to be acquired.

The basic flying formation is the squadron. Squadrons are of three types: scouting, fighting and bombing. Several squadrons together form a group, and several groups a regiment. Several regiments, in combination with balloon units, make up a brigade. Taken together, several brigades constitute an "air division." There are at present 2 air divisions, 7 brigades, 14 air regiments and 5 independent groups, making a total of 133 squadrons and about 1,600 aeroplanes. The balloon branch consists of 18 companies, forming 6 battalions. Each company handles one balloon, and has an establishment of 2 officers and 100 men.

Naval Air Arm.—The central air service in the Ministry of Marine is responsible for the organisation, training and mobilisation of the naval air arm. The air strength of the navy comprises aeroplanes, dirigibles and captive balloons. The flying unit is the squadron, which consists of 10 or 15 aircraft according to the branch. Several squadrons form a group, and several groups a flotilla. The balloon unit is the dirigible; these are of two types, escorts (about 10,000 cu.m.) and scouts (3,000 cu.m.). The Naval Air Arm at present consists of 18 squadrons.

Colonial Air Arm.—The Colonial Air Arm was organised in 1920. It is purely military, but performs political, economic and medical duties. It comprises The Central Colonial Air Service of the Ministry of the Colonies (the controlling authority), the Indo-Chinese air force (4 squadrons of 10 aeroplanes each), and the French West African air force (one squadron).

The Air Ministry.—By two decrees of Sept. 14 and Oct. 13, 1928, a new organisation was created. Commercial aviation, as well as the military, naval and colonial air-arms become dependancies of a new Air Ministry; but the Minister of Navy keeps under his authority the staff of the air-squadrons carried on board men-of-war.

The three Ministries of War, Navy and Colonies receive from the Air Ministry, all the air-formations necessary for practical uses—co-operation with troops in the field or mutual instruction with other arms.

This reform creates great changes in the former organisation of the Air Arm, and in its connections with the army and navy, but details were not yet settled at the end of 1928.

Conclusions.—France spent on defence in 1928 31% less than in 1914. Her national defence budget—which includes certain items that appear, in many countries, in other budgets than those of the Ministries of War and Marine—represented 44% of the entire budget in 1914, whereas in 1928 it amounts to only 21%. Thus France's military expenditure has been reduced to the lowest practicable level, while her defence has been so organised that all her resources could be utilised if an attack should have to be met. Her dearest wish is to be able to diminish her armaments still further, and with that object she has made every effort to base her security on the enforcement of the Covenant of the League of Nations, the progress of arbitration and the spread of the conception of international solidarity. (B. SE.)

ECONOMIC AND SOCIAL CONDITIONS

Natural Resources.—France, which has an area of 212,700 sq.m., possesses great natural resources of wealth in her soil, sub-soil, climate, watercourses, maritime and geographical situation. The qualities and varieties of her soil and climate, as well as her maritime position, enable the facile production of the bulk of the national requirements in foods and feeding-stuffs, so that in normal times the country tends towards self-sufficiency in this important respect. She is still well provided with woods and forests. Although her coal deposits are not of exceptional richness or variety, yet they are now supplying 70% of the national consumption. Iron ore, potash, bauxite, salt, pyrites, antimony, are available in full abundance, and certain quantities of zinc, lead, manganese, and gold are regularly mined. In building and kindred materials she is exceptionally rich. Her numerous watercourses provide not only means of internal communication and irrigation, but also electric light and power.

No mean assets are her geographical position and characteristics. Placed on the most frequented sea route between the New World and the wealthiest parts of the Old, and on the Mediterranean, she reaps therefrom great maritime, climatic, food, trade and general civilization benefits; and her land frontiers connect her with populous, highly developed and wealthy communities. The physical conformation of the country is favourable for internal communications: between the Bay of Biscay and the Mediterranean they run through the fertile and sunny plains of the Garonne and of Languedoc, between the Mediterranean and the North sea along the valleys of the Rhone, Saône and Seine, between Lyons and Brittany, along the Loire valley and across the plains of Touraine and Anjou. The central Plateau (*Massif central*) of the Auvergne, Limousin and Cevennes alone offers some obstacles. Although not endowed with many good natural harbours on the coast lines, yet she possesses natural sea and inland ports of great merit (Brest, Toulon, Bordeaux, Rouen), and has succeeded in substantially bettering natural provisions in the sea ports of Marseilles, Sète, Cherbourg, Dunkirk, La Rochelle-Pallice, St. Nazaire.

Population: The Alien Elements.—During the last century, France has not shown growth in population similar to that of the other nations of western Europe. From 1821 to the eve of the Franco-German war, population increased indeed from 30½ to 38 millions, but from the first census (1876) after that war to 1911, the increase was only from 36.90 to 39.60 millions. The 1921 census reflected the results of the World War, and of the recovery of Alsace-Lorraine: for, even with the contribution

of 1,709,000 Alsace-Lorrainers, the total population was inferior by nearly 400,000 to that of 1911. In 1926, however, an increase of 1½ millions was shown (census population 40,743,844). It was mainly the result of foreign immigration (which has been the outstanding phenomenon in the social life of France since 1922): the number of aliens grew from 1,530,024 to 2,498,230. Its percentages of the total population in 1901, 1911 and 1922 were, respectively, 2.6, 3.9 and 7.2. In the late summer of 1926, over 3 millions were in the country. The most numerous are: Italians, 800,000; Belgians, 500,000; Spaniards, 430,000; Poles, 350,000; Swiss, 140,000; Russians, 90,000; British, 80,000; Germans, 60,000; U.S.A., 48,000 and Czechoslovakians, 36,000. Apart from Europeans, a large number of North Africans (Algerians, etc.) have entered France as workers in recent years.

Italians preponderate in the east of the Rhône area from the Italian frontier to Narbonne, and up to Lyons (they are said to form one quarter of the population of Marseilles and of Nice), but in recent years they have been moving also towards the Atlantic into the declining population areas of the south-west (Toulouse, Montauban, Auch, Agen). Italians, of whom only about 30% go into agriculture, are numerous in building and railway construction east of a line from Amiens to Marseilles.

Spaniards, who have increased proportionately far more than the Italians or Belgians, their number having grown from 106,000 in 1911 to 430,000, are mainly found within a line drawn from Bordeaux to Sète on the Mediterranean. They are engaged principally in agricultural occupations, but are numerous in manual occupations in Bayonne, Bordeaux, Toulon and Perpignan (in this town in 1926 nearly a third of the population was Spanish). These great waves of immigration in 1922-26, which were due to the intense economic prosperity of the country, were systematically directed and controlled. State agreements were made with Poland, Italy, Czechoslovakia, Belgium and Luxembourg which provided free equality of treatment with French workers as regards wages, accidents insurance, disputes, education and other matters. Depots of the Ministry of Labour were established to direct the immigrants to their employment. The coal and ore mining and metal industries central organization introduced directly about 400,000 workers in 1921-26. In 1927 a reflux occurred, owing to the return to less feverish employment conditions, and the number of recorded departures of workers exceeded the arrivals (89,982 against 59,271). This new and conspicuous prominence of the alien, his numerical importance, his penetration into so many fields of industry and agriculture, as well as into commerce, is not likely to give rise to grave problems. The direction of immigration has been largely determined by propinquity (Spaniards into the south-west and Pyrenees region, Italians into the south-east, Belgians into the north and east), so that assimilation as regards the normal scheme of life is more readily realized by persons who are akin in general civilization. A stringent system of control is exercised: every alien must possess an identity card, and its withdrawal or non-renewal is equivalent to an indication that his presence is no longer desired; and every employer of foreign labour must notify the fact within 24 hours to the proper authority.

Certain Demographic Facts.—The percentage of females in the total population, which was 50.87 in 1911, was 52.46 in 1926 (in that year the numbers were 20,352,884 and 18,444,656, or an excess of over 1,900,000: in 1911, that excess was 683,000). The French birthrate is higher than those of certain other countries (e.g., in 1926, 1.88 per 100 born living in France, 1.78 in Great Britain, 1.75 in Sweden, 1.84 in Switzerland), but the death rate for under one year is much higher in France (in 1926, 9.7 against 7 in Great Britain). Many public and private inducements towards large families are provided, including exemption or reduction in taxation for families with over two children, extra taxation of childless married persons, unmarried or widowed persons, and the family and maternity allowances now universal in Government employment and widespread in industries.

The movement from the country-side continued: in 1926, the percentage of the population classed as rural dwellers (i.e., those living in communes of under 2,000 inhabitants) was 53.6.

Few towns showed increased population, save Marseilles (now the first after Paris, with 647,700), Nice and Clermond-Ferrand, the great tyre centre. It is noteworthy that a large number of the ports of the Atlantic and the Channel have nearly all declined (Bordeaux, Lorient, Nantes, Brest, Cherbourg, Caen, Havre, Rouen, Boulogne, Calais and Dunkirk).

Of the total native population of 38,797,500 in 1921, 21,720,600 were engaged in occupations, of whom 8,606,000 were females; of the total alien population of 1,532,000 in the same year, 910,700 persons, of whom 213,000 were females. The total occupied population (exclusive of Alsace-Lorraine) of 20,843,805 in 1921 was distributed as follows:—agriculture and forestry, 8,660,248; fisheries, 72,283; mining, 276,725; transforming industries, 5,909,182; transports and warehousing, 1,130,499; commerce and banking, 2,171,640; liberal professions, 567,555; domestic services, 823,307; civil and military services, 1,232,366.

Economic Characteristics of French Nation.—The composite racial origins of the French race, their immemorial contact with the Germanic, Roman and other Mediterranean and Near-Eastern civilizations before and after the Crusades, the political pre-eminence of the nation in later centuries, have no doubt left their imprint in the high level of intelligence, taste, artistic and creative power that characterize the present population. France remains in the economic domain the world's principal purveyor of fine quality or luxury goods, and of works of art, which by their constantly changing nature, fancifulness, taste, quality and finish attract the more fastidious and discriminating classes in most civilized countries. The primary notes of French production retain this individuality and inventiveness, despite certain oncoming and more pronounced industrialization. These qualities explain the vigour of the small industries in France—the host of Paris trades, jewellery, artificial flowers, toys, knick-knacks, distinctive creations in innumerable branches, as well as the specialization in so many textile and other industries that have been now organized on larger lines than formerly. The persistence of these traits also explains how France still contains a very large body of small masters, and of skilled workers formed by them, whose inherited intellectual and artistic curiosity is extremely keen. The general population has not been overwhelmed to the same extent as most western European nations by urbanization and industrialization. The bulk of this inspiration, however, tends to come from more southerly parts of France where vivacity, impressionism, and artistic feeling are more rife than in the north. The nation as a whole displays other important economic qualities such as adaptability, staying power, physical and moral, and a passion for hard work, which is equally conspicuous in the school, in the factory and in the field. In French agriculture that passion and staying power are, no doubt, strongly stimulated by the magic of property. These qualities are partly maintained by the fact that the French national economy has kept at least an even balance between the two great accepted divisions of activity—industry and agriculture. An exceptional economic role is played by the French woman. Although she works with head and hand in the workshop, office, home and kitchen and, unlike her Anglo-Saxon sister, also takes her full share in the field, the structure and scale of French industry and agriculture, their many-sidedness and their considerable co-existence, owing to the great degree of localization of industry in rural areas, prevent her being unduly affected by the influence of factory and urbanization.

AGRICULTURE

Predominance of Agriculture.—Although strong tendencies have been operative in the contrary direction, especially within the last forty years, the national economy of France retains a predominantly agricultural character. The action of the urbanizing tendencies is, however, strikingly illustrated by the returns of the successive censuses, in which the inhabitants are classified as rural or urban, according as they are dwellers in local units known as communes with a population of under or over 2,000 souls: from 75 in the middle of the 19th century this percentage of rural dwellers fell to 62.6, 55.8 and 50.9 in 1891, 1911 and 1926 respec-

tively. Had it not been for the supplementary "rural" population brought into the scale by the return of Alsace-Lorraine, the 1921 percentage would have been lower, the war losses having fallen with exceptional severity on the rural districts. As representing an occupational group, agriculture ranks first: in 1921, out of a total occupied population of 21,720,604, there were engaged in forestry and agriculture 8,951,099 persons, as compared with 7,846,234 and 2,313,710 then assigned to the industrial and commercial groups. In 1896, 1911, and 1921, respectively, 444, 442 and 416 per 1,000 of the occupied population were engaged in agriculture. The return of Alsace-Lorraine with its 1,700,000 inhabitants has little affected the agriculturally occupied quota in the total population, as about one-third of the occupied population of the regained provinces were agriculturally employed.

Outstanding Features.—Certain outstanding features of the agricultural industry in France appear to be constant. The vast majority of the landholders are owners and occupiers; the excess of owners or independently-working occupiers over wage-earners remains great (in 1911 and 1921 the former totalled 5,219,464 and 5,017,152, and the latter 3,297,766 and 2,834,127); the proportion of female owners or independent occupiers is very high (in 1911 and 1921, 2,346,529 and 2,476,023, compared with 2,872,935 and 2,541,129 male occupiers); and the proportion of females as regular agricultural labourers is noteworthy (1911 and 1921, 891,226 and 987,451, against 2,406,540 and 1,846,676 males).

These figures are also distinctly indicative of the effects of the war: despite the accession of 65,600 Alsace-Lorrainers of the independent holders' class, the total in that class is 200,000 less, and women are 150,000 more numerous; and despite the same accession and the immigration of many alien males for agricultural work, there is a still more remarkable decrease in the agricultural labour figures.

The very small scale undertaking persists, and the relatively few large-scale undertakings have in considerable proportion been split up since the war for various reasons (labour shortage, loss of male owners or heirs through war, relative lack of capital of larger owners and relative enrichment of medium owners, taxation). No comprehensive official figures exist on this subject more recent than those of 1892 which showed that 85% of the holdings occupying a total of 27% of the cultivated area were under 25 acres. Owing to the widespread occurrence of dismembered holdings, whose strips are scattered usually within the same commune, about 145 million such strips (*parcelles*) are said to exist.

A recent enquiry (1924), limited, however, to vinegrowers' holdings, confirms the extreme subdivision of the land: of 1,565,567 vinegrowers who declared their output, 409,297 had vineyards of less than $\frac{1}{4}$ hectare, 403,962 of under $\frac{1}{2}$ ha., and 275,800 of less than one ha., or about 70% with under one ha.; besides another 13% (200,228) with from one to under two hectares.

Food and Drink Production.—Of the total area of 54½ million ha., about 41% (26% in Great Britain) is devoted to crops, 20 to meadows and pastures (about 50% in Great Britain), 18 to forests, three to the vine, and two to market and other gardening. Far the most important single crop is that of wheat, explained by the unusually large consumption of wheaten bread by the French; once occupying 12% of the total area, wheat now (1928) covers about 10% (5.2 million hectares, or 1.4 million less than in 1913). Oats (3.5 million ha.), potatoes (1.5), rye (.80), barley (.75), sugar beet (.22), are other important crops. The area under vines has sunk to 1.40 million hectares: a century ago (1830) it was 2, and in 1871, 2.4, but in 1891, 1901 and 1913 the figures were 1.7, 1.6 and 1.5 million. Fruit and vegetable cultivation has made progress in area and in quality, and a profitable foreign trade in luxury goods with many countries is maintained.

The livestock has regained its pre-war strength as regards cattle (14.9 millions), but sheep, of which there were 33.2, 22.5, 20.2, and 16.1 millions in 1852, 1880, 1900 and 1913, numbered only 10.7 millions in 1928. Large importations from Algeria are being made. In dairy and poultry farm products (milk, butter, cheese, eggs, poultry), made with increasing success, especially in Normandy, Brittany, the Savoy and in Poitou, a large foreign

trade has developed, and a decrease in the imports of several items (eggs, poultry, game) is observable.

Capacity for Feeding the Nation.—French agriculture, which has long been strongly supported by State action in many directions, and which has made immense progress in its general and technical efficiency, provides the great bulk of the food requirements of the nation. In wheaten bread, the chief staple, the home production before the war, which averaged in the thirteen years 1901-13 about 89 million metric quintals (220 lb.), was within 4 or 5% of the home consumption; since 1914, as the result of the war damage in several leading wheat areas of the north, of lack of man power, of mediocre seasons, and of reduced area under wheat, annual output declined and averaged in the eight years 1921-1928 about 76 millions. The shortage was made good by increased imports (which averaged 213,000 tons in 1923-25, but sank to an average of 188,000 tons for the three years 1926-28), by higher percentages of bolting, and at times by official enforcement of from 6 to 10% substitution of rye, rice or manioc. As the yield per hectare is improving (the annual average yield per hectare rose from 10.69 metric quintals for 1871-80 to 13.57 quintals for 1901-10: in 1921 and 1925 it was over 16), better wheat soils and more fertilizers being used, France may be regarded as likely to be in normal times all but self-sufficient for her bread.

French soil produces practically the full home requirements, whether for man or beast, in other cereals, root crops and fruits (oats, barley, rye, maize, chicory, potatoes, vegetables, sugar beet, apples, grapes, plums, nuts, etc.). In milk, butter and cheese, France is, or should shortly be, practically self-sufficient: she is a large exporter of soft fine quality cheeses and of butter, especially to England, and imports the harder cheeses. Although meat consumption has much increased owing to habits acquired on war service, French flocks and herds should, within a few years, nearly meet the French demand. One noteworthy development of the depletion of livestock and of war events has been the virtual introduction of frozen or chilled meat (from 3,200 tons in 1913, the French imports for the 5 years 1923-27 averaged 106,000 tons) and the growth of the horsemeat trade (imports alone are tenfold those of 1913).

France, although the greatest wine producing country, has consistently imported quantities of wine many times greater than she exported (she imports ordinary wines mainly from Algeria, Spain, Greece and Tunis, largely for blending purposes, and exports, mainly to northern countries and Great Britain, finer grade wines); other alcoholic beverages, brandies, liqueurs, beer, cider, are all produced from home raw materials in sufficient quantity, not only for national consumption but also for a considerable export trade. Of tobacco, the soil yields about half of the national requirements.

AGRICULTURE: COMMERCIAL ASPECTS

Industrial and Commercial Products.—French agriculture is fortunate in the cultivation of a number of important commodities for use after transformation or factory treatment: sugar beet, distillery beet, hops, oilseeds (e.g., rape, poppy, olive), flowers and herbs for perfumery (lavender, mimosa, orange, etc.) in the south and south-east, flax, hemp. Potatoes and fruits are also utilized for the production of much industrial alcohol. Among industrial or commercial products of French agriculture must also be noted the immense output of flowers, fruits, vegetables and plants and of the seeds thereof, for sowing, grafting, or embellishment purposes. The internal and external trade in cut flowers is great, as is that in seeds.

The official returns show that the area classified as specially devoted to fruit and floral horticulture has far more than doubled since 1913, having increased from 42 to 98,000 hectares: that to nurseries has likewise much increased (from 12,730 to 18,000 h.).

The yield of the woods and forests in commercial products must not be overlooked: for example, that of the pine forests of the Gironde and of the Landes and of Brittany, not only in pitprops, wood pavings and railway sleepers, but in turpentine and other extracts. In the category of textile raw materials, may here be

included that of the silkworm; the output of fresh cocoons and the number of growers have much diminished (in 1900, 1913, 1927, quantities of fresh cocoons were, respectively, 9,200, 4,400, and 3,600 tons, and growers numbered 136,000, 91,500 and 70,254). The production both of flax and hemp is less than half the prewar output.

Great Export Trade in Agricultural Products.—French agriculture has developed a great export trade in food and drink commodities: the total value of this trade in goods for human consumption (as distinct from animal feeding stuffs and other products) in 1926, 1927 and 1928 reached 5,079, 5,386 and approximately 6,750 million francs (880 millions in 1913). Great Britain provides far the largest market, and owing to the diversity of her demands in every season, her relations are of the most ramified and constant nature throughout the year with most agricultural regions (e.g., wines from Bordeaux, Burgundy, Champagne, Touraine; brandies from the Charente; flowers and plants from the Paris and Mediterranean areas, Angers, Orléans; seeds from Provence and Orléans; potatoes, cauliflowers, strawberries, apples, pears from Brittany and Normandy; eggs, butter, cheese, poultry, nuts, prunes, asparagus from a great part of France west and south-west, and south and south-east of Paris; early vegetables and fruits from Algeria, the Rhône valley, and the Mediterranean coast).

Advance in General Organisation and in Technical Efficiency.—Within the last generation, and notably since the war, French agriculture has made great progress both in organization and provision for the general purposes of the industry, and in technical efficiency.

County Agricultural Offices.—For the purposeful realization on a decentralized system of the definite national policy for the increase of home food production, there was created in each county under the law of Jan. 6, 1919, a county agricultural office (*Office départemental agricole*) with independent legal status, directed by five elected representatives of agricultural interests of the same county, and managed by trained agriculturists. Its functions include the permanent general guidance on practical lines of the agriculture of the county. The State restricts its action to the giving of technical advice through its inspectors of agriculture, and to the supervision of the proper employment of its grants. Under the public Order for the administration of the law, close collaboration with the agricultural co-operative and other associations within the area is postulated. These county offices are linked with a regional office (*Office régional agricole*), whose area corresponds to that of one of the eight agricultural regions into which France is divided: this regional office, on which the county offices are represented, has a general supervision of the county offices, and fixes the allocation of the State grants to the latter. This organization has proved efficient, and has much stimulated local progress in the theory and practice of agriculture.

Agricultural Banking System.—The development of the special institutions for financing the farmer has been marked. Before the law of Aug. 5, 1920, under which the National Agricultural Credit Fund was founded, no central independent banking institution existed for agriculture, the administration of the considerable funds obtained as foundation capital or as annuities from the Bank of France for agricultural credit purposes being administered by a branch of the Ministry of Agriculture under the rather rigid regulations governing all monetary transactions by State bodies. This fund, which was given legal personality and financial independence, so that it could follow in the main ordinary banking practice, received more extensive powers and scope than the previous State organ: inclusive of the sums placed at the disposal of the latter, it has been endowed since 1897 to the extent of about 700 million francs, composed mainly of the loan without interest of 40 millions in 1897 by the Bank of France and the annual payments for agricultural credit by that bank to the Treasury of a fixed percentage of its profit-yielding discount business. To this Fund are now affiliated 90 county agricultural banks, to which are attached 5,500 local banks with 295,000 members: moreover, 1,400 rural co-operative societies or other agricultural collectivities with 195,000 members, and 120 rural communes have obtained from it long-term loans either for building or purchase of

materials.

Rural Electrification.—Immense progress has been made since 1923 with the rural electrification which is so important as a means for the improvement, not only of the amenities but also of the actual work of the farm. Thanks to the active policy of the State, which has accorded at low rates of interest (4%) advances of funds not exceeding 50% of those raised for the purpose by the local authorities or agricultural collectivities concerned, and which makes grants on certain terms for approved rural schemes up to one-third of cost of their first establishment, about 7,000 communes have now been equipped through its support, and schemes covering about 12,000 more have been drawn up. In the five years 1923–27, total subventions of about 280 millions were sanctioned for 2,800 approved schemes, and by July, 1927, about 150 millions had been paid. In some French departments most villages or communes are already equipped (e.g., in the Isère, 97%; in the Rhône, 95%); and by 1938 it is expected that all of the 39,000 communes will be electrically equipped, as a consequence of the large thermic and water-power works already erected or to be erected in various parts of the country (e.g., the northern departments, Paris area, Brittany, Pyrenees, Auvergne, Savoy and South-East).

The co-operative movement has made great strides. The 5,500 credit societies had 320,600 members in 1927, and the agricultural trading associations (*Syndicats agricoles*) increased from 2,069 with 513,000 members to 9,100 with 1½ million grouped into 176 federations. Production co-operative societies number about 1,500 (principally dairies, cheese factories, wine depots, etc.). There are 7,000 cattle insurance societies with 340,000 members, 5,000 fire insurance societies with 194,000 members, and about 200 accident insurance societies with about 60,000 members.

Public Aid to Agriculture.—Space limits prevent the full description of the increasing part taken by the State in promoting agriculture. In education, higher and other, it is immense; the National Agronomic Institute at Paris for training of the highest kind in chief branches of agricultural science; 3 National Schools of Agriculture (Grignon, near Paris, Rennes and Montpellier); National School of Horticulture at Versailles; National Forestry School at Nancy; National Hippique School, 3 Veterinary Schools, High School for Agricultural Engineering at Paris; National School of Agricultural Industries at Douai; numerous technical schools for special branches such as dairying, sheep-keeping, rural industries, fruit growing; 30 provincial residential schools of agriculture; five farm schools; a dozen winter or season schools; itinerant winter schools and numerous post-school 4-year courses for primary scholars. The State or other public authorities maintain a large number of agricultural laboratories or research stations, which are under the direction of the State Agronomic Research Station (established in 1921).

It may be noted that the State as the owner of 1.15 million hectares of woods and forests, and the local authorities (communes) and other public entities as the owners of 1.94 million hectares of similar property, are the greatest agricultural landlords. The return of Alsace-Lorraine brought about 140,000 h. of woods and forests to the State, and 201,000 h. to other public bodies. The administration of the whole is entrusted to a special service with a certain military basis for the 32 forest districts. The total forest land covers about 10.34 million hectares.

NATIONAL EQUIPMENT FOR WEALTH PRODUCTION

National Economic Effort.—As one result of the far-dated political and economic unification of France, of the great military efforts in preceding centuries and notably in the Napoleonic period, the country has long possessed extensive national highways giving direct communication to chief points on the seaboard, on the various frontiers and between the principal towns. Her waterways were also developed at an early date. Much royal care was devoted to the ports in the days when French fleets and merchantmen were disputing with England the mastery of the seas, of India and of North America. In the 19th century, extensive main and subsidiary railway systems were gradually created, and with substantial State subsidies rivers and canals were

also improved. Ports, inland and maritime, were extended and equipped.

Probably never within such a brief period has so much been accomplished, however, in the way of improvements or renovation in the common utility services and by provision of the most various kind that forms part of the national economic equipment, as has been accomplished since 1914, and especially since 1919. The railway systems have been thoroughly overhauled as regards their permanent ways, rails, rolling stock and railway stations: two trunk systems have made great strides in the matter of electrification. Immense efforts and money have been expended on repairing and reconstructing the main highways throughout the country. Remote country districts have been provided with motor services in most cases with State or departmental subsidies, and are generally linked with railways. During and since the war manifold improvements have been made in the dock and warehousing capacity, in the machinery, motive power and in the general equipment of most French ports. Great achievements in this sphere have been the completion of the broad Rove tunnel, which gives Marseilles a large landlocked inner-harbour, the transformation and enlargement of the port of Strasbourg, the construction of a large fishing port near Lorient, and the building of large docks or other extensions at Havre, Rouen, La Pallice, Dunkirk and Marseilles. The canal system and its working equipment have been improved and extended, *e.g.*, the traffic capacity of the St. Quentin canal has been doubled, and the technical improvement of the water-courses, the modernization of inland ports, of haulage methods, and type of boats, has been noteworthy. The electrification of the country is now being pushed forward with such great energy that within ten years every French village and farm will no doubt possess electric light and power. The hydro-electric capacity of the country has been increased from 647,000 k.w. to 2,000,000 k.w., and the capacity of the thermic stations from 1,000,000 to 3,800,000.

Recovery of Alsace-Lorraine.—The return of the lost provinces not only added 5,600 sq.m. (2.5%) to the native territory and some 1,700,000 (4%) to the population, but it also doubled the ore capacity, conferred an immense benefit on French agriculture by bringing in valuable potash mines (output now 2½ million tons a year) and breaking the previous German world monopoly. It provided five to six million tons of coal and 70,000 tons of crude oil a year. It brought 1,900,000 cotton spindles, an increase of one-quarter, besides 40,000 looms, and more than doubled French cotton printing strength by its contribution of 160 machines, together with probably the most highly-developed skill in Europe in this branch. To the French woollen trade it added with its 400 wool combing machines about 20%, another 20% with its half-million worsted spindles, and about 12% with its 6,800 looms. Nor must the highly developed blast furnaces, steel and engineering works, chemical and food and drink industries of this area be forgotten.

Human and Mechanical Power.—In man power France, thanks mainly to the vast alien immigration movement (already noted) from Italy, Poland, Spain and Belgium, has more than recovered her pre-war position, the census of 1926 having shown an excess of 900,000 over that of 1911. Reinforcement of human and animal by mechanical power is proceeding at a greatly quickened pace in nearly all trades, notably in the mining, iron and steel, and machine and engineering industries; and that movement is particularly visible to the lay observer in the dwindling of animal traction and in the building trades group (house, tunnel, railway and harbour construction, road building and maintenance). The shortage of human power has led in agriculture to great development in the use of oil-driven motors, pumps and other small and large machinery, as well as of electrically driven labour-saving appliances and tools. The total electric power capacity in industrial establishments in fact doubled between 1919 and 1925 (from 2,465,000 to 5,022,500 kilowatts): that of railways and tramways increased from 9,886,000 to 16,525,000 k.w.

Manufacturing Capacity.—The remarkable advance in manufacturing resources has been due to two chief causes, apart from the return of the highly developed industry of Alsace-

Lorraine. The ten devastated departments contained over two-thirds of total coal capacity in the two departments of the Nord and Pas-de-Calais, a large percentage of the ore capacity in Lorraine, and great blast-furnace, steelworks, engineering, glass, chemical, and other undertakings; in the textile trades approximately 60 and 50% of the cotton spindles and looms, nearly all the wool-combing mills, about 80% of French woollen yarn and cloth capacity, 93 and 80% of linen yarn and weaving capacity. The reconstruction of all these devastated areas has been completed. New and larger scale factories or works have generally replaced those destroyed or badly damaged: the machinery, general equipment and layout correspond to the latest requirements of efficient production. In many trades the process has led to more economical output capacity: for war sufferers in the same industry often pooled their resources and replaced by more efficient units previous small undertakings. In the second place the enemy occupation of the greatest manufacturing area compelled the new installation or extension of works during the war in many other areas; and the needs of war likewise caused the erection of great engineering and other works with modern machinery for standardized production. The unbroken period of intense industrial prosperity from 1922 to 1928 permitted further great extension in means of production both in the former war area and throughout France. Some striking cases of industrial transformation may be noted. A large proportion of the northern coal mines were damaged or thoroughly wrecked: they have been entirely reconstructed.

Fresh Technical Knowledge and Foreign Undertakings.—Great accessions to the manufacturing capacity of France result from the acquisition of new technical processes and the immigration of foreign industrial undertakings. The French since 1914 have learned to make, or improved their knowledge of making, high-speed and special steels, dyes (about 600 synthetic dyestuffs covered by 1,000 patents), sulphate of ammonia by the Claude process; and they have acquired at various times manufacturing rights for the most varied engineering and electrical machinery and products from English, American, Swedish, Swiss, German, Norwegian and Italian owners. High customs tariffs and the depreciated franc have impelled the settlement of numerous foreign industries, especially from America, England, Switzerland and Sweden, including those of agricultural machinery, motor vehicles, railway brakes, central-heating plant, turbines, heavy and light electrical material, household and office furniture, safes, rubber and rubber goods, artificial silk, boots and shoes, biscuits, cakes, jams, etc.

Mechanical and Industrial Organisation and Direction.—The enlargement of factory units can be indicated only up to 1921: the 1921 census returns which concerned 77 departments, giving comparisons with the year 1906 for the groups of units occupying 201 to 500, 501 to 1,000, and over 1,000 persons, showed that there were respective increases of 50, 48 and 56% in the number of such establishments and of 49, 48 and 77% in the total number of persons therein employed. Since 1921 this tendency has gathered further impetus. The mechanical equipment of factories, especially in machine tools, has been much augmented. In many works has been introduced in recent years the chain or continuous-process system (*e.g.* in motor and cycle, electrical material, rubber, boot and shoe factories, woodworking and several engineering trades).

Direct control of the national production in a single branch by a single concern has not been often achieved (save perhaps in potash, aluminium, dyestuffs, shipping), but in many cases effective control has fallen into a few hands which may reach understanding as to conditions. Several French firms or group undertakings now own or have large participations in industries in several foreign countries, *e.g.*, one steel concern in Luxemburg, Czechoslovakia, Poland, Austria, Hungary, Roumania, Great Britain, South America, another in Italy, Luxemburg, Spain, Denmark; two or three motor concerns have works in two or three foreign countries.

Actual Results.—Complete demonstration of increased national capacity, output and power of the present France compared

with that of 1913 may not here be given in detail. It may be briefly noted, however, that hydro-electric and thermic capacity have both tripled in kilowatts, the merchant fleet is greater by 100 per cent, oil tankers are twelvefold more numerous, on the main systems railway trucks number 550,000 against 385,000, locomotives 20,300 against 14,300 (besides about 460 electric locomotives against 20), automobiles over one million against 100,000. In actual output some figures are telling: potash, 2½ million tons against nil, iron ore 43 million against 22, pig-iron 9½ million tons against nil, and steel 8½ against 4·7 million; coal 52½ against 40·8, metallurgical coke over 7 against 4 million. The annual output of automobiles grew from 55,000 in 1921 to 212,000 in 1927. The home industry of dyestuffs produces nearly 90% of home requirements and enjoys a large export trade: in 1913 the figure was under 10 per cent.; in light and pharmaceutical chemicals, in the electro-chemical trade it also produces nearly all home requirements.

The State as Employer.—The French State is a large employer of labour in production. In agriculture it owns and exploits about 2½ million acres of woods and forests. Two of the seven main railway systems, the State (5,700 miles) and the Alsace-Lorraine (1,350 miles) railways, are administered by it: the former employs 88,000 and the latter perhaps 30,000. The State tobacco monopoly employs 17,000 workers and 1,000 employees in its 21 factories in various towns.

COMMERCE

Commercial Policy and Recent Treaties.—French opinion is indissolubly wedded to protection. The powers acquired in 1916 by the executive to enact by decree, without reference to Parliament, import prohibitions and modifications of duties were extended till 1923, and were regranting in August 1926. In July 1919, to provide, in face of the depreciating tendencies of the franc, the same effective protection as was intended under the 1910 customs law, the system of coefficients or multiples of increase was applied to the specific duties (*i.e.*, to most duties, which are based on weight or material characteristic); these were raised on various subsequent occasions, and were stiffened in 1926 by two separate increases of 30 per cent.

The number of commodities subject to *ad valorem* duties has been much augmented. In the spring of 1927 was presented to Parliament, after nearly six years' preparation, a most comprehensive and far reaching measure of customs and tariff revision. By new and more detailed classification the tariff articles were increased threefold, and their sub-divisions were so multiplied that the total number of classes came to 6,000 or 7,000; and practically all rates thereunder were raised, many in substantial proportions. Parliament was not invited to discuss these rates, but gave special powers to the executive for the German and other international negotiations. The curious situation has now materialized that the great bulk of existing French tariffs have not been determined by the French Parliament directly but result from rates fixed by way of treaties with foreign countries. The effect of the 1927–1928 series of commercial agreements (with Germany, Switzerland, Belgium, Italy) and of additional customs legislation passed simultaneously with their ratification in a single legislative measure, has been substantially to raise almost the whole range of the minimum rates of duties and to increase *ad valorem* duties both as regards number and rates.

France indicated immediately after the war, by a year's formal notice of the denunciation of all her commercial treaties, her intended change of general policy, and by a law of 1919 she discarded the most-favoured-nation treatment for the reciprocity principle through the introduction of a third column of intermediate rates between maximum and minimum. It was also announced in 1927 that the minimum rates were not intangible. The reciprocity principle was applied in several treaties (Canada, Czechoslovakia, Austria, Italy, etc.). In the long negotiations (1924–27) with Germany, that country claimed and eventually obtained as from April 15, 1928, most-favoured-nation treatment. France accordingly now returns to that system, but not, however, without having previously negotiated a series of important treaties

in which, in exchange for advantages, the minimum rates were worked out for particular commodities with countries specially interested in these commodities (*e.g.*, for silks with Italy).

Changes in General Organization.—In France commercial enterprise for home and foreign trade has undergone transformations similar to those manifested in industrial enterprise, so that larger-scale organization and combination or concentration among distributors of goods and services, with the attendant consequences, are now its leading features. In banking, transport by land and sea, the selling of oils, chemicals, metallurgy, and engineering products, certain textiles, clothing, boots, gloves, foods, drinks, hotelkeeping, and other branches, the movement has taken pronounced form. Five or six banks with large capital, which have up to 60 offices in Paris and up to 1,300 in the provinces, and which tend to work on commonly arranged rules and rates, have gradually taken the place of hundreds of smaller banks or bankers. Three shipping companies control merchant shipping. The home and foreign chemical trade is controlled by three or four undertakings. The four or five great motor-car makers, besides having hundreds of agents as distributors at home and abroad, maintain numerous branches or garages, and in some cases have fleets of cars plying for hire in large towns. Great steel and electricity material firms have selling branches in the principal towns and in foreign countries. In many provincial towns and areas the multiple grocery shop is a prominent feature (*e.g.*, at Rheims, one with 850 branches, at St. Etienne, one with 600, at Lyons, one with 600, another with 300), but the meat trade is not generally strongly represented, and their importance is not equal to that of the multiple grocery and meat companies in Great Britain. More important than in Great Britain, however, is the departmental store. About one-quarter of the Paris retail trade in the range of goods sold at similar shops in London (but excluding groceries, meat, etc.) is asserted to be done at the dozen or so great stores of the capital. Manufacturers have to a considerable extent become also retailers: a goodly number of departmental stores have become manufacturers or acquired interests in appropriate factories. The co-operative distribution movement is far from having attained the same development as in Great Britain or Germany. The large local society with numerous grocery, meat and general goods branches, so familiar in the industrial centres of Great Britain, is scarcely known in France.

Magnitude of Visible Foreign Trade.—France ranks after Great Britain, Germany and the United States, as regards the value of visible foreign trade, the combined total of her imports and exports in 1926 and 1927 having reached respectively 119 and 108 milliards. In these two years visible exports represented 59·70 and 55·22 milliards; but it must always be recalled that invisible exports in the case of France make a most important addition to the credit side of the foreign trade account. In recent years unmistakable signs of progressive efficiency have been manifested. In 1919 and 1920, when the sterling rate averaged 32 and 51 francs, the debit balance of visible trade reached the enormous totals of 24,000 and 23,000 million francs: this was reduced to 2,500 millions in each year 1921–23, was converted into an average credit balance of 1,000 millions for the years 1924–26, and into one of 2,400 millions in 1927.

In brief general terms, France now purchases abroad mainly certain sources of energy (coal, coke, mineral oils), many raw materials (especially textiles, rubber, oil-seeds, timber, wood pulp, copper, zinc, tin, phosphates, nitrates), certain foods and drinks (wheat, tropical fruit, rice, wine, coffee, cocoa, tea), and sells abroad mainly manufactures (textiles, clothing articles, metal and engineering products, leathers and leather goods, chemicals, perfumery, paper) and agricultural products (wines, brandies, timber, skins, vegetable gums, beet sugar, fruits, vegetables, seeds).

Exports of food and drink products are superior in weight to the average weight of the years 1909–13. In weight, exports of manufactures show remarkable advance: the average annual weight of 2·16 million tons for 1909–13 became an average of 4·84 million tons for 1925–27. On the other hand, in weight the imports of manufactured goods have decreased (1913, 1·54, 1926

and 1927, 1.36 and 1.14 million tons). In the total value of exports of manufactured goods the textiles group occupies the leading place: in 1913 and 1924-27 it represented 37.9, 55.0, 45.7, 41.4 and 43.7 per cent. Developments in this group have been very striking, even after due allowance is made for the depreciation of the franc to about 20% gold; silk piece goods, which averaged 324 millions for 1909-13, reached 4,774 and 3,590 millions in 1926 and 1927; similarly woollens, 205, 2,500 and 2,168 millions; cottons, 353, 3,312 and 3,456 millions; under and outer clothing, 205, 2,886 and 2,138 millions; woollen yarns, 81, 1,041 and 1,732 millions; cotton yarns, 16, 315 and 739 millions. Similarly in other groups the value is multiplied: machines and machine-tools, 108, 1,900, 1,756 millions; small tools and metal goods, 110, 2,954 and 2,251; rubber, 73, 1,372 and 957; chemical products, 211, 1,169 and 1,523 millions.

The value in gold of the imports of most of these groups has considerably declined (e.g., woollens, 51 in 1913, 146 and 123 in 1926 and 1927; cottons, 56, 155, 86; silks, 49, 143, 100 millions). In the category of raw materials, notable advances have occurred as regards exports in the group pig-iron, iron and steel (87, 3,045 and 3,292 millions); potash (nil, 161 and 231 millions); resinous products (24, 375 and 258 millions). The recovery of Alsace-Lorraine has considerably affected several branches of exports (cottons, woollens, ore, engineering, potash).

Nature and Direction of Foreign Trade.—French export trade is distinguished by the exceptionally large proportion that belongs to the category of fine quality or so-called luxury goods. In the textiles group (in 1927, over 44% of total exports of manufactures) a predominant place is taken by silks, silk ribbons, silk and mixed under and outer clothing; laces, both cotton and mixed, and woollen dress goods: in other groups by jewellery, knick-knacks, fancy leather goods, perfumery, toys, games, pipes, motor cars, wines and brandies, choice and early fruits, flowers and vegetables, seeds and so forth. But whilst retaining primacy in the above classes, France is developing with a certain rapidity in many trades large-scale standardized production of ordinary goods of popular consumption, as well as of many heavy goods (e.g., metals, engineering products, heavy chemicals).

Her principal customers, as shown by percentages of total annual exports, are: U.K., about 18 to 20; Belgium-Luxembourg, 14 to 17; Germany, 12.7 before war, 7, 1922-26, nearly 12, 1927; Algeria, 7, United States, nearly 7, Switzerland, 6, Italy, 4, Spain, 3, Holland, 3.2, Argentine, 2%, Indo-China and Morocco, nearly 2, Tunis, 1.3, Brazil, Canada and French West Africa, about 1. Her principal suppliers in annual percentages, are: the U.K., 1909-13, 13, now about 12; U.S.A., 10, and now 13 to 14; Germany, 12, now about 8; Belgium, 7; Algeria, 4 to 5; Argentine, Holland and Italy, about 4, and Spain, 2.

Importance and Character of Anglo-French Trade.—France in 1913, 1926 and 1927 sold to Great Britain goods to the value of 1,454, 10,707 and 10,179 million francs, and bought there goods to the value of 895, 6,516 and 6,464 millions: the resultant balances of the visible exchanges to French credit were accordingly 559, 4,191 and 3,715 million francs. The yield of the invisible Anglo-French exchanges, were they statistically calculable, would show proportionately a far larger credit balance for France: for nothing on the English side of the Channel can match, to take the most important item, the expenditure in France of 700 to 800,000 British persons who yearly cross, thronging in the summer months Paris, the coast from Calais to Brest and round to La Baule, as well as the inland touristic and health resorts, and in the winter the Riviera or the Basque coasts. Great Britain in fact, as the buyer since time out of mind of one-fifth of French exports, is the vital and greatest French market, and so widespread and ramified are the origins of the exports that most industrial and agricultural regions are interested.

English exports to France, unlike those from France, which are goods into which much labour cost has entered, are mainly fuel, raw materials like wool, rubber, tin or factory equipment and textiles, of which a not inconsiderable element is made up of materials from other countries (e.g., wool, rubber). Coal is drawn mainly from south Wales and (less) from the north of England;

Australian or Argentine wool hides, raw rubber, tin, from London; textiles from Bradford and Manchester; boilers, machinery and machinery spare parts, mainly from Manchester and Birmingham areas, and Leeds; these together represent in value over 50% of British imports into France (if the milliard francs worth of pearls are excluded—France also exports to U.K. pearls to the value of 1½ milliard).

Invisible Export Trade.—France has suffered a serious curtailment in this respect, especially through the heavy decline in her holdings of foreign securities from war and post-war causes, but almost ample amends appear to be derived from the enhanced tourist industry and from more extensive French activities in foreign banking, insurance, industrial participations, shipping and other services.

Trade with Overseas Dependencies.—Steady expansion is notable in the trade of France with her overseas territories: its value and volume have greatly increased, although its percentage of the total foreign trade, owing to the still more increased transactions with non-French markets, fails to indicate the full measure of that development. The annual average percentage for 1909-13 of French colonial exports was 12.8 of the average total exports of 6,324 millions: that percentage for 1923-27 was 14.1 of average total exports of 46,451 millions. French imports from colonies averaged for 1909-13 11.1 per cent. of 7,627 millions: for 1923-27 that average was 10.6 for average total imports of 45,675 millions. The bulk of the traffic is with North Africa, notably with Algeria.

PUBLIC FINANCE

Position Before 1914.—In the twenty-five years (1889-1913) before the war, annual budget expenditure increased from 3,247 to 5,066 millions. The internal debt simultaneously increased from 28,328 to 31,452 millions, and the external debt from 915 to 1,534 millions. It may be observed that these figures relate to gold francs. In the seven or eight years preceding the war, it was recognized that the public finances required drastic overhauling, and that the old taxation system had proved inadequate. Despite easements by adjustments and loan in 1912 and 1913, the estimated deficit for 1914 was 800 millions; in that year indeed, a loan of 800 millions had to be issued in June under unfavourable circumstances, and the floating debt had become more serious. It was widely realized that new taxation resources were essential, but it was not until July 15, 1914, that the important principle of national income tax was established by statute. Thus at the outbreak of war in August the state of the public finances was not regarded as being from a technical standpoint entirely sound, although all were fully conscious of the bases of that great national financial strength that made France the banker if not of the world at least of continental Europe.

Financial Policy and Practice, 1914-19.—For the three years 1915-17 (the 1914 budget had been voted before war began), no regular budgets were presented to Parliament, which simply voted for the civil and military needs credits, whose distribution was determined later by decrees; in 1918 and 1919 were voted each year the series of two budgets, one for normal and one for extraordinary expenditure; the needs of the second to be met by loan. Although new direct and indirect taxation was introduced during the war (in 1916 income and war profits taxes were first applied, and raised in 1917 and 1918; in 1917, substantial increases in those on landed property and buildings; and new, or increased rates of old, indirect taxes on a whole series of commodities or services, e.g., the luxury tax, the early form of the now highly productive business turnover tax, those on tobacco, spirits, sugar, watches, stamp duties, postal rates, etc.), yet it was deemed that, since a very large proportion of the population (for two years practically all able males up to fifty years) was mobilized, and since the devastated regions, which formerly yielded about one-sixth of the total revenue, yielded little, any attempt by rigorous and comprehensive measures to cover the war costs was foredoomed to failure. The trained human agents of collection were also lacking: thus the income tax, inaugurated in 1916 by reduced and inexperienced staffs, produced extremely little (in 1916 and 1917, only 51 and 269 millions). For the six years

1914-19 (1919 may be included, as demobilization and return to normal conditions was gradual), the total revenue from taxation amounted to 36.24 milliards, and expenditure to 224.18 milliards, or approximately one-sixth was met out of revenue. The deficit was made good in various ways: by loans or advances by the Bank of France (about 12-14 milliards), by internal loans of various types, and by foreign loans. The current financial mainstay of the State was the national defence bond first issued in Sept. 1914 (the normal type became a treasury bill with 3, 6 and 12 months, afterwards 1 and 9 months' maturity, with interest payable in advance, but later issues carried 5, 6 and 10 years' maturities): at times after the war their total circulation approached 60 milliards. Several long-term internal loans, to a total of 28 milliards, were issued and numerous external loans were negotiated (England, America, Spain, Switzerland, South America, etc.).

Three Financial Reform Measures.—Early in 1920 the situation appeared most serious: for in 1919 expenditure had been 54.25 and revenue only 10.17 milliards, and the exchequer was faced with the necessity of providing for war damage reconstruction greater sums in 1920 and following years than the whole revenue of 1919 (in which year war damages payments reached nearly 15½ milliards). Decisive action was necessary to secure a reduction of borrowing and to approximate more closely income to expenditure. The proposals of the François-Marsal Finance Act of June, 1920, aimed at producing 8 more milliards of revenue by a general increase of taxation. The flaws of this reform were the retention of the second budget for extraordinary expenditure, which was to be entirely fed by loan, and the institution of a third budget of expenditure recoverable under the peace treaties (*i.e.*, from Germany), which also had to be fed by loans in France. The Finance Act of 1922 united the first two, but left the third as separate. The second reform, that by the Poincaré Government in March, 1924, after the Jan.-Feb. 1924 franc crisis, showed progress towards a sole State budget by the transfer of the permanent charges of the reparation budget to the State budget; it provided also out of revenue for six milliards so transferred, as well as for 4 additional milliards of revenue, and reduced the borrowing limit for the devastated areas to three milliards.

Another shock to public confidence in the summer of 1925 prompted the voting in July of a third reform measure in the 1925 budget, which for the first time since the war included all expenditure, and which provided for 6 milliards of additional revenue (although it still left to the exchequer the burden of providing a part of heavy war damages payments). It introduced a host of changes and of increases in rates of many important taxes.

Comprehensive Poincaré Reform of 1926.—The effect of these reforms was being continuously counteracted by the persistent depreciation of the franc, which, in view of brilliant economic conditions, appeared mainly due to the growing lack of public confidence on political grounds. The existence since May, 1924, of successive Governments which, although not containing members of the extreme parties yet represented a combination of advanced parties, relied on the support of extreme parties, and were believed to intend to apply some of their principles (*e.g.*, capital levy, compulsory exchange of 100-franc notes for new notes of 87.50 francs, increased nationalization of industry), caused a gradual decline in the purchase of Government securities or in renewals at maturity, so that the Government had to borrow more heavily from the Bank, and to increase the note circulation, to meet both current needs and the heavy maturities. Twenty-two milliards fell due in 1925 (though only 8 were claimed) and 6.4 milliards in 1926, apart from the regular maturity every month of about 7 milliards of National Defence Bonds. Under this influence the note circulation rose from 43 milliards in June, 1925, to 54 in June, 1926, and the loans from the Bank from 32 to nearly 36 milliards. The movement was accelerated by the lack of confidence that caused the non-repatriation of a great proportion of the yield of the great export trade, as well as the flight of capital from France. Within the year July, 1925-July, 1926, six Ministers of Finance and one Minister of the Budget left office without securing

the desired results. In July the situation of the exchequer grew critical, its coffers were almost empty, the American loan was practically exhausted, and the official exchange rate actually sank to 243 francs. Under the staggering influence of this fourth shock, a coalition government under Poincaré was formed with the full support of the nation, which at once took in hand its declared main function—that of the restoration of the national finances.

The principal aims were (1) to balance the budget, (2) to relieve the exchequer, (3) to reduce the floating debt and (4) to stabilize the currency. About 2½ milliards of new taxation revenue for the remaining 5 months of 1926 and 9.2 milliards for 1927, were voted on Aug. 5: of the latter 5.5 were to be obtained from indirect and 3.6 by direct taxation. Provision was made for the exchequer to meet its possibly heavy short-term liabilities through (a) budgetary receipts, (b) funds under the Dawes scheme (850 millions allotted in 1927), and (c) through the transfer to a special autonomous sinking fund, created under constitutional guarantee and given specific resources, of the service and redemption of national defence bonds and ordinary exchequer bonds. To this fund were assigned the total receipts of the tobacco monopoly, the yield of the new supertax on first transfer of buildings, stocks and goodwill, and of the succession duties (together estimated at 1,800 millions), as well as of other taxes. Its two-fold direction was confided to financial and technical experts (the latter skilled in the cultivation, manufacture and sale of tobacco). Its main positive function was to prepare the gradual reduction of the floating debt (then about 49 milliards principally made up of national defence bonds of under 12 months). As the stabilization of the currency depended principally on the general conditions resulting in the restoration of public confidence, on which would ensue the relief of the exchequer through the cessation of withdrawals, the renewal of subscriptions, the repatriation of capital, cessation of new advances from the Bank and new note issues, few positive measures to this end could be enacted, but the Bank of France was given special authority to purchase gold and foreign bills, and to issue in payment therefor notes not to be comprised in the official total of notes in circulation.

Wholesale Reform of Political, Judicial and Administrative Systems: Economic Equipment Programme.—For the needs of their financial reconstructive policy, the Government also acquired exceptional powers to legislate by simple decree subject to Parliamentary ratification within six months, and introduced within a brief period reforms almost on a Napoleonic scale into the political, judicial and administrative systems as ordered after the Revolution. In each capital of the 90 French departments, the executive has maintained since that period an agent entitled the prefect with official buildings as splendid as the town hall, and with staff running perhaps into hundreds, and in the chief departmental divisions a sub-prefect also with fine buildings and considerable staff, each official being advised by a prefectural or sub-prefectural council; and attached to each prefecture has been an official known as the general secretary. By a decree in September 1926, 106 out of 274 subprefectures with their staffs, all the 360 odd councils (23 councils from groups of departments were established in their place), and 70 out of 87 general secretaries' offices were suppressed. In the same month 228 out of 359 courts of first instance in the former sub-prefectural towns were suppressed, as were 396 posts of magistrates, 228 clerks of court and 218 local prisons. Two tax-collecting departments of the Ministry of Finance with separate offices throughout France were amalgamated, and 1,000 other offices of the same ministry abolished. Customs officials and postal servants were greatly reduced. The supply services of army and navy were amalgamated, two naval ports suppressed, army officers so reduced, that the 1914 figure of 35,200 will gradually sink to 28,000, a dozen cavalry regiments disbanded, 400 squads of gendarmes transferred into foot police. The Public Works Ministry, which has its engineers and employees throughout France in mines, railways, roads, ports, waterways, is compressing its departmental services into regional services. By a decree also, the Education Ministry undertook a large scheme of co-ordination and retrenchment. The great State departments occupied particularly with economic activities (Agri-

culture, Mercantile Marine, Public Works, Colonies) were required to draw up comprehensive schemes for the improvement of the national equipment or resources (e.g., for agriculture as a whole, for hydraulic power development, for full utilization of reparations in kind to provide national equipment of various categories, for colonial equipment and general expansion). The strength of France as an economic unit cannot fail to be fortified by this large-scale recasting and modernization of the public services. This enlightened legislation by decrees produced a profound moral effect and promoted public confidence.

Budget Expenditure and Revenue, 1913-1928.—The following is a view of annual expenditure under its main headings and of the total annual revenue from 1913 to 1928. The burden of reparations payments is obvious; and as these payments had to be made principally by loans, their reaction has been twofold by the concurrent addition to the debt charges account, which since 1924 has become the heaviest item of all.

State Expenditure and Revenue, 1913-28
(Million francs)

Year	Expenditure						Revenue
	Civil services	Military and naval services	Special accounts	Reparations (recoverable expenditure)	Services of the national debt	Total	
1913	1,904	1,807	6	..	1,355	5,072	5,091
1914	2,005	6,526	108	372	1,360	10,371	4,518
1915	2,479	14,712	1,197	1,194	1,818	21,400	4,113
1916	2,817	23,853	3,904	2,947	3,327	36,848	4,640
1917	4,119	28,662	2,983	4,081	4,816	44,661	5,811
1918	5,443	36,120	2,113	5,952	7,021	56,649	6,086
1919	9,297	18,185	3,387	15,481	7,903	54,253	10,176
1920	11,397	7,648	5,092	22,279	11,747	58,163	18,176
1921	9,938	6,312	2,714	21,423	11,636	52,023	21,217
1922	7,035	4,910	..	23,084	13,191	48,220	21,383
1923	5,896	6,540	..	16,455	12,810	41,701	23,495
1924	8,502	5,992	..	14,628	12,765	41,887	27,574
1925	8,980	6,207	..	3,643	19,264	38,094	32,957
1926	12,589	5,596	..	621	20,544	39,350	40,394
1927	11,893	7,823	..	1,980	21,081	42,677	43,297
1928†	13,122	8,482	22,150	43,754	45,570

*Separate revenue of the Autonomous Fund for Redemption of Debt (see text).

†Anticipated receipts and expenditure, according to Budget estimates.

NOTE: The postal, telegraph and telephone services form an independent administration with separate legal personality. Their receipts were 2,708 millions in 1927.

Principal Sources of Present Revenue.—Before the war, revenue was mainly derived from indirect taxation, but the introduction of the income tax and the development of other direct and allied taxes (e.g., that on dividends or securities) has considerably altered the proportion of direct and indirect taxation.

Introduced in 1916 (which year yielded only 51 millions), income tax showed receipts in 1927 of 9,693 millions, and those of the securities tax rose from 290 millions in 1919 to 3,385 millions in 1927; of other taxes on property, certain miscellaneous direct taxes produced in that year 903 millions, and those on registrations, stamp duties, property transfer super tax, death with succession duties, and duties on stock exchange operations respectively, 3,696, 1,898, 474, 1,942 and 347 millions. The three specifically direct taxes yielded therefore 13,981 millions and the second group, which is akin, 8,358 millions, or together 22,339 millions, or 44% of the State revenue. It may be noted in passing that the French income tax is levied in two guises both incident on the taxpayer: in the one form (as the *impôt cédulaire*) it is levied on the component parts classifiable as wages, salaries, business, industry, agriculture, professions, and at different rates according to the class or classes therein represented, and in the second form (as *impôt général*) at a single rate applicable to total assessed income after deduction of the other part of the tax payable. The most fruitful new tax

has been the business turnover tax, which is normally 2% on all transactions, and 12% on luxuries; instituted in 1920 in replacement of the luxury tax, it yielded in that year 942 and in 1927 no less than 8,605 millions, of which 924 millions were under the 12% luxury schedule. Other sources of indirect taxation in 1927 were: tobacco, 3,725 millions, the group *contributions indirectes* (taxes on wines, cider, beer, candles, railway and other transport freights and fares, cards, sugar, public vehicles, etc.), 2,994, customs, 2,617, alcohols, 1,878, sugars and saccharine, 999-9, mineral oils, 866 millions (plus 75-5 for heavy mineral oils and 26 for benzoles), automobiles, 620, colonial commodities, 406, matches and lighters, 242, and salts 217 millions.

National Debt, Internal and External.—The following statements from the 1928 Budget report of the Chamber of Deputies Finance Committee show the composition of the internal and external debts on Aug. 31, 1927:—

National Debt

Internal	Milliard francs	External	Milliard francs at 124.03 to £1
Perpetual and long term	178.70	Political	159.64
Long term (Autonomous Fund)	3.00	Commercial	18.24
Short term	29.22	Railways	1.95
Floating	59.37		
National Defence Bonds	44.38		
Advances of Bank of France	24.65		
Totals	294.94		179.83

The total debt amounted accordingly to 474.77 milliards, or 14 times that of 1913 (32.98 milliards of which internal was 31.45 and external 1.53 milliards). The internal debt had increased 8 milliards since July 31, 1926, but a certain reduction was subsequently effected by the repayment to the Bank of France of two milliards, and the external debt reduced by certain instalment payments to the two important creditors, Great Britain and America, by virtue of funding agreements not yet officially ratified. According to the Churchill-Caillaux agreement (July 12, 1926) the French debt to Great Britain was funded at 600 million pounds, and repayment fixed by varying annual instalments (1926-27, four millions, 1927-28, six, 1928-29, eight, 1929-30, ten, 1930-31 to 1956-57, 12½, and from 1957-58 to 1987-88, 14 millions): the first two have been paid. The agreed scale of repayments works out at 2% a year, being equivalent on the 5% basis to a flat annuity of rather less than 12 millions a year, and represents on this basis a present value of £227 millions, or a reduction of this debt by 62% or 65% of gross debt.

The other principal debt, to the United States, was funded in June 1925 at 4,025 million dollars, 30 million being payable in 1926 and 1927, 32½ in 1928 and 1929, and following years amounts increasing up to 120 in 1941, from 1942 to 1986, 125, and in 1987 117.67 millions. This scale is equivalent on a 5% basis to a flat annuity of 88 million dollars, and represents on this basis a present value of 1,681.4 million dollars, or a reduction of 58% of the debt. The war debts incurred to other countries (Holland, Spain, Switzerland, Argentina, Canada, Uruguay, etc.), which were relatively unimportant, have been repaid to a considerable extent. On the other side of the account, the debts of foreign States to France at the end of 1927 amounted to 8,542 million gold francs, of which, however, 7,839 millions are due by Russia. In March 1928 the Roumanian debt was funded at 525 million gold francs and the Greek at 178 million gold francs, both repayable in 62 annuities. The present value of the former is 185 millions and of the latter 103, on a 5% basis. The redemption of the internal debt is being pursued in various ways by the autonomous fund: that of the external debt has been much facilitated by the great reductions accorded by the two chief creditors, although the French thesis tends strongly to reject any settlement which involved a risk that at a given time France might have to meet calls from its allies

superior to its receipts from Germany. A large portion of the cash receipts under the Dawes plan is, together with other resources of the autonomous fund, to be devoted to this purpose.

Dawes Plan.—This scheme has worked satisfactorily in the 4 years (since Sept. 1, 1924) of its existence. Up to its inception France had received as reparations a total of 1,794 million gold marks under all heads (troops of occupation, deliveries in kind, cash, etc.), 8% in fact having been in cash: for the subsequent period, Sept. 1924 to Dec. 1927, she received 1,875 million marks, of which about one-third in cash. In the financial year 1928 France anticipated the receipt of 1,015 million gold marks (or about 6,090 million francs), of which the Treasury was to receive about 3,500 millions in liquid funds: but as 580 millions were to be absorbed by the upkeep of the Rhine army and about 1,250 millions by war damages compensation, only about 1,700 millions would have been theoretically available from this source for repayment of national debt.

Position in 1928.—The results of the Poincaré policy were good. The receipts for 1926 and 1927 were greater than for 1925 by 8½ and 18 milliards (including those of the autonomous fund), and balanced normal expenditure in 1926 and 1927. The exchequer has regained full independence, has reduced the debt to the Bank of France from 36½ to 31 milliards, and has acquired large reserves. Thanks to the work of the autonomous fund for debt reduction, greater security against the floating debt danger has been obtained by the gradual conversion of the whole body of national defence bonds (about 48 milliards) into two-year maturities (from those of 1, 3, 6, 9 and 12 months), besides the funding of another part thereof. Since Dec. 1926, *de facto* stabilization of the franc at approximately one-fifth gold value existed; and in June 1928 legal stabilization at 124.21 fr. to the £ sterling was introduced. For 1928, no new taxation of importance has been found necessary, perhaps even possible: for with the inclusion of the payments (8,014 millions) to the autonomous fund, the budget revenue amounts to 50,571 millions, compared with the revenue of 5,091 millions in 1913.

Currency.—Paper money has been legal currency since 1914. Gold disappeared from circulation early in the war and silver followed suit in 1921 being replaced by notes. The note circulation which was 5,655 millions in 1914, averaged 44,071 millions in 1925, and has ranged from 52,000 to 58,000 millions since mid-1926. The circulation in the early months of 1928 has been from 56 to over 58 milliards. The gold cover actually in France hovered for many years about the figure of 3,685 milliards, but was increased in 1927–1928 by the purchase of gold at home and abroad to about 3,700, plus 463 millions in gold or gold value at disposal abroad (abroad but not at free disposal are another 1.4 milliards). The notes, issued by the Bank of France, are of the denomination of 5, 10, 50, 100 and 1,000 francs. The coinage consists of 10 and 20 frs. (gold); 20 and 50 centimes, 1, 2 and 5 frs. (silver); 5, 10, 25 centimes (bronze-nickel); 5 and 10 centimes (bronze). In addition brass tokens, issued by the French Chambers of Commerce, for 50 centimes, 1 and 2 frs. are in general circulation.

Banking and Credit Organisation.—Joint stock banking, which was winning its way to predominance in France before the war, has established more firmly its position in conformity with the greater scale of general industry and trade. Four or five banks show 1,000 or 1,200 branches throughout France. The Bank of France plays a far larger part in current banking than does the Bank of England: in 1927 it showed 18 branches in the Paris area, elsewhere 159 branches, 83 sub-branches and 400 other offices. Leading industrial centres like Lille, Lyons, Nancy, Strasbourg, have strong local banks, but the private family banks, so numerous formerly in small and large towns, are rapidly disappearing.

France possesses two great institutions which are lacking in Great Britain: namely a central real property mortgage bank and a central agricultural credit organization. The Cr dit Foncier, created in 1852, administered under State supervision and accorded certain privileges, has headquarters in Paris with offices and agents in every centre of importance, makes mortgage loans and

bond issues on urban and rural property, and may be held to rank after the Bank of France as the second banking institution. The National Agricultural Credit Fund is affiliated with 90 county and 7,000 local organizations. Great Britain also has no counterpart to the flourishing postal cheque system established in 1918 which showed on July 1, 1928, accounts numbered 394,300.

COMMUNICATIONS AND TRANSPORT

Roads.—By the middle of the 19th century the national highways system totalled about 48,000 miles. Although the advent and general triumph of the railway spelt the doom of the former lively passenger and goods traffic by road, save for short distances, and stayed the pace of road developments, yet persistent advance as regards the main routes was made under the direction of the Bridges and Highways Department, which builds and maintains the roads classed as national roads (*routes nationales*). By 1927 the public roads mileage had increased to 384,930 miles, of which 25,400 (6.6%) were national roads. It may be noted that the latter normally measure from 18 to 20 metres in breadth, inclusive of the space occupied by the bordering trees and ditches, and that county roads are from 13 to 14 metres broad. France appears therefore to be admirably supplied with main and secondary roads, and little demand is observable for extensions. One great new road has recently been built—the Alps Road (*Route des Alpes*) which, roughly speaking, provides a highway from Grenoble to Nice.

Great improvement has been effected in the general state of the main roads, which underwent the severest wear and tear both within and without the war areas during the war years. The problem of maintenance has grown difficult, not only owing to the great road mileage in relation to population and the comparatively vast expanse of territory, but also because the roads also must bear now a far superior intensity, speed and weight of traffic: for within equal periods passenger cars can travel many times their former mileage, and goods transport vehicles have increased fifteenfold in number and carry heavier loads (the Minister of Public Works has, in fact, estimated the motor circulation on the roads to be thirty times greater than in 1914).

The public financial burden amounted in 1927 to nearly 2,500 millions, of which 614 millions under all forms were expended by the State on the national roads (Parliament voted 530 millions for 1928 as against 34 millions for 1913). The State however collected 1,197 millions in taxes and duties on petrol, and the automobile tax for 1928 was budgeted to provide the State with 538 millions and the local authorities with another 100 millions. The total cost to all public authorities is, however, elevenfold that of 1913.

Railways.—The railway mileage of France in 1927, including the 1,400 miles of Alsace-Lorraine, was approximately 26,300 miles, and new construction proceeds. Besides the seven main systems, the secondary lines show a total mileage of 6,200; they are subject to the law regulating the tramways (length 4,300 m.). It may be noted that there are approximately 150 public automobile services, State-authorized or State-supported, in some fifty departments, which employ 2,900 vehicles. Many of these are linked with railway services.

Two main systems are administered by the State: the Alsace-Lorraine and the State Railways. The latter (length, 5,700 m.) composed mainly of the lines of the former *Ouest* and of former minor concerns, connects Paris with Normandy (Havre, Rouen, Dieppe, Deauville, Caen, Cherbourg), Brittany (St. Malo, Rennes, Brest, Nantes), the west and south-west (La Rochelle, Saintes, Bordeaux); but its considerable territory is mainly agricultural and sparsely populated. The taking over by the Paris-Orl ans system (4,900 m., serving, beyond Orl ans, Tours-Poitiers-Bordeaux, Tours-Angers-Nantes-St. Nazaire, Vierzon-Limoges-Toulouse) of at least a part of the State system in territory into which it itself runs, as in south Brittany or in the area Nantes-Bordeaux, has been proposed, and certain areas have voted in favour thereof.

Under the far-reaching scheme of general reforms introduced by the Railways Law of Oct. 1921, the separate railways were

left independent as regards their internal administration, but there was instituted the Superior Railways Council, having representatives of the State, the companies, the workers and several other private and public interests, including users and ordinary consumers. Its principal functions consist in the supervision of the general working, the issue of guiding principles for the collaboration or better working of the units, as for example the establishment or alteration of common freight or passenger rates, the standardization of rolling stock types or line equipment, the conditions of service of railways workers. One important concrete foundation was the establishment of a common fund or pool, into which in principle is to be paid the excess of receipts over expenditure of the component companies, and from which is to be made good the deficit of any company. On the institution of this new system, the State relieved the companies of a total indebtedness of 13,020 million francs, having already made full provision for the reconstruction work of the three systems (Northern, Eastern and Alsace-Lorraine) which were situated in the war zones. In the six years 1921-27, when the common fund only received comparatively insignificant sums as excess over expenditure, but had to disburse between 4,000 and 5,000 millions, the necessary resources were obtained by advances from the Treasury which required the railways to issue debentures, but the payment of loan charges for loans issued in the six years was assured by the State. This new system has worked well. It provides a co-ordinating authority that has tended greatly to increase the general efficiency and more economical working of the railways; it has already expedited many technical reforms.

The electrification of French lines has made good progress; about 750 m. out of the after-war scheme of 5,600 m. have been electrified. The Southern (Midi), which had before the war electrified 142 m., has been the most active, and shows now a total of nearly 550 m.; and by 1930, by having electric traction over 650 m. out of the total 2,000 m. of that system destined to be so transformed, it reckons to dispense annually with 500,000 tons of coal. Energy is derived from four water-power stations in the western and three in the eastern Pyrenees. Of the 2,000 m. planned to be electrified on the Paris-Orléans system, about 150 have been completed.

The French Railways are more efficient and more comfortable than in 1913. In 1926 they carried 801 million passengers and 320 million tons of goods (against 525 and 193 million in 1913). The general direction has been centralized, with the results above enumerated. The mileage is greater: the permanent works and ways have been thoroughly repaired after the war damage; rails and sleepers have been entirely replaced over a great proportion of line. The rolling stock equipment is far larger (at present 20,760 locomotives and 590,000 trucks and carriages), its quality, interior fittings and conveniences are much improved, and sleeping-car and restaurant services have been developed. Apart from the new stations built in the devastated areas, new modern central stations have been built elsewhere (e.g., Rouen, Limoges, La Rochelle, Nice), new maritime stations are built or planned (e.g., Dunkirk, Cherbourg), and nearly all the Paris termini are being improved and greatly extended. The financial position has also shown improvement as a consequence of the repeated increases in rates: since 1918, they have been raised eight times, and in 1928 a further rise in freight rates has taken place. For the first time, the common fund showed a net surplus of 560 millions in 1926, of which 500 millions were allocated to repay to the State the amount payable by it in 1927 as charges on loans issued from 1921 to 1926 by the companies. In 1927 the total deficit was 822 millions, or 322 after deduction of the said 500 millions. In 1928 the deficit may be greater by the fact that the common fund has no resources to meet the annual loan charges of at least 500 millions: the deficit at first estimated by the railways at 1,650 millions is now put at 980 millions, although new wages increases alone will involve the outlay of 350 million francs. Receipts in 1926 and 1927 reached 13,373 and 13,377 million francs (2,022 millions in 1913), and ordinary expenditure 10,154 and 10,269 millions (1,276 millions in 1913), but the charges plus bonus on working, amounted to 2,640 and 2,693

millions (822 millions in 1913, exclusive of Alsace-Lorraine). These immense new annual charges have been due in large measure to directly or indirectly productive expenditure, e.g., on electrification (and new electric stock, locomotives, etc.), improvements in permanent way, new rolling stock, building of dwellings for employees, and so forth, but outlay has been swollen by the greatly increased costs, by the high rate of interest and by taxation. Ordinary expenditure has been much increased also by the effect of the eight-hour-day—the number of railway workers on the six main systems (i.e., excluding Alsace-Lorraine) rose from 356,000 in 1913 to approximately 479,000 in 1926. Wages and salaries have also risen (in 1928 the coefficient of increase is 5.8, 6.4 and 7 for married workers at Paris, with 1, 2 and 3 children, respectively, the minimum Paris rate, inclusive of 3,000 francs as rent allowance but exclusive of family allowances, being 9,450 francs, against 1,850 francs in 1913), and in 1926 represented 41% of the working expenses.

WATERWAYS, PORTS AND SHIPPINGS

Inland Waterways.—In the forty years before 1914, the kilometric tonnage of the French inland waterways had quadrupled; but the war wrought great damage, so that the traffic tonnage of 42 millions in 1913 had recovered by 1921 only to the extent of 19½ millions. Great advance has since been made (30.5, 37 and 39 million tons for 1922, 1925 and 1926, and for 1927, nearly 42 millions). Of the French rivers, which have a navigable length of 3,800 m., and carried 21, 19 and 20 million tons in 1913, 1925 and 1926 respectively, far the most important is the Seine, which is navigable for 350 m., has several navigable tributaries, and is connected with the north, east and south by various canals: merely over the 7 or 8 miles of its Paris stretch, it carries annually nine million tons. The Scarpe, a tributary of the Escaut on its right bank (after having traversed Arras and Douai) with a navigable course of 46 m., shows a great coal tonnage; others of importance are the Escaut (40 m.), the Rhine (56 m. navigable along French territory), the Marne (115 m.), the Lys (45 m.); of the long rivers, the Rhône is navigable for 300 m., the Saône for 230 m., and the Loire for 130 m., but for various reasons these are comparatively little used for goods traffic. The South-Western rivers, the Garonne (navigable length, 240 m.), the Dordogne (170 m.), the Adour (72 m.), are likewise hardly used beyond Bordeaux, Libourne, and Bayonne, respectively. French canals, which have a total length of about 3,300 m., carried in 1913, 1921, 1925 and 1926, respectively, 21, 9, 18 and 19.3 (in 1927, probably 21) million tons. The bulk of this traffic occurs in the area to the north and north-east of Paris, the goods mainly carried being fuel and building materials for the capital, and fuel, ores, building material and heavy agricultural products to various destinations within the same area, or to and from Belgium. There are about 550 inland navigation ports (224 on rivers, 325 on canals), of which 30 show an annual in and out traffic of more than 200,000 tons, Paris, Rouen, Strasbourg, with about six others on the Seine or in the north, showing over one million tons. Waterways connections are accordingly seen to exist between Paris, Belgium and Germany, and between Paris and the distant home areas of the Vosges, Lyons, the centre, and Burgundy, so that goods from Nancy, Strasbourg, Besançon, Lyons, Nevers, Dijon, and elsewhere, reach the capital and the sea by waterway.

State policy for generations has not ceased to promote the development of internal navigation, and within the last fifty years three national programmes (1879, 1903, 1921) have obtained legislative sanction, though not subsequent fulfilment in every particular. In 1912 was established the National Office for Internal Navigation, designed to exercise central control and guidance, to further in every way the technical development of internal navigation and (especially since 1920) to take an active part even in its equipment and management. The yearly State appropriation is fairly substantial: that in 1927 was 117 millions, of which 57 was for new constructions, 39 for maintenance, and 21 for repairs of war damage, and that in 1928, 125 millions (the German National Budget allotted for 1927-28 for new canal

building was elevenfold that amount with 110 million marks for construction, plus 36 millions for improvements).

Of the three greatest French modern waterway projects, the **Marseilles-Rhone canal**, the Rhone development scheme, and the **Grand Canal of Alsace**, only the first-named has made real headway. This canal has a minimum depth of 8.3 ft., and comprises two sections in its length of 51 miles. The second part, which was completed in 1926 after over 20 years' work, and at a cost of over 200 million francs, is likely to have a great influence on Marseilles as a port, as the Etang de Berre provides in its quite close proximity an outer spacious harbour for the reception and distribution of heavy goods for the interior and within the Marseilles urban area. The ambitious scheme for the development of the Rhone from the Swiss frontier to Arles, with the threefold object of making it navigable to Geneva, of obtaining about one million horse-power from a number of power stations (Valence, Montélimar, Avignon, etc.), and of irrigating the adjacent lands on both banks, which was to have been undertaken by a semi-public organization with a capital of 360 millions, with the participation of the State, the municipalities (e.g., of Lyons, Paris), the departments affected, the Paris-Lyons-Mediterranean railway, and of other public and private bodies and persons, has not yet materialized. A beginning, however, is now probable with the construction of the first part of the Grand Canal of Alsace.

France acquired much equipment for its Rhine traffic as a result of the Treaty of Versailles, having received in river boats about 300,000 tonnage, and in tugs a total of 33,200 h.p., besides equipment such as cranes, metal moving-bridges (*ponts transbordeurs*), silos and sheds.

Although since 1914 the production of power by the French water courses tripled from 647,000 to 2,000,000 kw., yet over two-thirds of the estimated capacity remains undeveloped. Lack of money rather than of plans has delayed progress in recent years. The present power is produced mainly by the waters of the French Alps, the Savoy and Provence (60%) and of the Pyrenees (25%), but some important works have been established recently on the Dordogne, the Truyère and the Creuse.

Ports.—Few ports with exceptional natural advantages are to be found along the lengthy coastlines of France. The principal existing Mediterranean ports, Marseilles, Toulon, Sète, Port-Vendres, had relatively few natural harbour facilities or convenient spaces for docks or warehouses at their immediate disposal, either being cramped at the foot of hills, or, like Sète, having low levels and waters on the land side; and some considerable ports in earlier ages, such as Narbonne and Aigues-Mortes, have ceased to be.

The principal ports are Marseilles, Rouen, Havre, Bordeaux with its outports, Dunkirk, Nantes, St. Nazaire, Cherbourg, Boulogne, La Rochelle-La Pallice and Calais. Their relative position may vary according to the standard of estimates adopted (tonnage of ship entries and clearances, tonnage of goods handled, passenger traffic). Cherbourg, now mainly a port of call for transatlantic liners, showed in 1925 a superior ship tonnage (21.9 millions) to Marseilles (18.7), Havre (8.5), Bordeaux (3.7) and Rouen (3.2), but these and others have greater real significance as places of maritime and trade activity. For passenger traffic, the leading ports are Marseilles (about 700,000 in and out annually), Boulogne (550,000 to 600,000), Calais (500,000 to 580,000), Havre (in 1926, those to and from foreign countries, 306,900), and Cherbourg (from 68,700 in 1913 to 200,000 in 1926). Marseilles, which has the practical monopoly of the passenger and goods traffic for the Rhône valley and the south and south-east of France, for north and east Africa, for the Near and Far East (it has been a great beneficiary of the Suez canal, but its great Mediterranean rival, Genoa, by reason of the Alpine tunnel routes to Switzerland and the Rhine, has diverted to itself much traffic) is the leading port. Rouen, the second port, leads for coal imports (3 to 4 million tons) and for mineral and other oils (800,000 tons); Havre for cotton, coffee, oils, and the export of luxury and valuable goods; Dunkirk for wool, jute, linseed; Bordeaux for imports of products from Morocco, Senegal and Martinique (e.g., ground nuts, rum, sugar), and for exports of wine

and pit props; Boulogne and Fécamp for fisheries. It may be noted as a characteristic of French maritime traffic that, as a consequence of the necessity of importing in large quantities coal, copper, petrol, cereals and other heavy raw materials, and of the predominant character of French exports (textiles and other manufactured goods), there is a wide disparity between the weight of the imports and of the exports, the latter being about one-third of the former. The two important inland river ports are Paris and Strasbourg: at Paris about 6½ million tons are annually discharged, and about 2 million loaded.

Brest and Toulon may be regarded as almost solely naval stations and arsenals, although certain attempts are being made to develop the commercial traffic. At Cherbourg, which with Bizerta under the 1925 Government Bill was to rank as an auxiliary arsenal but to be reduced in peace time, the work of the old arsenal appears to be concerned for some years only with ordinary ship repairing: Lorient, under the same Bill was to specialize in ship-building, but by the State construction of the fishing port Lorient-Kéroman (opened in 1927), it appears likely to lose its naval port character.

The State has played a great part in all matters connected with French ports since the Napoleonic period: and their construction, maintenance and administration are still subject to the Ministry of Public Works. The prior authorization of the State is no longer obligatory before undertaking new works, but as the State makes large grants for improvements, it retains an effective control: for all the other ports the centralized system remains, and in 1924 there were created by decree as directors thereof, engineers of the State service. The extent of the annual State grants for capital expenditure has been considerable, having been 19.5, 16.5, 70 and 122 millions in 1912, 1913, 1918 and 1919; but since 1920, owing to the financial stringency, they became lower in gold value, having been 42, 31, 28, 26, 23 and 20 millions in the years 1920-25. The tendency is growing to hand over a greater part, not only of the financing, but also of the management of French ports to the Chambers of Commerce, which are powerful bodies in France regulated by law. In the national programme for the improvements and extensions of the principal seaports (16 in number) regarded as indispensable which was presented by the Ministry of Public Works to the National Economic Council and approved in July 1927, the total expenditure is estimated at 1,478 millions, of which the State would provide 649, and the local interests 829 millions.

For the handling of goods, large new provision has been made since 1914. The total length of quay railway lines has increased by about 650 miles. Cold storage plants have been erected at Havre, Dunkirk, Kéroman-Lorient, St. Nazaire, La Pallice and Marseilles. In some cases (e.g., Marseilles and Strasbourg) large cereal warehouses or silos have been built. Ship repair facilities have been increased by the building of dry docks or by the acquisition of floating docks.

Mercantile Marine.—The French mercantile marine, whose gross tonnage rose from 2,300,000 in 1913 to 3,441,000 tons in 1928, now ranks as sixth in the world, after those of Great Britain, the United States, Japan, Germany and Italy (3,480,000). Both Italy and Germany had in 1927 a far larger tonnage under construction than France (227,000 and 408,000, respectively, against 137,000 tons). According to an official statement, 800,000 tons of the French mercantile marine are now represented by vessels of over 20 years of age, which will be unusable in a few years, and new annual building of 150,000 tons will be necessary to maintain its present total figure. One noteworthy change in French shipping is the reduction in its former unusually high tonnage of sailing vessels, which from 561,000 tons in 1914 sank to only 158,000 tons in 1928: this change is due, partly to the opening of the Panama canal, which has brought more steamers into the nitrate and corn carrying trades, partly to the greatly increased utilization of steam trawlers in French coastal and distant fisheries, and not least to the general trend towards the elimination of the slower type. At the present time, out of a total of 4,654 vessels, about 2,358 are steamers: in 1926 none, and in 1927 only one, sailing vessel of over 100 tons was launched in France, against

34 and 21 steamers or motor-driven vessels. Notable features in recent years have been the appearance of several large steam trawlers (1,000 to 2,000 tons), the increase of cold storage vessels (now about 65 in number), mainly used for the growing import meat trade, and of oil tankers, whose gross tonnage has grown since 1919 from 30,000 to 360,000 tons. Several great liners, e.g., the "Paris," the "Ile de France" (43,500 tons), have been launched in recent years for the Atlantic service, and two liners of 15,000 tons were built in 1927 in Germany as reparations in kind for use on the Indian ocean services.

In French vessels is now carried a larger proportion of the total imports and exports: the percentage of tonnage of goods imported in French ships was 48% in 1925, against 17.3% in 1913, and that of the exports was 53.3, against 35.8%.

The French shipping trade has undergone the same concentration tendency as in many other countries, and is now controlled by a few concerns. The largest company, which directs a fleet of 754,000 tons, made in 1928 a formal working agreement with another company whose group controls about 550,000 tons, and which works by agreement respecting important markets with a third group controlling about 440,000 tons. The effects of such arrangements have been noteworthy, and concentration has resulted in both the simplification and facilitation of shipping trade. State aid is no longer given directly for shipbuilding, but subsidies are paid to the shipping companies for the mail and other services. A new government measure for financial assistance for shipbuilding through the agency of a maritime credit institution (*Crédit maritime*) was passed in 1928, whereby the great French mortgage bank known as the *Crédit Foncier* will undertake to place for five years an annual average sum of 200 million francs at the disposal of shipowners for the building or purchase of ships.

THE NEWER COMMUNICATION SERVICES

Postal and Wireless Communications.—The State postal and allied services for communications purposes have shown some noteworthy developments since 1913. Post offices had increased from 14,600 to 16,462 at the end of 1927, pillar boxes from 84,500 to 91,800, and the total of all units carried (letters, cards, printed matter) in the year from 3,397 to 5,920 millions. Post-cards had diminished, as had the pneumatic missives (30% less than in 1913). The payment on delivery system had made notable progress: in number of items from 16.7 to 32.8 millions in 1926, and in turnover from 17 to 829 million francs. The institution of the postal cheque in 1918 proved highly successful: the number of accounts grew from 9,012 with credit balances of 187 millions in that year, to 369,485 accounts with 3,497 millions as balances in 1927. Aerial telegraph lines increased from 121,000 to 222,000 miles in total length, and offices from 23,117 to 33,166, but the use of the telephone for medium distances and the extension of wireless affected the actual traffic (in the year 1927 it was 22% less than in 1913).

Telephonic communication has immensely developed (subscribers in 1927 totalled 848,522 against 310,000, the telephonic staff 18,093 against 7,952), although France still occupies a very low place (about the 20th) among nations as a telephone user, showing about two per 100 inhabitants, and even Paris and Lyons showing only 11.1 and 3.9 per 100 inhabitants. As a result of much aerial construction, Paris connections with foreign capitals (e.g., Madrid, Zurich, etc.), have also been greatly improved in late years. The installation of the Rotary automatic telephone system has already made progress. In Bordeaux the transformation for 10,000 subscribers was completed in 1927: in Paris, 4 new central stations, each with 10,000 lines, were finished in 1928, and by 1940 it is estimated that 40 such stations will be in operation in the capital.

Wireless telegraphy has become popular in France, although it has not yet attained the same remarkable vogue as in Great Britain, Germany or the U.S.A. (a French statement that the value of wireless manufactures in France in 1926 reached only 500 million francs indicates the relative position in this respect). It is especially practised round Paris and Lyons and in the north and east, where the good contacts with English and German

stations are largely utilized. No stations of the same power as Daventry or Chelmsford have yet been created in France, where the most powerful are St. Assise at Melun near Paris (with two emission stations, one the *Continental*, 22 kilowatts and wave length 1,500 metres, and the second the *Transcontinental*) which is in private hands, the Eiffel Tower (12 kilowatts) in Paris, and the Bordeaux-Lafayette at La Croix-St.-Hins, both belonging to the State. The State conducts a wireless station (with 500 watts, which may be raised to 10 kilowatts) at its higher school in Paris, and has established regional stations with rather low powers at Lille, Lyons, Toulouse, Marseilles, Grenoble and Rennes.

French writers incline to ascribe the slower development of wireless in their country to the lack of really powerful stations, and to the absence of central direction, so that the various broadcasting stations (e.g., in the Paris region) may use their own various wave lengths. Powers of control to be taken by the Government were indicated by the decree of Dec. 1926 (whose provisions have still to be ratified by Parliament); liberty is to be left to the small private wireless installations, but for broadcasting purposes there are to be established three great national stations and eighteen regional stations, which are to be worked by the State or under conditions permitting the eventual cession of the undertakings concerned to the State. As from 1933, the State will become proprietor of all broadcasting stations which it will work in entrusting the programmes to collective organizations representing public bodies, great representative associations of trades or occupations such as the wireless industry, authors, composers, press, as well as the general public.

Civil Aviation.—France, like other countries, has given substantial subsidies to civil aviation. In the five years 1924–28 State grants amounted, respectively, to 138, 153, 143, 169 and 218 millions. Individual air transport companies receive large annuities from this source: in 1928 the company operating the new service France-South America is allotted 39 millions with an additional 23 millions for other services, and those operating the Paris-Constantinople and the London-Paris-Paris-Marseilles lines received in 1927, respectively, 20 and 17½ millions. Although traffic greatly increased between 1919 and 1925 (passengers from 588 to 25,010 in 1925, goods from 8½ to 1,114 tons, and postal packets from one to 173 tons) yet in 1926 and 1927 passengers carried numbered only 13,635 and 15,857, goods 768 and 746 and postal packets 156 and 125 tons. The monetary returns are still far from meeting the outlay involved. Within France distances are rarely sufficiently great to attract passengers or goods to the use of internal services, and after various trials the purely internal passenger services may be regarded as abandoned. The fairly successful external services have been chiefly fed by foreign travellers. Save with Great Britain, the foreign services appear unprofitable, mainly because traffic eastwards and southwards into Europe is confronted by the competition of important native undertakings (e.g., Germany, Italy, Switzerland), which tend to secure passengers into and from their surrounding border countries. The air services are, however, much utilized by the postal authorities, especially for North Africa and Senegal and in March 1928 an air postal service from France to South America was put into operation. The creation of about 12 internal night mail air services between Paris and important French centres and between Bordeaux and Marseilles and Marseilles and Alsace-Lorraine is suggested. In 1928 there were six aerial navigation companies.

The aircraft industry in France has enjoyed much prosperity in recent years. It receives a large measure of State support (36, 40 and 40 millions in 1926–28 for industrial investigations and experiments), and large prizes are offered to the manufacturers of aircraft and of motors whose products gain records.

SOCIAL CONDITIONS

Unemployment.—No national compulsory unemployment insurance scheme is yet in operation in France. In April 1928 was promulgated, however, the Social Insurance Law voted in March, in accordance with which all workers in receipt of wages not exceeding 18,000 francs a year must contribute to a scheme which insures the risks of illness, premature unfitness, old age

THE BRIDGE OF NOTRE DAME AT MENDE

An etching, by John Taylor Arms, of the 14th century bridge crossing the river Lot at Mende, a small city in the Cevennes, in the department of Lozère. In the south of France, Mende is on the principal avenue of approach from the north to the gorge of the Tarn. The spire of the 15th century Gothic cathedral is seen on the left; in the distance is the Causse de Mende, a mountainous wall rising 1,100 feet above the town

and death, and participates in burdens connected with maternity and unemployment. The sole benefit under the last-named head consists in the payment for the insured, for a maximum period of three months in any one year, of the 10% illness insurance contribution. The law, which is likely to be subjected to revision, cannot become operative until 10 months after the issue of the administrative orders for which a limit of a year is allowed. The only available unemployment record of any scope consists in the weekly returns of the numbers of recipients of unemployment benefit from 233 local and 31 county unemployment relief funds. These funds, which are seen to be maintained by a relatively small proportion of these public authorities, are non-contributory for the worker, and may receive aid from the State, which may also make grants to the unemployment funds created by trade unions or by friendly societies. Their records, although they are not as broadly based as those of Great Britain or Germany, and cannot provide any percentage figures for whole trades, yet may be regarded as indications of prevailing conditions, having been kept on the same basis for many years. A French official figure relative to the years 1911-13 (but not available for subsequent years) gives the percentages of trade unionists unemployed as averaging 5.7, 5.4 and 4.7, respectively, for these years. Since the close of the war, save for about nine months after the economic collapse in the summer of 1920, and for four or five months in 1927, unemployment has been non-existent in France, which has enjoyed an unbroken span of tense industrial, commercial and agricultural activity. The relief funds assisted (average monthly totals for the six years 1922-27) 5,122, 1,900, 695, 705, 1,289 and 33,652 persons. The movement in these records was completely confirmed by the fact of the unceasing stream of immigration of industrial and agricultural workers into France over the same period, or by the slackening thereof in 1921 and in 1927. In 1928 France appeared to have settled down into a phase of good regular employment after the feverish period which ensued in 1922-27 through two principal causes—(1) the immense credits set in motion through loans for the reconstruction of the devastated areas which gave great buoyancy and purchasing power in the home market, and (2) the depreciation of the franc in relation to the currencies of many strongly absorbent foreign markets (e.g., Great Britain, North and South America, Spain, Holland, Switzerland), which induced an immense increase in both the visible and invisible exports thereto.

National Thrift.—The two definite institutions of a public nature for the receipt at interest of the savings of the people are the National Postal Savings Bank (established by law in 1881) with approximately 14,000 receiving offices, which is managed and guaranteed by the State, and the so-called private savings banks, which date back to 1818, and which transact a far greater volume of business, about 560 in number with 1,900 branches. They are local undertakings established by decree on the initiation of the local authorities, and managed under rules corresponding to those applicable to public institutions. Freedom of investment of their deposits is not permitted; all deposits must be lodged with the State institution known as the Deposits and Consignments Fund. Certain particulars respecting the operations of these institutions are here given: in both groups total deposits and average accounts are seen to fall very far short of the fivefold multiple required to bring them to the gold value of the pre-war figures.

It must be emphasized that for few countries less than for France have savings bank transactions been a just test of popular thrift, and that this fact has acquired more than usual validity since 1919. For generations nearly all classes (including peasant proprietors, domestic servants of both sexes, commercial and industrial workers) have been wont to invest considerably in State, departmental, municipal, railway and other standard securities home and foreign (e.g., apparently there are 1½ to 2 million French holders of pre-war Russian securities). The bulk of these were bearer, therefore easily transferable, and purchasable in small amounts. Investment in foreign securities by people of small means has waned as a result of bitter European experience since 1914. National defence bonds of various denominations from 100 francs have absorbed in streams since their creation (1914) the

(a) Post Office Savings Bank						
Year	De- posited	Paid out	Total deposits end of year	Number of ac- counts	Average of ac- counts	Accounts to 1,000 of popu- lation
	Million Francs			Thousand Francs		
1913	660	630	1,818	6,406	283	163
1925	1,679	1,295	3,936	7,417	528	172

1927	5,768	2,906	14,606	9,036	1,604	221

popular savings, as they have offered a better interest, payable in advance.

Relief of Poverty.—Public assistance to the necessitous in various conditions and circumstances has been legislatively ordained since the Revolution, and much additional legislative provision of diverse kinds has been instituted under the Third Republic. The ordinary poor law relief is administered through the local relief offices known as *bureaux de bienfaisance*, which, directed by committees appointed by the local authorities, provide assistance at domicile, and other assistance, whether in kind in the form of coupons for food, fuel, clothing, or in money as rent advances, repatriation allowances, and others. In Paris each of the 20 districts maintains its bureau. Exclusive of the capital, the numbers annually relieved in France by these organizations from 1871 to 1912 ranged from 1½ to 1¼ million, but since 1920, no doubt owing both to the persistence of brilliant economic conditions and to the institution of other relief services, the annual average sank to about 750,000. Public medical relief is provided on a large scale. "Every sick French national, without resources, shall receive gratuitously from the commune (local authority), the department or the State, according to his domicile for relief purposes, medical assistance at his dwelling, or, if proper care cannot be there afforded, in a hospital" (law of July 15, 1893). This gratuitous medical assistance, organized by the department and supplemented by subventions of the local authorities, was provided before the war to two million persons annually, and since the war to 1.6 million, of whom both before and after the war 800,000 were attended at their dwellings, and (since 1920) from 150,000 to 180,000 at hospitals. Hospitals and homes for unfit, incurable or aged persons under the general public scheme, which in 1925 numbered 1,863, of which 226 are classified as hospitals, of which 43 in Paris, 558 as hospices (18 in Paris), and 1,081 as combined hospitals-hospices (8 in Paris), treated annually 1920-25 from 750,000 to 868,000 persons, and housed at the end of each year from 67,000 to 76,500 unfit or aged persons. The number of children assisted annually is about 150,000 at the cost of approximately 120 million francs: of aged 70 years and more, about 370,000, and of unfit and incurable, about 185,000. Of 107 existing lunatic asylums, 73 are maintained by public funds. Special public institutions take care both of abandoned children and of children of persons who may renounce all control of their children. By laws of 1913, 1917 and 1919 a daily maternity allowance (in Paris of about 2 francs) may be accorded to mothers "without sufficient resources," which has been interpreted to apply in cases where fathers' daily earnings do not exceed 24 francs; and a monthly nursing bonus of 15 francs may be paid during 12 months: benefit cases under the former and under the latter heading now number 300,000 and 250,000 a year. Heads of families of over 3 children may also receive under certain conditions a yearly State allowance of 90 francs for each after the third up to the age of 13 years. Public health provision since 1916 has included the institution of 500 to 600 dispensaries, besides sanatoria or preventoria with 12,000 beds, mainly for consumption prevention or cure. The State has assumed the burden of the education and protection up to majority of all children whose father, mother or family sup-

port died through war service (about 700,000 children have come under this scheme); and the provision of free board, lodging and education for those mutilated in the war (e.g., schools for the blind, limbless, etc.).

Important public provision is also made towards the old age pension scheme. In 1850 was created the National Old Age Pension Fund under the guarantee and practically under the control of the State, which aimed at providing annuities on the voluntary contributory system: from 1920-24 about 750,000 policies representing annuities of about 140 million francs were in operation. But in 1910 was introduced for wage earners of both sexes in non-State employment a compulsory contributory system (State, masters, workers) payable at sixty for those in receipt of under 3,000 francs a year, and optional for those with from 3,000 to 5,000 francs, and for agricultural labourers and small masters with only one non-own family worker. Miners and sailors come under special regulations (miners are entitled after 30 years' service and at age of 55 to 3,000 francs a year, and their widows to 1,800 francs, besides invalidity pension of 2,160 francs). At the end of 1924 the number of persons under the insurance obligation was 7,735,000, and of optional insurers (in 1922) 286,300. It should be added that in France a large number of important undertakings both in industry and commerce possess their own old age pension schemes also on a contributory basis, or supplement their statutory obligations in this respect. A large proportion of the aid societies (*caisses de secours*) attached to so many factories also maintain old age schemes providing larger than the statutory annuity.

Wages.—The only available official wages indices, given in the following table, which are based on returns of normal earnings in 21 ordinary male occupations in Paris, and on 38 male and 7 female occupations in provincial towns, show (1) that in 1927 in the capital daily male earnings are five and in the provinces six times those of 1911, but that hourly earnings have advanced in greater proportion, and (2) that female earnings in the provinces have risen in greater ratio than those of males. Hourly earnings are greater because daily earnings tended to be maintained on the old scale although the day was shortened by law in 1919 to 8 hours from the predominate number of nearly 10. Female wages in the Paris area may be said to have also increased in greater ratio than those of males; e.g., in the dressmaking and domestic service occupations the indices for various categories reach 650 to 690.

Indices of Wages (1911=100)

	1921		1924		1926		1927	
	D	H	D	H	D	H	D	H
Paris (21 occupations)	354	423	393	473	510	583	513	585
Provinces:								
Men (38 occupations)	410	502	477	570	584	700	593	720
Women (7 occupations)	412	509	496	600	668	809	648	787

D=daily and H=hourly.

As regards wages in certain staple occupations. The available figures show an index of 576 for the French coal miners (excluding certain benefits such as houses at nominal rents for over half of all coal miners, medical attendance, pension contribution, etc.). In the Paris area for 230,000 metallurgical and engineering workers the general index in 1928 is 573, with 525 for skilled and 622 for semi-skilled. In these trades the family allowances give an addition of about 12% per worker with 2, and from 20% per worker with 3 children. Railway workers' index is 558 for a man without children, 675 for one with two children. State manual workers (State servants total about 800,000) have abundantly partaken of the increase in wages: e.g., foresters in receipt of 800 francs in 1913 now receive 6,900; canal lockmen formerly 550 to 700, now 6,900 to 8,500 francs. Perhaps the present general coefficient for the earnings of manual workers may be put as at least $8\frac{1}{2}$, as the minimum annual wage of 8,000 francs came into operation in 1928, and family allowances are payable. In 1927 the French Prime Minister stated in Parliament that the index figures for the

various categories of smaller salaried workers ranged from 550 to 700, and for the upper salaried workers was 160. Subsequent increases bring these indices to from 616 to 784.

Prices.—In general in 1927, wages had quite overtaken prices. The cost of living index figure averaged 498 for that year. Rents, however, which are reckoned at 12% for weighting purposes, have been subjected to restrictions, and show still an index of only 275. As to the food group (60% for weighting purposes) it may be noted that it comprises only 13 items, among which coffee and wine are not included.

Indices of Prices (1914=100)

	1924	1926	1927	1928
Wholesale:				
General index (45 commodities, of which foodstuffs 20 commodities)	499	718	630	633
Retail: (13 commodities)	442	619	584	649
Paris	360	574	539	544
Provinces	401	610	553	530
Cost of living, Paris region	377	545	498	519
Sterling rate (1914=25.13)	85.18	153.25	123.88	124.21

Important Social Changes.—Certain social changes of great importance have been enacted since the close of the war. The introduction in 1919 of the compulsory 8-hour day was indeed epoch-making for a country where the 59 or 60 hour week was still customary in most trades (with 54 to 57 hours in a few skilled and organized trades), where the previous legislation permitted 12 hours of effective work, where one compulsory weekly day of rest, not necessarily Sunday, had been introduced only 13 or 14 years earlier, and where the Saturday half-holiday was extremely rare either in commerce or in industry. Its immediate complete and general application under these conditions would have been subversive of the national economy, so that it was provided that its application would be determined only by special decree, after consultation with the organizations of the masters and of the workers representing a whole industry, trade or craft, and for the whole territory of France or for a section thereof. In general the unit for distribution of the 48 hours was the week, but in certain cases the two-weekly unit was taken. Permanent or temporary dispensation authorizing over a whole yearly period additional rations of working hours over the 48, but so as not to exceed as a rule 9 hours any day, were also determinable by the decree. Up to 1927 about 50 decrees had been promulgated covering about $4\frac{1}{2}$ million workers (agricultural occupations do not come under the law, and the mercantile marine and the mining industries are mainly regulated by special laws). All State workers also are liable only to an eight-hour day. The 1919 law has in effect reduced the ordinary manual worker's day to an average of about $8\frac{1}{2}$ to $8\frac{3}{4}$ hours: for the decrees usually allow a regular annual addition of 100 to 120 hours (even more, e.g., 150 in retail trade, in the building, paper, textile, pottery and porcelain trades, 200 feather dyeing, fur making-up and some occupations in the wholesale and semi-wholesale trades), plus exceptional or temporary additions, or compensation for time lost through the collective interruption of work due to accident or *force majeure*, or to public holidays or local *fêtes* (this compensation allowance for holidays means that a considerable part of the 64 or 72 hours of annual holidays may be recovered within the 48 or 96 hour period in which the loss occurs).

Family Allowances.—The most widespread innovation in the industrial welfare domain has been the generalization of the family allowance system. Its payment has become the established practice not only in the case of State employees of practically all grades, who total about 800 thousand persons, but also generally in the railway, mining, metallurgical, engineering, chemical, textile, printing, building and transport trades. There are in existence about 200 clearing houses or compensation funds formed by masters for the execution of their liabilities, which embrace 14,000 to 15,000 factories with approximately 1,400,000 wage-earners. The amount of the allowances means a considerable addition to the well-being of the recipients—the mining

companies allow 3 francs a day for each of the first two, and 2.50 francs for the third and fourth, child; railways may allow 80.4, 1,608, 2,910 and 4,212 francs a year to workers with 1, 2, 3 and 4 children and the textile trades of the north, 2.30, 5.75, 9.20 and 13.80 francs a day for 1, 2, 3 and 4 children.

Other widespread forms of welfare provision in French industry are housing schemes. The mining industry houses about 40% of all its workers; many great metallurgical, engineering, rubber and textile firms make large provision in this respect.

(J. R. C.)

HISTORY

The history of a people is determined by the land which they inhabit. Geographically, France occupies a very happy position between continent and ocean. Situated at one extremity of that indented peninsula known as Europe, France is on three sides closely united to the body of the continent—at once and equally a maritime and a land power. If her position between north and south made her from earliest times the meeting-place of peoples, she has also had the task of defending on the north and east her very extended land frontier and her long sea-coast. Hence French governments have been ever torn between two essential, but not always reconcilable policies.

Earliest Gaul.—The foundation of Marseilles about 600 B.C. by Greeks from Asia Minor affords the first approximately accurate date in French history. A second and even more important invasion was that of the Celts, or Gauls, a tall, blond race who came from beyond the Rhine and spread themselves throughout Gaul in successive waves of immigration during the course of two or three centuries until it became a celto-ligurian country. Settled in distinct tribes, the Gauls never achieved a centralized government. The victory of Caesar over the Gauls (57–52 B.C.) was, above all, due to the fact that he never had to face a united Gaul; until, after six years of spasmodic effort, it united for a day round Vercingetorix only to die heroically at Alesia.

Roman Gaul.—The Roman conquest brought civilization in its train. The assimilation of a conquered people is an essential of successful conquest, and in this art Rome was a past-master. Roman rule was a harsh but beneficial discipline, and Gaul speedily forgot its independence, although an attempt was made (A.D. 252–273) to establish a Gallic empire. The *Pax Romana* was seen to be preferable to the former anarchy: thanks to the existence for three centuries of a common policy, language, religion, and administration, Gaul prospered under the Romans.

THE BARBARIAN INVASIONS

Despite the benefits of the *Pax Romana*, the strongest bond uniting Gaul and Roman was their common fear of the Barbarians who thrust themselves unceasingly against the eastern frontier. Many times already the storm had burst over Gaul. It had required a Marius to stem the torrent of the Cimbri and Teutoni (102 B.C.), a Caesar to hurl back the Helvetii into their mountain fastnesses (58 B.C.). Then the western horizon brightened until the disaster to Varus wounded cruelly the pride of an Augustus. Abandoning the conquest of Germany, the Romans for two centuries entrenched themselves behind the fortified frontier line that ran from Cologne to Ratisbon, affording a protection to which the Gauls gratefully acquiesced. But under the pressure of migrating tribes upon those already settled, the German invasion gradually penetrated across the frontier, now in the guise of colonization, now in that of war. Suddenly, at the beginning of the 5th century, owing to a violent forward-thrust of the German tribes, themselves subjected to the pressure of the Huns, the Rhine frontier, denuded of guards by civil wars, was swept away. For 70 years (405–475) the tempest raged over Gaul.

The Western Barbarians.—The Barbarians were a group of tribes and not a single nation. For them there was so little question of substituting a Barbarian empire for that of Rome (for which they entertained a superstitious reverence) that their conquests seemed to them illegitimate without imperial ratification. When the first storm had passed, the Visigoths had established a powerful kingdom from the Loire to Andalusia; the Burgundians

set up another in the valleys of the Rhone and Saône; finally, the Franks, divided into two groups, settled in northern Gaul; the Ripuarians round Cologne and the upper Moselle; the Salians round Cambrai and the Somme. For a last time all the Barbarians, auxiliaries of Rome, ranged themselves under Aetius in 451 to overthrow near Chalons the hordes of Attila. Then the empire of the West retreated over the Alps to die.

The Church and the Barbarians.—The Roman Church, which survived the Empire, inherited to some extent the Imperial attitude towards Barbarian Europe. Gradually the City of God came to take the place of the Roman State as the guardian of civilization. That they might re-establish order, and maintain it, the bishops—"defenders of cities"—sought from the Barbarian kings the support they had hitherto received from the empire in their contest with the Arian heresy (which denied the divinity of Christ and the Holy Trinity) and all the survivals of paganism. But the Visigothic and Burgundian kings were infected with Arianism, and to them the Bishops were inevitably opposed. The Franks, who were to give to the land its permanent designation, and who were to play so great a rôle in its history, seemed as yet far from such pre-eminence: they were less civilized than the Visigoths and Burgundians, and they were pagans, and by a double paradox, it was this that helped them. Their strength as fighters enabled them to extend their power and keep out fresh invaders, and further, the Church has always preferred pagans to heretics. The conversion of Clovis to the orthodox faith was a master-stroke: at one and the same time, it made his fortune and that of the Franks. A common faith was to become the token of a unified State and the foundation-stone of Christian France.

THE MEROVINGIANS

Clovis.—Clovis was the king of only one of the tribes of Salian Franks who, under his father Childeric, had come in search of new lands to cultivate in the rich valleys of the Somme and the Oise. When the victory of Soissons (486) over the Syagrius, who represented the Roman power in the west, had brought the power of Clovis to the Seine and then to the Loire, Remigius, archbishop of Rheims, made a swift decision. To Syagrius, now a fugitive among the Visigoths, he preferred Clovis, who as an ally could be as useful as he would certainly be dangerous as an enemy. For his part Clovis well understood that he would never bring Gaul beneath his sceptre without the support of the Church, and the Catholic Gallo-Romans who were tired of anarchy. Clovis laid the foundations of the French state by his conversion to Christianity, due to his wife, Clotilde, and to Remigius, rather than by his victory over the Alemanni at Tolbiac (496). From that time forth his conquests took on the character of holy wars; by the victory of Dijon in 500, Burgundy became subject to him; in 507, by his victory at Vouillé, he set free the whole valley of the Garonne from the Arian Visigoths and forced them back into Spain. In order to prevent a possible coalition of the Frankish tribes that had remained heathen, Clovis deposed and assassinated their kings. In these murders the Church saw only the divine reward to a faithful soldier and a convert from paganism, and gave her consecration to his triumph by appointing him to preside over the Council of Orleans (511). Clovis, like the Christian emperors before him, became for the Church a new David. Finally, the Eastern emperor, Anastasius, by sending him the consular emblems gave a legal sanction to his rule, even as the Church had sanctified his military conquests. Thus the Merovingian dynasty was enabled to hold sway for two centuries and a half.

The Successors of Clovis (511–752).—After the death of Clovis, his house produced no monarchs worthy to rank with him. Neither the Roman law nor the influence of Christianity was strong enough to preserve the unity of the state. The custom among the Franks of partitioning the royal domains at the death of each king to the exclusion of the female line, as though the kingdom were a private estate, coupled with the avariciousness of the princes, occasioned constant civil wars. Thus, at the death of Clovis (511) his domains were divided into four kingdoms. For 50 years, indeed, his heirs sought to continue his work

and to add to his dominions. From 523 to 532 they subdued Aquitaine, Burgundy and Provence, and love of booty brought their armies into Italy and Spain. Two centuries before Charlemagne they even attempted the conquest of Germany. Owing to the accident of Clotaire I. surviving his three brothers the dominions of Clovis were re-united from 558 to 561. But on the death of Clotaire, his kingdom was once more divided among his four sons, and during the years 567-613, domestic tragedies checked the progress of the Merovingian power, and took the place of wars of aggrandizement and pillage. No trace is to be found of any political ideal in the wars between Chilperic and Sigebert. Chilperic's murder of his Visigothic wife Galswintha, may have caused her sister Brunhild, wife of Sigebert, to urge her husband to make war, though ambition was urge enough. After Sigebert's death Brunhild carried on the strife. Her bitter rivalry with Fredegund, Chilperic's widow, is the thread on which the history of continuous war is hung. The central authority grew steadily weaker. It was further threatened by the growing power of the bishops and great nobles against whose aggressions Brunhild strove all her life. Two landmarks in this struggle are the treaty of Andelot in 587 and the edict of Clotaire II. in 614 by which benefices granted to the aristocracy of high officials were made tenable only for life. But these exhibitions of strength were but momentary and could do little to arrest the steady development towards the feudal days (*see* FEUDALISM). The ordinary freeman, unprotected owing to the weakness of royal power, was driven to commend himself to the local bishop or great noble.

The Mayors of the Palace.—From the 7th century onwards, the mayor of the palace (*q.v.*: *see* also MAYOR), seriously weakened the already failing authority of the kings. The palace in those days, as in the time of the empire, and in mediæval times was the court of the king and the seat of his government. The mayors controlled this ambulatory court and in effect, controlled the State; they sought, not only to be independent, but also to establish over the rest of the Frankish kingdom the supremacy of that division over which they ruled. Some tried to re-establish a unified Frankish monarchy and the rule of the State over the Church; others, who were distrustful of the idea of a single kingdom, sought above all to assure their own independence. For a century (613-714) these two opposing tendencies can be traced. After a brief revival of the royal power under Dagobert (628-638) there ensued its long decadence with meaningless partitions, perpetual minorities, the ever-increasing power of the mayors over the *rois fainéants*, and, finally, the duel between the Neustrians of the West and the Austrasians of the East, and the great conflict between Ebroin, mayor of Neustria, and archbishop Léger, who was all-powerful in Burgundy. The battle of Tertry (687) finally decided the struggle in favour of the Austrasians under Pippin of Héristal; but the death agony of the degenerate descendants of Clovis was prolonged until 752.

THE CAROLINGIANS

Merovingian savagery and chaos ended in a general paralysis of the State. A new Clovis was needed, and found in Pippin II. of Héristal. In his person he united the two great houses of Pippin and of Arnulf, archbishop of Metz. The Pippins, from father to son, had succeeded to the mayoralty of the palace in Austrasia from 615 to 655. They had at their back a great company of vassals and vast landed estates; above all they had patience—without which nothing lasting can be built. It took them nearly 100 years to supplant the Merovingians by the Carolingian dynasty.

Pippin of Héristal governed under four kings. A pioneer, he began all those tasks which his descendants were to carry to completion; he was himself precipitate in nothing. As warrior, he defended the frontiers that were threatened by the Frisians, the Alamanni and Bavarians; as a son of the Church, the descendant of Arnulf, he brought in the train of his armies, missionaries through whom the Carolingians were to consolidate their conquests. He died in 714 without having deemed it opportune, or without having found the occasion, to sweep away the phantom

kings whose sole utility was to date charters and diplomas.

Charles Martel (714-741).—With Charles Martel began the greatness of Austrasia. He accomplished successfully a fourfold task. Although a bastard, he asserted his power in Austrasia where he deposed his half-brothers from the mayoralty. He achieved the supremacy of Austrasia over Neustria and Burgundy by the victory of Vincy (717). Frankish unity was re-established. He then defended Gaul against the Frisians, the Alamanni and the Bohemians. Without being any more conscious of his mission than was Clovis, Charles Martel proved himself another soldier of the Cross by repelling the Moorish invasion at Poitiers (732), which won for him the appellation of Martel—the Hammer. An alliance with Charles Martel, the pacifier of Gaul, the protector of St. Boniface, and the vanquisher of the "Infidels," became ever more necessary to Pope Gregory III., menaced as he was by the Lombards, and promised to be even more fruitful than was that of Clovis with Remigius. Unable to forget that the Lombards had aided him in expelling the Saracens from Provence, Charles contented himself with professions of zeal.

Pippin the Short (741-768).—Pippin the Short at once took over and continued his father's work. In 747 he became sole master of the kingdom, for his elder brother, Carloman, became a monk and Pippin compelled Childeric III., the last of the *rois fainéants*, to shave his royal locks. Grifon, Pippin's half-brother, was also set aside. It only remained for Pippin to assume the royal title. Consulting Pope Zacharias on this matter and receiving the answer that "he who exercises the king's power should enjoy the king's title," Pippin had himself crowned at Soissons in Nov. 751, an act which was further consecrated in 754 by the grander coronation in Saint Denis, whereby the Church pronounced the new dynasty to be holy and its title indisputable. The title of patrician also conferred by the pope, still further attached the dynasty to Rome. But these rewards were not unearned. During 754-756 it was Pippin who founded, at the expense of the Lombards, that temporal power of the papacy which was to endure till 1870, the bulwark of their spiritual authority. The price for his consecration paid, Pippin, between 758 and 768, assured the safety of his kingdom on the farther bank of the Rhine against the Germans and Slavs, and against the Arabs to the south of the Pyrenees. Moreover, by the alliance between the greatest material force of the age with the greatest moral authority, the way was opened up for a restoration of the Western Empire.

Charlemagne (768-814).—On the death of Pippin in 768 the kingdom was divided between his two sons, Charles and Carloman; but in 771, Carloman died, and the whole of this great inheritance was united under Charlemagne. Charles devoted his half-barbarian genius to the service of the Church and of the traditions of Rome, and in realizing this ideal of his age, earned his appellation of "the Great." He attempted to found an empire after the Roman model. Prevented by the Moors from founding its capital on a Mediterranean site, he placed it in his own native land, Austrasia, with the intention of doing for Germany what Caesar had accomplished for Gaul. Christianity, which had been the weakness of the old empire, was to be the strength of the new. The victory of the soldiers was to be completed by the victory of the missionaries. And thus would a common religion unite peoples otherwise separated by blood, language and customs.

The conquest of Gaul, from Brittany to Gascony (769-811) assured for his armies a reserve of soldiers that cost him nothing, since military service was obligatory upon all free men. The poor and the serfs cultivated the land. Between 774 and 777 he consolidated the patrimony of St. Peter by the destruction of the Lombard kingdom, whose iron crown he placed on his own brow. This accomplished, he turned his forces against the Saxons (*q.v.*), but it took him 32 years (772-804) and 18 campaigns before he was at last victorious. But, unlike the Gauls, despite compulsory baptism, destruction of their idols, and deportation or massacre, these heathens submitted themselves unwillingly to "the easy yoke of Christ." Charlemagne fortified his frontiers by marches, or military districts, but in multiplying these advance-posts the Frankish empire came into contact with new peoples—each a

prospective enemy. In Spain Charlemagne suffered disaster at Roncevaux (A.D. 788) (*see CHARLEMAGNE LEGENDS*) and afterwards created the Spanish March as a defence for his southern borders. From their camp on the Hungarian plain, the tireless cavalry of the Avars had over-run Bavaria in the very year of its subjugation by Charlemagne (788), and it was not before the Danubian lands had been devastated that this new menace was destroyed. Meanwhile, behind the Elbe and the Saale, the Slavs of Bohemia were engaged in an unceasing warfare with the Saxons, and in the north the Danish pirates raided the coasts of the North Sea and the Channel. After 47 years of warfare, the Carolingian empire stretched from the Elbe to the Ebro, and from the Eider to the Tiber—growing greater day by day, but also exposed increasingly to attack. Charlemagne's power extended further than his frontiers. Christian princes from beyond the Channel and the Pyrenees, Moorish emirs from Fez and Baghdad visited his palaces or offered him presents, as to the great Christian emperors. Through men like Alcuin and Peter of Pisa the Church taught this German—still primitive in many ways—the traditions of Rome and Byzantium. Why should not he be the heir to the Caesars? Why should he not restore, in his own favour, the empire of the West? Nothing was wanting save the imperial crown. In 797 the empress of Constantinople had deposed and blinded her son Constantine VI., and the imperial throne might be considered vacant. In 797 the pope had been driven from Rome by a revolt and only restored by a Frankish army. The time was ripe, and at Christmas, 800, Charles was crowned emperor by Pope Leo III.

Of the reconstituted empire, Charlemagne wished to be himself the lawgiver. He was himself the ruler of his empire. He made his power felt to the furthest extremities of the empire by his *missi dominici*, or representatives, by his courts, military, judicial or political. High-handed with his people in this violent world, the emperor believed that he was no less responsible for their eternal salvation in the next. The *missi* enforced his spiritual as well as his temporal authority. By this administrative hierarchy and centralization on the Roman model Charlemagne reconstituted the superstructure of the imperial monarchy; but in legalizing by his capitularies the fief and the beneficium he undermined the foundations of the edifice which he believed himself to be strengthening; by requiring from the greatest in the land the oath of fealty, he admitted that the sovereign of all needed in addition to be definitely acknowledged as the direct overlord of his most powerful subjects; by the extension of *beneficia* the small freeholder gradually disappeared to make room for the feudal tenant (*see FEUDALISM*). The poor free men gave up their freedom to win protection from the neighbouring lord or prelate. Unable to prevent this development Charlemagne systematized it, thinking himself strong enough to turn it to his own account. As long as he lived he was successful; but, even during his lifetime, the treason of Ganelon proved that he was not always served by a Turpin or a Roland. His authority, powerful and respected, decayed because it depended on him, and him alone. When, in 814, Charlemagne was laid in his tomb at Aix-la-Chapelle, his work was buried with him. There remained only a twofold legend—the religious one that made of him a saint; the other that made of him the hero of French epic. Twenty-nine years after the death of Charlemagne the empire had again fallen into three kingdoms; 40 years later, a single one of these kingdoms was divided into seven. A century passed away. France was no more than a scrap-heap of almost independent states, out of which feudalism was springing. The seignorial system, which had at first aggrandized the Carolingians, had also prepared their ruin.

Louis the Pious (814-840).—The empire devolved upon Louis the Pious or affable—titles indicative of his characteristics, so valuable in peace, so calamitous in times of stress. From the beginning of his reign, the clumsy machine of government was out of his control. Like his father and ancestors before him, he retained the entire sovereignty in his own hands, but divided his benefices and offices between his three sons, Lothair, the eldest, whom he associated with himself in the empire, Pippin and Louis. A fourth, Charles, was born to him in 823 of a second marriage, and to him he gave a share also. War between the brothers resulted: the imperial dignity became a laughing stock, and Louis

himself was twice deposed and imprisoned in a monastery. Scarcely was he buried at Metz (840) before his sons rushed to arms. Lothair desired to preserve the unity of the empire and the patronage of all the fiefs in one hand. Louis the German and Charles the Bald leagued themselves against him by the Oath of Strasbourg, the first treaty in the history of France and Germany to be written in the vulgar tongue. An amicable partition of the paternal property was, however, clearly desirable and this was presently effected by a treaty made at Verdun in 843.

The Treaty of Verdun (843).—The Treaty of Verdun marks an important turning point in history. Louis received for his share the land which has become Germany; Lothair the title of emperor, with Italy and the valleys of the Rhone, the Saône and the Meuse, in addition to the two capitals, Rome and Aix-la-Chapelle; Charles, called the Bald, found himself the possessor of the rest of Gaul. The unity of the Carolingian empire was definitely broken. The boundaries between the kingdoms were ill-defined. That of Lothair, without a national basis, soon split up into transient principalities, so that the vast and indeterminate territories of Burgundy, Lorraine and Provence (*q.v.*), were to be the battleground of France and Germany till the 20th century.

Charles the Bald (840-877).—Charles the Bald was the first king of western France. Anxious as he was to maintain the traditions of Charlemagne, he was not strong enough. Rather a man of culture than a warrior, he was obliged to spend his life sword in hand, fighting against the Bretons, against the people of Aquitaine who had appealed to Louis the German, against the Norman raiders who were becoming more and more insolent; fighting always, but always without success. He even found himself obliged to entrust the defence of his patrimony to Robert the Strong, duke of the country between Loire and Seine, and ancestor of the Capetian dynasty. Unable to defend his own kingdom of western France, Charles the Bald yet coveted other crowns, and looked obstinately eastwards. He succeeded in becoming, in turn, king of Lorraine, emperor of Germany and king of Italy: an accumulation indeed of titles, but not of strength.

Growth of the Feudal System.—The great vassals of the crown had remained faithful to Charlemagne because they had had need of his protection. Under Charles the Bald, and still more under his successors, it was the prince who had need of the nobles. Thus was the feudal system turned against the throne, for the great vassals took advantage of it to perpetuate themselves in their offices and in their fiefs, and to gain possession of lands and authority. Little by little the monarchy lost influence, since it no longer performed any services; hence, from the end of the reign of Charles the Bald, there was left but the appearance of royalty—administrative officialdom. No longer deeply rooted in the soil, a shadow without effective force, it hovered above the local powers which encroached upon it, seized its land, and divorced it from its subjects. The king, the lord of lords, was poorer than his lords; while they were establishing themselves in strong principalities, he alone was creating no strong territorial basis for his power. The great vassals were confirmed in their new rights by the capitularies of Mersen (847), of Pitres (862), of Quierzy-sur-Oise (877).

Vassalage could only be a disintegrating, not a unifying factor. That this disintegrating process did not go on indefinitely was due to the existence of 12 or 15 great military commands—Flanders, Burgundy, Aquitaine, etc. (*q.v.*). The duchy of France, which Robert the Strong had received as a reward for his services, grew into a powerful fief, but it was not strong enough to withstand outside attack. In 911 King Charles the Simple gave to Rollo, a Danish chief, the lordship of the district surrounding the lower reaches of the Seine, land nominally under the rule of the dukes of the French. Rollo began to build up the Norman duchy (*see NORMANDY*). The ecclesiastical fiefs emancipated themselves in the same manner as the lay fiefs, and ceased to sustain the royal authority unless it was given into their control. Day by day the disparity became clearer between the vastness of the Carolingian empire, and the feeble administrative control of its weak rulers over a society once again become barbarian and menaced by other barbarians. None obeyed an emperor whom all hoped perhaps to supplant. Each country developed its individual life and language.

The races no longer understood one another, nor possessed common ideals.

The Last Carolingians.—The death-struggle of the Carolingians lasted for a century. Royal power hitherto hereditary, tended to become elective. It was only given to Charles the Bald's son, Louis the Stammerer, after election by the great magnates and bishops under the leadership of the successor of Robert the Strong. Since the kings were no longer rendering service, they could no longer claim service from others, as in the case of Charles the Fat who narrowly escaped deposition for his incapacity and cowardice in face of the Normans. After many intrigues, Eudes (Odo) son of Robert the Strong, was chosen as king in 888 on account of his brilliant defence of Paris. Henceforth there ensued a long duel between the Robertians and the Carolingians, as much literary as political in character. For long the issue was uncertain: three times Robertians were chosen and might have taken the crown; three times they deemed it more expedient to favour the restoration of the Carolingians, or more advantageous to have the power without the title. Thus heredity was asserted in favour of Charles the Simple in 893, of Louis IV. in 936, of Lothair in 954, and of Louis V. in 986. The difficulty indeed was not the taking of the crown but the keeping of it when once taken. The dukes of France had rivals (notably Herbert of Vermandois), capable of crushing them by forming coalitions; and if the Robertians had the support of Normandy, the Carolingians had that of Germany. Moreover the support of the archbishop of Rheims, faithfully rendered to the Carolingians, gave to them more distinction than the bishop of Sens gave to the Robertians. Hence, until his death in 956, Hugh the Great (son of Robert, count of Paris, and grandson of Robert the Strong), was content to remain the "king-maker" of the Carolingians, even as Pippin's descendants had been of the Merovingian *rois fainéants*. But by waiting for the fruit to ripen, he almost lost the chance of gathering it. The Carolingians whom he had had elected—Louis IV. and Lothair—displayed a fresh energy and capacity. Was it the last flicker of a dying light, or the long-delayed return of their fortune? For 30 years none knew on which side the balance would dip; but on the death of Louis V. after a reign of only one year, the Assembly of Senlis eliminated from the succession, the rightful heir, Charles of Lorraine, and elected Hugh Capet, son of Hugh the Great. The final struggle followed. The conflict raged between Laon, the royal capital, and Rheims, the ecclesiastical capital. The one ensured the kingdom of France; the other the crown. Hugh Capet won the first in 985 and the second in 987; but the prestige of the Carolingians was still such that their fall seemed to presage the end of the world.

THE HOUSE OF CAPET

The same difficulties that confronted the last Carolingians confronted the first Capetians. They inherited all the strength and weakness of the feudal system. Their strength was their central situation in the kingdom—the Île de France. Their weakness was the possession of a very small domain surrounded on all sides: on the west by the county of Blois and the powerful duchy of Normandy; on the north and east by the counties of Flanders and Champagne and by the duchy of Burgundy. Behind this little belt stretched provinces almost impenetrable to the royal authority—Brittany, Gascony, Toulouse, Aquitaine and the Spanish March. Thus the kings lay stifling in the midst of a feudal jungle which thrust itself up on their horizon and forced them to establish their power in the only two towns of any importance in their kingdom—Paris, the capital of the future, and Orleans, the city of learning. Their first responsibility was, therefore, to gain breathing-space, to give their energies to practical politics and, above all, to avert their eyes from that chimera of a restored empire which had ruined their predecessors. From 987 to 1060 they carefully avoided unequal combats in which they might have weakened their claim to those titles greater than any due to feudal rights, which they held in reserve for the future. Thus the beginnings of the Capetians gave less an impression of regeneration than of a prolongation of the decadence of the Carolingians.

Hugh Capet (987–996), thanks to his diplomacy rather than to

his military strength, contrived to maintain his independence despite the opposition of Charles of Lorraine (the last descendant of the Carolingians), the insubordination of the great lords and the hostility of a pope who favoured the empire. Above all, by associating his son, Robert the Pious (996–1031), with him in the royal power while he himself still lived, Hugh Capet secured the future of his dynasty by suspending the feudal right of election, an act of political sagacity that his grandson, Henry I. (1031–60) copied in 1059 in favour of his son, Philip I. But their system was still too like that of the Carolingians, and it became necessary to change it. Apart from their prudent opportunism, the greatest merit of the early Capetians was that they had sons, so that their dynasty endured without disastrous minorities and quarrels over partitions of territory.

Philip I. (1060–1108) accomplished nothing during his long reign of 48 years beyond the essential son and heir, Louis the Fat. Absorbed entirely in material pleasures and in love of money, he remained a total stranger to the great events of the second half of the 11th century. The conquest of England in 1066 by William of Normandy was begun while he was a minor and could do nothing to prevent it, but for the moment it diminished the pressure of Normandy upon his kingdom. The first crusade was preached in 1096 by a French pope, Urban II. Philip played no part in it; but indirectly the monarchy benefited, for while it increased the prestige of France in the East, it also weakened the power of the feudal lords who either perished in or were ruined by it.

Louis VI., the Fat (1108–37).—After a century of lethargy, the Capetian power awoke again under Louis the Fat, who concentrated his energy on extending his territory and rendering it obedient. The summit of his ambition was effectively to establish the king's highway from Paris to Orleans, and during 34 years of war he purged his domain of feudal brigandage. To become master in his own house he allied himself to a communal movement in Amiens against his rival Enguerrand de Coucy, but—sublimely an opportunist—he suppressed a similar movement in Laon because of the connection with it of his enemy Thomas de Marle. If he refused to admit feudal principles in his own affairs, or to his own disadvantage, he invoked them quickly enough against the great feudal lords, who were more powerful than he. Little more than a mere police officer, he had the Church on his side, but he did not allow it to dominate his actions. His principal minister, Suger, began as a simple monk; he became abbot of St. Denis. His other officials were all unimportant people, trustworthy and dependent on him. Thus, when the emperor of Germany, Henry V., sought to invade the kingdom in 1125, he soon fell back before the united strength of the vassals and townsfolk rallied under the oriflamme of St. Denis. The moral unity of the land had become a political factor.

Louis VII. (1137–80).—His successor, Louis VII., almost destroyed his work at the very moment when circumstances were conspiring in his favour. The two powers of greatest danger to his kingdom—England and Germany—were rent by civil distractions and disputed successions. His marriage, on the other hand, with Eleanor, heiress of the duchy of Aquitaine, had increased the area of his kingdom fivefold. Suger, his father's minister, continued to give him the support of his wise and moderate counsel, but unhappily, the second crusade, undertaken despite his warnings and the doubts of the pope, inaugurated a series of magnificent but fruitless exploits. Quarrels with his wife were even more disastrous, and the death of Suger in 1151 deprived Louis VII. of his wisest counsellor at the moment when his divorce was seriously compromising the fortunes of the Capetians. Two months after their separation Eleanor found a youthful candidate for her rich dowry in Henry of Anjou who thus added to his county of Anjou and his duchy of Normandy, the whole south-west of France. Two years later he obtained the crown of England (1154). Henry and Louis at once began the struggle between England and France which lasted till the middle ages were almost ended. Wedged in between the Angevin power and the German emperor, Frederick Barbarossa, it was little less than a miracle that the French dynasty escaped extinction. Twice the Church saved her devoted son

by the moral prestige given him by the presence in France of a refugee pope, and by the interdict which was placed on Henry II. after the assassination of Becket. Happily, after 27 years of childless wedlock, the birth in 1165 of Philip Augustus saved the kingdom from a war of succession.

Philip Augustus (1180-1223).—The new king had already given proofs of his cool energy and calculating ambition before his 20th birthday. Having vanquished the smaller principalities, he turned to overthrow or assimilate the greater ones. In five years (1180-86) he freed himself from the Flemish tutelage of Philip of Alsace and from that of the counts of Champagne. But the essential thing was the destruction of the Angevin empire. The battle was a long one. Abandoned by his sons Henry II. in the moment of death was brought to submission, but Philip Augustus found himself confronted by a new English king, his former ally, Richard Coeur de Lion. If he accompanied him to the crusade, he did so less from a desire to go than from a wish to return. His one interest was Richard's kingdom, and the absence of his rival seemed to him to afford an opportunity to despoil it. It was a foretaste of the duel between Louis XI. and Charles the Bold, and it took the same course. When Richard was captured in Germany on returning from his crusade Philip allied himself with Richard's brother, John, and they tried to bribe the emperor, Henry VI., to keep Richard a captive; but Richard bought his liberty, and the "devil at large" cost Philip all the fruits of his intrigues and shut him off from Normandy by the strong fortress of Château Gaillard. Happily the arrow that carried off Richard at the siege of Chalus, and the misfortunes of his brother and successor, John, restored success to the Capetians. Philip seized Normandy; then Anjou, Touraine, Maine and Poitou fell into his hands, but he failed to conquer the south-west. Fortunately for the future of his dynasty, Philip, instead of seeking to conquer England, adopted the true Capetian policy and marched against the allies of John in the north-east, the counts of Boulogne and of Flanders. The power of the Capetians had very definitely become dangerous, and a European coalition was formed to combat it. The king of England, the emperor Otto, and all the great lords of Flanders, Belgium and Lorraine allied themselves together. But the whole country responded to the call of Philip Augustus to repulse a feudal reaction allied with foreign intervention. The national victory at Bouvines (1214) placed the Capetians in an unrivalled position. The sole remaining task was to destroy the feudalism existing in Languedoc. Anxious not to risk his gains, but desirous rather of consolidating them by organization, Philip left to others the toil and trouble of conquests, the advantages of which were not for them. When his son Louis wished to wrest the crown of England from John, then fighting with his barons, Philip intervened without appearing to do so, supporting and disavowing his son by turns. Again when the Church and the needy and fanatical nobility of northern and central France destroyed the feudal dynasty Toulouse, and the rich civilization of the south in the Albigensian crusade, Philip took no part in order to avoid the odium that attached itself to this act of bloody oppression: but it was for him that Simon de Montfort, although he knew it not, conquered Languedoc. Henceforth, except for the English power in Gascony, there was but one royal France embracing the whole kingdom.

As in war, so in peace, Philip Augustus was an efficient sovereign. If he did not love feudalism, he liked theocracy no better—as is evidenced by his quarrels with Innocent III. He allied himself to the Church on the condition that she was complacent to his designs. He took advantage of her weakness in the midst of a violent age and gave to her the protection of the royal power even in lands beyond his authority. In setting the feudal lords against each other, the king and the Church found a common advantage. In furthering his anti-feudal policy Philip similarly exploited the wish for security and the instinct of independence among the townspeople who were demanding henceforth an assured position in the feudal hierarchy. By means of the communes (*q.v.*) he was able to make a breach in feudalism and to exercise his royal authority far beyond his own demesne. He did yet more: he gave to the monarchy instruments of government of which it

was still in need; at Paris, a council of men of humble birth, but wise and loyal; in his domains, bailiffs or seneschals, all-powerful against the great nobles, but submissive to himself; a treasury filled by the harsh exploitation of private wealth; an army that was no longer a temporary feudal levy, but a permanent royal force; and, finally, a fixed capital where the university sprang up about the towers of Notre Dame. So strong had the monarchy become that the son of Philip Augustus was the first of the Capetians who was not consecrated in his father's lifetime.

Louis VIII. (1223-26).—Louis VIII. continued his father's work by the acquisition of Poitou from Henry III. of England and of Languedoc from the Albigenses. In distributing great appanages among his sons he avoided family quarrels such as had brought Henry II. of England to submission, and he facilitated unity by encouraging French customs in the more distant parts of the kingdom. But he lacked the time to reveal his capacity, for he died suddenly in 1226, leaving a foreign wife and infant son, the future Louis IX. behind him. Blanche of Castille assumed the regency and undertook the guardianship of her son, and for nine years she ruled with a strength of character and a farsightedness that frustrated her enemies who had hoped to take their revenge for Bouvines. In 1227 and in 1229 by the treaty of Meaux, she prevented the feudal barons of the east from aiding those of the west who were threatened by Henry III. of England, and she assured the annexation of Languedoc at the same time as, by the marriage of her son with the heiress of Provence, she finally broke the ties that held that country to the German empire.

Louis IX. (1226-70).—But her greatest work was the education of her son. She imbued him with that high morality that inspired not only his private life but the whole conception of kingship to which he remained faithful. In Louis IX. morality, for the first time, entered the domain of politics; his sole aim was the good of the whole world and the reconciliation of all Christians in the name of a general crusade. Not that Louis IX. was a monk. Well-balanced, he inherited and exhibited the qualities of his house—courage, skill and commonsense; but he added to these a new element—religious fervour, the spirit of Christ. Sometimes, indeed, he was forced to fight, as when the small nobility of the centre of France rebelled under the leadership of Trancavel, viscount of Carcassonne, or when Henry III. of England sought to maintain the English hold on Poitou. After the two victories of Taillebourg and Saintes (1242) Louis imposed terms on Henry III. Then he left for his first crusade in Egypt, which was to end disastrously. Louis indeed preferred negotiations to battles. On his return from Egypt, in the Treaty of Corveil (1258), he concluded with the king of Aragon an agreement which left in his hands the whole country to the south of Roussillon and the Pyrenees, and assured to France, all territory north of the Pyrenees. By the treaty of 1259 with Henry III. in exchange for the recognition of the conquests of Philip Augustus, Louis agreed to return those of his father, Louis VIII.—an example unique in history of a victorious monarch acting solely in the interests of justice and peace. He won for himself and his kingdom a moral authority that made of him a universal arbiter: the oak of Vincennes under which, as it is said, he delighted to administer justice, cast its shade over all his policy. Thus peace was established among the princes, and justice decided no longer by battle, but by law. He intervened in the interests of serfs; he granted privileges to townspeople; and in the famous *Livre des Métiers*, was founded the first statute of a social order organized on Christian principles. Having accomplished all this and, notwithstanding his former failure, against the advice of his mother and his counsellors and even of the pope himself, Louis IX. embarked on the crusade to Tunis in which he met his death on Aug. 25, 1270.

Philip the Bold (1270-85).—His son and successor, Philip III. departed from the wise traditions of Capetian policy. The death of Alfonso of Poitiers in the expedition to Tunis meant that as well as the crown of France, Philip inherited Toulouse, Poitou, Auvergne, and the marquisate of Provence. The death of the king of Navarre and count of Champagne and Brie (*q.v.*) in 1273 left his heir a girl of 3 in Philip's hands. Champagne and Brie were annexed to the crown and a marriage between the heiress and the

king's second son (Philip, later Philip IV.) arranged. These successes and the temporary success of Charles of Anjou (*q.v.*) in southern Italy encouraged Philip to look outside the boundaries of France for conquests. But the Sicilian Vespers (*q.v.*) ended the hopes of Charles of Anjou in Italy in 1282 and Philip's attempt to win the crown of Aragon for his son failed in 1285. Philip III. died on his return. It was time for a commonsense ruler to make an end to these distant adventures for which the France of that day was not ready.

Philip the Fair (1285-1314).—The new king, by methods completely opposite to those of St. Louis, won for his kingdom a pre-eminent position in Europe. His policy was simple. He sought to bring feudalism and the papacy into subjection to the monarchy by means of a more and more centralized administration. In his realism and his prudent ambition, and still more in his method of government, Philip was a man of the modern world. With him the French monarchy formulated its ambitions and changed by degrees its feudal and ecclesiastical character for a legal constitution. His progressive and aggressive policy and his ruthless financial legislation were carried out by those lawyers of Normandy, or the south, who had been brought up in the school of Roman law, in the universities of Bologna and of Montpellier, raising themselves little by little to the political stage, and who were now leading the king and filling his *parlement*. It was no longer on religion or on morals, but on imperial and Roman law, that the *chevaliers à lois* based the omnipotence of the ruler. Nothing indicates more clearly the new tradition which was growing up than this fact—all the great events in the reign of Philip the Fair were given at any rate the appearance of legal process. The first of these was with the papacy. The famous quarrel between papacy and empire had ended in the victory of the former. A new quarrel was opened by Boniface VIII. with the kings of France and England. As vicar of Christ, the pope insisted that the temporal princes should render him the same obedience as they owed to God—an obedience not only spiritual, but temporal. And thus, in effect, they laid claim to the benefices of all Christendom and refused to admit that any king could demand tithes from the clergy without the consent of the pope. The quarrel began in 1294. The bull *Clericis laicos* definitely forbade the clergy to pay taxes to the lay power. The king, whose expenses had increased with his conquests, and who had no revenues beyond those derived from his domains, was always short of money. The feudal lords, ruined by the crusades, and the lower classes, fleeced by every one, could give but little. As in all times of crisis, Philip forbade the export of gold or silver from the kingdom. Thus deprived of his revenues from the French clergy, Boniface protested in vain. Philip's expenses were constantly increasing and he took violent measures to improve his financial position. Everyone who had dealings with him resented the constant attempts to raise money by tampering with the coinage. He both issued bad money and ordered by proclamation the value that should be put on it. Papal pretensions to interference in any matters that touched Philip's financial or political position could not be borne by the king and he used the meeting of National representatives, the States-General, to support the national cause against the pope. In a meeting in 1302 protests against papal oppression were made. Boniface determined to win the support of a council against Philip, whose ministers replied with a display of freedom of thought that was centuries in advance of the age. Nogaret travelled to Anagni, where he seized the person of Boniface with the object of bringing him, in his turn, before a council. A month later the pope became insane, and died: the Capetians had conquered where the Hohenstaufen had failed. The Roman theocracy, which had thought to see its dream realized in the jubilee of 1300, found itself confronted by the captivity of the papacy at Avignon, the internecine quarrels of the Great Schism, the vain efforts of councils for reform, and, before a century had passed by, the sweeping and heretical solutions of Wycliffe and Hus.

The affair of the Templars, also a matter of money, was another legal process carried out by Nogaret. As a military and religious order, the Templars had no longer any *raison d'être*; further, the order had the misfortune to be international and to have sided with Boniface, but its greatest crime was its wealth—

for great financial powers become speedily unpopular: the Jews and the Lombards had already aroused popular dislike and envy. Philip made use of this hatred among the people, and also of the weakness of his creature, Pope Clement V. The trial of the order, though disguised under the imposing names of religion and morality, was in truth a political affair (1307-13); and this astonishing conclusion to the crusades resulted in a vast scheme of secularization that was the precursor of those in the 16th and 18th centuries.

Philip's foreign policy had the same litigious character. He instituted suits against his natural enemies—the duke of Guienne (king of England) and the count of Flanders, the former as powerful as his suzerain, and the latter at once the vassal of two rival sovereigns, the king of France and the emperor of Germany. Philip began his reign by settling the Sicilian and Aragonese adventures that he had inherited from his father. Then he seized upon a quarrel between English and French sailors to institute his customary legal procedure: a citation of the king of England before the *parlement* of Paris, and in case of default, a forfeiture to be followed by execution, that is to say, by the seizure of Guienne (1295). A truce brought about through the mediation of Boniface VIII. restored Guienne to Edward I., gave him Philip's sister as wife, and promised him the hand of Philip's daughter for his son (1298).

By a still more prolonged and unhappy law-suit Philip sought to incorporate Flanders within his kingdom (1297-1312). Guy de Dampierre, who was lord of the country, had desired to marry his daughter to the eldest son of Edward I. without the permission of his suzerain. Arrested and imprisoned in the Louvre, he was forced to deliver up Flanders (1297); but when Jacques de Châtillon attempted in the king's name to take possession, he found himself confronted by a rising of powerful counts and of turbulent and haughty republics of merchants and weavers, who had need of English wool for weaving the cloth that was the staple product of the land. The Flemish infantry overthrew the chivalry of France at Courtrai (1302) in a battle that heralded the disasters of the Hundred Years' War (*q.v.*). By the Treaty of Athis-sur-Orge (1305), which was a veritable masterpiece of chicanery, this luckless venture for France was momentarily settled. Philip secured the French-speaking towns of Lille, Douai and Valenciennes, but Flanders remained independent.

The efforts of Philip the Fair to expand his territory eastwards met with greater success. His marriage had brought him one of the five great French fiefs—Champagne with Brie. Hard cash enabled him to extend his influence over the county of Chartres, Bar, the Lorraine bishoprics and Franche-Comté and to acquire Lyons and the Vivarais. Thus he removed the threat of encirclement which had been the preoccupation of the early Capetians. Disdaining the dream of imperial honours that haunted the mind of his brother and the lawyers, he turned all his energies towards the eastern frontier, the line of least resistance, which might have yielded had it not been for his death at the age of 46 (1314) and for the Hundred Years' War.

The Sons of Philip the Fair, 1314-1328.—His three sons continued his work. Louis X. mastered the feudal reaction provoked in 1314 by the terrorist methods of his father's jurists. But in order to save the administrative and political gains of his predecessors, he was compelled to sacrifice Enguerrand de Marigny, his minister of finance, to the mob fury roused by taxation as severe as it was necessary. Philip V. succeeded to the throne because Louis had only a daughter, and Charles IV. followed Philip V. for the same reason, for it was impossible to permit France to be brought as a dowry to a strange prince. This precedent came to be known as the Salic Law, yet it amounted to nothing more than the feudal rule that the whole domain returned to the crown in default of a male heir. Under these eventless reigns, and thanks also to troubles in Germany and England, the development of the kingdom went on apace. In particular, under that born organizer, Philip V., the administration was improved by the development of the judicial and financial departments out of the *conseil du roi*. But with these kings the male line of Hugh Capet at last failed. For three centuries and a half they had laboured greatly in founding a kingdom, a kingship, and administrative institutions. Under

BY COURTESY OF KENNEDY AND COMPANY

THE CATHEDRAL CITY OF CHARTRES

An etching, by John Taylor Arms, of Chartres, on the river Eure (Department of Eure-et-Loir), France. The town is famous for its 12th century cathedral, one of the finest examples of the French Gothic style, which is seen here from the south-east, across the red-tiled roofs of the houses on the river bank

Hugh Capet in 987 the territory of France was scarcely as great as two French departments of the present day; by 1328 it was equal in extent to 59 departments. The political unity of the kingdom was no longer impeded by some 15 great seignorial districts, but by four isolated fiefs: Flanders in the north, Brittany in the west, Burgundy in the east and Guienne in the south. For a long time unsettled, the capital was now established in the Louvre, which had been fortified by Philip Augustus. Like the fiefs, feudalism had been broken into pieces. The Capetians, though not of royal origin, had known how to create around them an administrative system in order to achieve order and centralization—the royal treasury of the Louvre; the *chambre des comptes*; the *parlement* dealing out a justice common to the whole realm; a royal currency; local representatives, provosts, bailiffs or seneschals. Two adversaries alone might have been dangerous; but one, the Church, was now a captive in Avignon, and the second, the people, although they protested strongly against the taxes, had greatly prospered (if one may judge from the great booty captured by the English) and were consenting to efface themselves in the States-General behind the royal will. This well-established authority was also aided by the memory of Saint Louis, and it was through the strength of this ideal that the royal prerogative survived the Hundred Years' War in the course of which a unified monarchy arose and feudalism met its death.

THE VALOIS

With the extinction of the direct line of the House of Capet, the crown passed to a cadet branch, the Valois. From 1328 to 1498, seven kings, the inferiors of the Capetians in commonsense and in political sagacity, with the exception of Charles V. and Louis XI., lost for France the pre-eminent position she had gained over all other states. During this period France passed through two grave crises, the Hundred Years' War which imperilled the very existence of the kingdom, and, under Louis XI., the contest with Burgundy which threatened the territorial unity of the monarchy that had been so laboriously builded amidst the ruins of feudalism. On the death of Charles the Fair, the late king's cousin, Philip of Valois became king as Philip VI. No one seriously thought of pressing the claim of the English king, Edward III. grandson of Philip the Fair, least of all Edward himself. The Hundred Years' War which soon began was aggravated rather than caused by the existence of this English claim.

The Hundred Years' War.—The war falls into two sections: the first from 1337 to 1378, the second from 1413 to 1453, periods separated by 35 years of mistakes and miseries. From a feudal dispute between a suzerain and his vassal it quickly developed into a great political and economic conflict. Since the time of Philip the Fair the real quarrel had turned upon the question of Flanders. Industrious, rich, jealous of their freedom, barely tolerating the yoke of their count and his suzerain, the king of France, the Flemish communes suffered at Cassel (1325) the revenge for their victory at Courtrai. Moreover, Philip repaid the hospitality shown by Edward III. to his brother-in-law, Robert of Artois, with the seizure of Guienne. To attack the English in Guienne and Flanders was to hurt their most vital interests—the cloth and wine trades. English merchants sold wool in Bruges and bought wine in Bordeaux; Edward III., therefore, forbade the exportation of wool and threatened to transfer the manufacture of cloth to England. The industrial towns of Flanders were reduced to idleness, and on the advice of Jacob van Artevelde (*q.v.*), a rich woollen merchant of Ghent, threw themselves into the arms of Edward III. Their final hesitations disappeared when, on the advice of Robert of Artois and Artevelde, Edward claimed the crown of France (1337).

The war opened with a French naval disaster when the French fleet, which had been neglected for years, was destroyed at the battle of Sluys (1340). The sea was thus closed to France, but the war continued spasmodically on land. Flanders was overrun after the murder of Artevelde (1345). A war of succession broke out in Brittany between John de Montfort and Charles of Blois, the nephew of Philip VI. Edward naturally supported de Montfort and war went on in Brittany. The capture of de Montfort

did not end the struggle. Edward, setting out with a large army, exceptionally well provided with archers and including a small train of artillery, turned aside at the suggestion of a French exile, Harcourt, to land in the Cotentin and ravage the defenseless Normandy. He raided almost up to Paris itself and turned northwards to join his ships, and so avoid a pitched battle while securing his booty. Followed and overtaken at Crécy, Edward achieved a complete victory over the French (April 26, 1346). The subsequent capture of Calais (1347) afforded him a permanent gateway into France. These military disasters were followed by the Black Death, and Edward forebore to press his advantage, partly from prudence and partly because of the heavy cost. Before he died in 1350 Philip VI. at least had the good fortune to add Montpellier and Dauphiné to his domain—the future appanage of the eldest son of the French kings.

John the Good (1350–64).—Philip's son, John the Good, has commonly been reproached for his extravagance, romantic restlessness, brutality and recklessness. In truth, however, on ascending the throne, he found treason surrounding him on all sides—first Harcourt, next the constable d'Eu, and then, in his own immediate family, Charles the Bad, of Navarre. He crushed the traitors, but in default of any sufficient revenue, was driven, like Philip IV., to abuse his right of coinage. He spent money recklessly to win over Charles the Bad, who had betrayed him. As soon as Charles was imprisoned in Château Gaillard, his followers deserted openly to England and the war began again. Edward III. needed money as badly as John the Good. Wealthy by reason of her commerce and her industry, England could borrow from the Florentine bankers under the security of a monopoly upon wool. But in France, which was solely an agricultural country, recourse could only be made to the inadequate and dangerous expedients of confiscation, debasement of the currency, and arbitrary taxation. Regularly levied taxes could alone fill the treasury. In Nov. 1355 John summoned the States-General which voted him "aids" on condition that they should be levied upon all classes and that their collection and application should be regulated by definite guarantees. The principle was a good one and resulted in the setting up in France of representative institutions analogous to those which were already established in England; the Estates, however, were no more fortunate than had been the monarchy in inducing the taxpayers to pay their impositions. Thus it was that John came to fight and be captured at Poitiers (1356) with a well-nigh empty treasury and with troops no better equipped nor disciplined than those which had been defeated at Crécy. Revolution followed. Confronted by a dauphin who was not yet of age, and amidst the ruins of a discredited council, the States-General reassembled and, at the instance of Robert Lecoq, bishop of Laon, and of Etienne Marcel, provost of the merchants of Paris, the leaders of the Parisian representatives, refused to co-operate with the dauphin's counsellors and determined to take him under their own tutelage. But politics at once took the place of considerations for the public weal, and they demanded the release of Charles the Bad. The dauphin hesitated; but, threatened with a rising, was forced to give way. In Feb. 1357, the States-General reassembled and transformed themselves, by means of the Grand Ordinance, into a deliberative, independent and permanent assembly. The government, at first seized by the middle classes, was soon under the revolutionaries led by Etienne Marcel; but the support of a name and a cause was imperative. This he obtained through the *coup de main* which liberated Charles the Bad. But the murder of the marshals of Champagne and Normandy under the eyes of the dauphin (Feb. 22, 1358), and the consequent flight of the latter, provoked in the noblesse and the States-General at Compiègne, a strong loyalist reaction. At the same time the burghers in the barricaded capital, shocked at these crimes, deserted the reformers with their foreign allies. Neither the peasant rising of the Jacquerie, which was crushed at Meaux, nor a last, but unheeded, appeal to the towns, nor the uncertain alliance of Charles the Bad, whom he offered to make king of France, availed to save Marcel from death at the hands of the royalist party in Paris (July 31, 1358). As a consequence of the reaction that followed his death, the Crown inherited the financial administration which the States-General had erected as a protection against its extra-

gance. Instead of being the representatives of the Estates the *élus* and superintendents became officials like the *bailiffs* and provosts. Taxes, such as the hearth tax and the tax on salt, voted provisionally to meet the expense of war, were levied throughout the entire reign of Charles V. and were added to his personal revenues. The opportunity to found political liberty on the right to grant and control taxation was lost.

Treaty of Brétigny.—Besides the re-establishment of order in Paris, it was important to put an end to the wars with England and Navarre. This was done in the Treaty of Brétigny by which (1360) king John ceded a third of his kingdom to Edward III.; but in the final draft, the French king retained the sovereignty of the lands. John further obtained his liberty at the price of the enormous sum of three million gold crowns, which he was never able to pay in full, and he returned to his pleasant captivity in England, where he died in 1364. But in her suffering and sorrow France was gradually realizing herself. Vanquished, she felt far more strongly than her king the shame of defeat. Local patriotism, like municipal patriotism, grew up in the peasants as in the burghers, and in a common hatred of the English was gradually founded a national feeling.

Charles V. (1364-80).—The Treaty of Brétigny, however, did not bring peace to the kingdom. For ten years the stragglers of the English, Navarrese and Breton armies, banded together in what were known as the Great Companies, ravaged France till Charles V., *durement subtil et sage*, succeeded in sweeping them away. He persuaded their chiefs to lead them off wherever there was any fighting to be done—to Alsace, Brittany, Spain. With the help of du Guesclin, a Breton adventurer of military genius, who became constable of France, some were trained to form an army to fight the English when war should be renewed. At the same time Charles fortified the towns and cities. A great diplomat, he made it his object to nullify the Treaty of Brétigny by alliances with Flanders, the heiress of which he married to his brother Philip, duke of Burgundy; with Ferdinand of Portugal and with the Emperor Charles IV. His alliance with Henry of Trastámara, the usurping king of Castile, was an inducement to the Black Prince to support the exiled Peter the Cruel. Debts incurred in Spain forced the Black Prince to try to raise money from his lands in France; the Gascon lords therefore appealed to Charles V. Summoned to appear before the courts in Paris, the Black Prince failed to obey, and war was renewed in Gascony, Poitiers and Normandy. But this time (1369) different tactics were used. As the English still held to the employment of great masses of cavalry, Charles gave orders that the towns were to be defended and that the enemy was to be harried without risking a general engagement. Thanks to the prudent Constable du Guesclin and the admiral Jean de Vienne, Charles was able, sitting quietly at home, to win back, bit by bit, all that his predecessors had rashly lost on the field of battle. When he died in 1380 the English possessions in France were reduced to Bayonne, Bordeaux, Brest, Cherbourg and Calais.

Charles VI. (1380-1422).—The death of Charles V. and the dynastic quarrels in England brought the war with that country to a close, but inaugurated a civil strife that lasted 35 years. The late king's brothers at once fell to fighting for the regency of Charles VI., a child of 12, and in the place of a strong central power there arose a republic of princes divided among themselves and wholly concerned for their personal interests. The faithful and wise counsellors of Charles V., whom the princes derisively called the "Marmousets," were removed, and the bad government of the king's uncles aroused widespread and increasing discontent. When they claimed to levy the *aides* which Charles V. had renounced on his death-bed, the populace of Paris, armed with mallets, sought to murder the tax-collectors. The great towns followed the example set by Paris and the Jacquerie was renewed in Auvergne and the Vivarais; but the battle of Roosebeke (1382) won by a French army over Flemish burgesses reacted on the situation in France, and the forces of feudalism and of monarchy triumphed.

When he came of age, Charles VI. recalled his father's counsellors to power, and in two months they restored order. But

they could not control the king's pleasures, nor his extravagance, and when he became insane their rule came to an abrupt end (Aug. 5, 1392). Once more the king's uncles assumed the government, but instead of lessening the evil consequences of the king's insanity, they aggravated them.

War Between Burgundians and Armagnacs.—This time the combat was fought between two branches of the royal house—Orleans and Burgundy. Philip the Bold, duke of Burgundy, uncle of the king, had over his rival, Louis of Orleans, the king's brother, the advantages of superior age, of alliances with England and Germany, of wealth and great territorial possessions. The two opponents did not represent two different political programmes: what each sought was to be the master of the intermittently insane Charles VI., in order to exclude his rival from the pillage of the royal treasury. The contest became still more bitter when John the Fearless succeeded to the dukedom of Burgundy in 1404. Up to this time the queen, Isabella of Bavaria, had been held in a sort of dependence by Philip of Burgundy, who had brought about her marriage to Charles VI. Less desirous of power than of money, she suddenly became favourable to the side of the duke of Orleans. Whether it was passion or policy, it cost the duke his life, for John the Fearless had him assassinated (1407) and thus set loose against each other the parties known as the Burgundians and Armagnacs, the latter so called because the son of the murdered duke, Charles of Orleans, was the son-in-law of the count of Armagnac (*q.v.*). Despite all efforts to effect a reconciliation, the whole country divided itself into two camps, the south and west supporting the Armagnacs and the north and east the Burgundians. Paris, with her tradesmen—above all the butchers—and her university, played a prominent part in the quarrel, for to be master of Paris was to be master of the king. In 1413, owing to the rising of the *Cabochiens* (the butchers led by Simon Caboché), the duke of Burgundy gained the upper hand. Out of this new and daring combination of brute force and idealism sprang the famous *Ordonnance Cabochienne*, a practical programme of financial reform. Unhappily the time was lacking in which to give it effect, nor were the actions of its authors in accord with the spirit of the ordinance. The Government was at the mercy of the mob which was itself terrorized by turbulent and incapable leaders. The conflict ended in a war of factions between the carpenters under Cirasse and the butchers under Caboché. John the Fearless fled from Paris, and the Armagnacs entered the city in his rear; from Dec. 12, 1413, until July 28, 1414, the white terror took the place of the red. These disorders allowed Henry V. of England to resume the offensive.

War with England: Agincourt.—A national disaster was the reward of these internecine feuds. At Agincourt (1415), as at Crécy and Poitiers, the chivalry of France was shown to be incapable of playing the soldier in real warfare. Charles of Orleans was taken prisoner and John the Fearless, who had held aloof from war set out to return to Paris. The Armagnacs were discredited by defeat, but the duke of Burgundy did not take advantage of the situation.

An unnatural alliance between Burgundy and the queen led to a renewal of civil war, and Henry V., seizing his chance, occupied Normandy and in two years destroyed the work of Philip Augustus. No serious resistance was anywhere offered and the common need urged the duke of Burgundy to seek alliance with the Armagnacs, in whose hands was the heir to the throne, the dauphin Charles. But the assassination of John the Fearless at the conference at Montreuil in 1419 by members of the dauphin's household was a fatal mistake; the whole Burgundian party, with them the queen, made a close alliance with the English. This treacherous assassination gave renewed life to the feuds which were showing signs of dying a natural death in face of foreign invasion. By the Treaty of Troyes (1420) Henry V., who was to marry Catherine, daughter of Charles VI., was recognized as heir to the French throne instead of the dauphin Charles. When Henry V. and Charles VI. died in 1422, Henry VI., with the aid of the new duke of Burgundy, Philip the Good, was proclaimed in Paris as king of France and England. In 1428 the English held the whole of northern and eastern France as far as the Loire,

and the two chief institutions in the land—the university and the *parlement* of Paris—acknowledged the English king.

Charles VII. (1422-61).—But the greatest weakness of the French was again the king himself, Charles VII., the “king of Bourges,” as he was commonly called. This youth of 19, born of a madman and a loose-living Bavarian princess, timorous and suspicious, was the symbol of France itself. After his victories of Cravant and Verneuil (1424) the duke of Bedford, regent for the young Henry VI., gave Charles a respite of four years. But Charles’s successive favourites, Giac and de la Trémouille, solely occupied in lining their own pockets, surrounded the king with intrigues. The banishment of the constable Richemont, the one forceful man about Charles, was secured and the unhappy king faced the tragic hour, when Orleans, the last bulwark of the south, besieged by the earl of Salisbury, was about to fall (1428). He had neither the desire nor the means of Philip VI. or John the Good to undertake reckless military expeditions to defend his country. A policy of withholding his hand from a vain display of military strength which might easily be broken had served Charles V. well, but Charles VII. had not his grandfather’s skill, nor was he acting on any well thought out plan.

Joan of Arc.—Help came to him from an unexpected quarter. The cruel, prolonged war had year by year stimulated the growth of a national feeling against the English. *La grande pitié qui était au royaume de France* was suddenly incarnated one day in the person of a young girl from Domrémy, in Lorraine, inspired with a stubborn faith and an exalted spirituality. The timid counsels of the army commanders, the not disinterested doubts of the courtiers, the criticism of experts and the questions of the doctors, she countered and overcame by her “voices.” They told her, she said, to raise the siege of Orleans and to lead the gentle dauphin to Rheims for his coronation. Her sublime folly was to prove itself wiser than all their wisdom. In two months (May-July 1429) she raised the siege of Orleans, destroyed the prestige of the English army at Patay, and brought the hesitating and spiritless king, in spite of himself, to his coronation at Rheims—an event that was to have an extraordinary political effect throughout France. Through her, Charles VII. was accepted without question as “the man to whom the kingdom of France ought to belong.” After Rheims the Maid’s first thought was of Paris and of completing the destruction of the English. A check outside Paris enabled the jealousy of la Trémouille to use the Maid for eight months in secondary operations until the day when, under the walls of Compiègne, she was captured by the Burgundians and sold by them to the English. She received a scrupulously fair trial, but was condemned by her own persistence, and was burnt alive at Rouen on May 30, 1431 (*see* JOAN OF ARC).

Her martyrdom paved the way for the realization of one of the Maid’s dearest wishes: the reconciliation of the warring parties in France. The English regent, Bedford, had with difficulty kept the Burgundian alliance. It was strained by the Duke of Gloucester’s marriage with Jacqueline of Hainault and the consequent quarrel between Burgundy and Gloucester. It was broken when on the death of his wife, Anne of Burgundy, Philip’s sister, Bedford married a vassal of Burgundy, Jacquette of Luxemburg. The overthrow of the favourite la Trémouille through the agency of the constable Richemont removed the last barrier to agreement. Hard though its terms were, the treaty of Arras enabled a united France to expel the English from the east and opened the way for the king’s return to Paris (1436). During the next three years, famine, plague, the atrocities of the *écarcheurs*, or flayers, and finally the aristocratic rising of the Praguerie completed the misery of the country. But during the truce with England, Charles VII. succeeded, with the aid of the brothers Bureau, in establishing the first permanent royal army (1445), and with that of Jacques Coeur (*q.v.*) in paying for it by means of a permanent tax (1449). But he repaid his servants with the same ingratitude he had shown towards Joan of Arc, whose fame he only rehabilitated in 1450. Meanwhile the English, weakened by the death of Bedford, continued to wage war unsuccessfully and to lose their possessions. Normandy dropped from their hands at Formigny (1450); Guienne, which had been

English since the 12th century, was lost at Castillon (1453). Calais alone remained to them, and now it was they who were ruled over by a madman, Henry VI. France emerged from the Hundred Years’ War victorious, but ruined and depopulated. Her patriotism, in the broadest sense, had been stimulated by the menace of dismemberment. But the victory was, above all, a victory for absolutism. The distracted nation, preferring established order to insecure liberty, was content to abandon all attempt to control the government, and to give itself up to the enjoyment of living in peace. The king and the nation, now more at one and trusting each other better, pursued a utilitarian and steady policy along lines set for them by the natural resources and extent of the kingdom. Thus, when England was engulfed in the Wars of the Roses, and the menace of the Habsburg Empire rose up behind the indeterminate frontiers on the east, Charles VII. turned towards Lorraine and Alsace. Toul and Verdun claimed his protection; but the opportunity had passed for annexing them without grave difficulty. On the other hand the appanages that under the Capets had guarded the unity of the kingdom, had given rise under the Valois to a new and powerful feudal baronage.

Louis XI. (1461-83).—A hard task awaited Louis XI. The greatest of the new feudal lords, imprudently called into being by his ancestors, were the dukes of Burgundy whose domains were being gradually built up into a compact middle state between France and Germany. The policy of successive dukes was to cement their somewhat inchoate territories; to keep a hold over such independent centres as the ecclesiastical principality of Liège; to encircle the monarchy with Burgundian dependants. The policy of Charles of Charolais, known as duke Charles the Bold, was definitely to encourage feudal anarchy: he said himself that instead of one king of France he would see six.

The new king was a man of very simple tastes, endowed with a restless and impatient imagination, with an easy good nature designed to inspire confidence, penurious for himself, but reckless of money when he hoped to win over men who were useful or dangerous, favouring diplomacy rather than the hazard of war. He had observed and comprehended the weaknesses of a Burgundy not yet a sovereign state, and too quickly aggrandized to be strong. But in his early years he made many mistakes. He was forced to struggle against the new Pragueries called Leagues of the Public Weal (presumably from their disregard of it). The adhesion of Burgundy gave solidity to this feudal combination. On three occasions (1465, 1467, 1472) his own brother, the duke of Berry, supported by the duke of Brittany, the count of Charolais, son of Philip the Good of Burgundy, who was now too feeble longer to dictate Burgundian policy, and the duke of Bourbon, sought to impose their authority upon him. That he triumphed was due rather to diplomacy than force of arms. After an indecisive battle at Montlhéry, near Paris, knowing that he had to deal with a coalition of marauders out for plunder, he gave way in everything in the treaties of Confians and of Saint Maur. His promises, however, cost him little since he had no intention of keeping them. In the course of the second league provoked by his recovery of Normandy, which he had promised to his brother in exchange for Berry, he found himself caught in his own trap. Venturing with an escort inadequate for protection to Péronne to try by his own persuasive powers to break the alliance between Charles of Burgundy and the dukes of Brittany and Berry he forgot that his agents were busy fomenting a rising against Burgundy in Liège. He had hardly reached Péronne when news arrived of the outbreak of the rebellion in Liège, at the instigation of Louis’ emissaries. Threatened by Charles with imprisonment, Louis had to promise to fulfil his engagements made at Confians and Saint Maur, to give Champagne to the duke of Berry, Charles’ ally, and to assist in person in the subjugation of the rebels of Liège (1468). Once again at liberty he hastened to annul the treaty of Péronne and to force his brother, the duke of Berry, to give up Champagne in return for distant Guienne. The duke’s death occurred opportunely at the moment when a third league was being formed with the object of placing him upon the throne. Charles the Bold, who wished to recapture the

towns on the Somme, bought by Louis from his father, was repulsed before Beauvais; the executioner made an end to the treasons of the smaller nobility.

It only remained to destroy the duke of Burgundy. "The universal spider," as he called Louis, sat spinning his web in the darkness, and was eventually able to entangle him in it. Louis secured Edward IV. of England at Picquigny by means of a subsidy, and united the duke of Lorraine and the Swiss against his rival. After the terrible defeats of Granson and Morat (1476) the Lorrainers destroyed the duke of Burgundy near Nancy (Jan. 5, 1477). A scramble for the spoils ensued. French provinces or imperial territories—Louis claimed them all. But in his violent haste he caused the heiress of Burgundy to throw herself, in despair, into the arms of Maximilian of Austria, when he might have annexed the whole inheritance by marrying her to the dauphin. The treaty of Arras (1482) gave him only Picardy, the Bourbonnais and Burgundy; while, through his error, the establishment of the Habsburgs in the Low Countries started the three centuries' rivalry between the Houses of France and Austria.

The Administration of Louis XI.—The political tendency which governed all Louis XI.'s foreign policy formed also the inspiration of his home Government. Against his authority, right alone was of no avail. Military and fiscal power, the two chief agents of domination at home and abroad, proved the basis of his policy. As to the nobility, his only thought was to humble them as his predecessors had done by multiplying the number of new creations. Rebels were subdued; the Church was held in a strict tutelage that was rendered more galling through the way in which Louis abrogated or affirmed the Pragmatic Sanction of 1438 to suit his fiscal needs or his Italian policy. He was dubbed the king of the common people; and he was certainly one of them in his simple manners, no less than in his simple pleasures and religion, which was limited to superstitious practices. But in the States-General of 1467 he revealed the same opposition to a democratic control of the revenues as he had shown to the privileges of the nobles. He inaugurated that rule of autocracy which was to increase in strength until the days of Louis XV. Louis XI. was the king of the bourgeoisie; true, he demanded much of them, but he repaid them by measures which made for the suppression of those above them, as the restraint of those beneath them. But the most faithful ally of Louis XI. was death. Saint-Pol, Nemours, Charles the Bold, the duke of Berry, his brother, old René of Anjou, and his nephew the duke of Maine, heir to great riches; death mowed them all down as though it were in his pay. One day, however, death came to his retreat at Plessis-les-Tours to demand his wages, and carried him off despite all his relics (Aug. 30, 1483).

Charles VIII. (1483-98).—The death of Louis was swiftly followed by the reaction that had threatened his work while he still lived. That this reaction was only partly successful was due to his eldest daughter, Anne, wife of Peter de Beaujeu, brother and heir of the duke of Bourbon. She had inherited her father's ability. Anne and her husband, guardians of Charles VIII., began by making concessions. Certain agents of Louis's were sacrificed to the anger of the *parlement* and lands were restored to hostile nobles, of whom the chief was the duke of Orléans, a son-in-law of Louis XI. They even authorized the States-General to meet at Tours (1484) and for the first time the country districts as well as the towns were represented in it. The royal party, however, succeeded in making the States-General reject the duke of Orleans' demand that he should be regent, and in packing the *conseil du roi* with their supporters. Once supplies had been voted, they could ignore such demands of the Estates as the control of taxation and the summons of a meeting of the States-General every two years. The malcontent party next attempted to obtain by revolt what the Estates had failed to secure. Thus began the "Mad War" (1485) in which the duke Francis II. of Brittany played the rôle of a Charles the Bold and in which the Lorrainers, the kings of Navarre and England and Maximilian of Austria, took part. This last sally of feudalism ended in what it sought to prevent—the marriage of Anne, the heiress of Brittany, to Charles VIII. (1491).

It only remained to consolidate the final victory of the Valois: the acquisition of Burgundy and of a Brittany that had ever been jealous of its independence. Suddenly, however, this policy seemed to be in danger of being abandoned and forgotten in the crazy ambition to assert the rights of the House of Anjou to Naples—an enterprise into which Charles VII. and Louis XI. had refused to be drawn. Obstinate, of mediocre ability, and with his head filled with the romances of chivalry, Charles VIII. responded to the appeal of the Italians. By this war he interrupted for a century and a half the national tradition which was not returned to until the accession of Henry II. The truth is that this policy of magnificence appealed to the people of France who sought an outlet after the dull years of Louis XI.'s reign. Charles began operations by returning Roussillon and the Cerdagne to Ferdinand of Aragon, and Artois and Franche-Comté to Maximilian of Austria; the first, acquisitions of Louis XI., the second, part of the Burgundian heritage. He also paid a large sum of money to Henry VII. of England to secure his neutrality. After these foolish transactions, the paladin marched throughout the length and breadth of Italy. If his journey was triumphal, his retreat was precipitate. Charles only just escaped utter disaster at Fornovo (July 6, 1495), owing to the first of those Italian Holy Leagues which, at the least sign of friction, were ready to turn against France. After these fruitless adventures he died, in 1498, without male issue.

Louis XII. (1498-1515).—He was succeeded by Louis, duke of Orleans, who married his widow, Anne of Brittany, and thereby retained Brittany for France. Along with his widow, he espoused his cousin's Italian policy. He did not hesitate to plunge further into this imbroglio that was so popular in France, since with glory it brought a rich booty. To the claims of Charles VIII. upon Naples Louis added his own upon the duchy of Milan derived from his grandmother, Valentina Visconti. Appealed to by Venice and supported by Cardinal d'Amboise, who wished to become pope, Louis wrested the Milanese from Ludovico Sforza in seven months (1500). His conquest endured for 14 years. Naples remained to be won. At first Louis agreed to a division of the kingdom between himself and Ferdinand of Aragon; but that crafty individual presently betrayed him and, notwithstanding the gallantry of Bayard, Naples was lost to the French for ever (1504). Pope Julius II. was responsible for a renewal of the Italian wars. Jealous of Venice, he stirred up France, the German empire and Spain against her in the League of Cambrai (1508). Once he had attained his object, he sought to drive out of Italy the "barbarians" he had himself brought in, and summoned Spain, Germany, the Swiss, Venice and even Henry VIII. of England to aid him against Louis XII. Gaston de Foix put an end to this Holy League by the crushing victory of Ravenna (1512) in which he himself lost his life; but, disheartened by the death, not only of de Foix, but also of his adviser, Cardinal d'Amboise, and beholding France threatened with an Anglo-German invasion, Louis XII. abandoned Milan, for which he had sacrificed everything, and died in 1515. His subjects, remembering only his careful government and the prosperity he had given to his kingdom, and forgetting the 17 years of war about which they had never been consulted, dignified his memory with the appellation of "Father of his People."

Francis I. (1515-47).—As Louis XII. had no sons the throne passed to his cousin and son-in-law, Francis, count of Angoulême, who along with the crown, inherited his predecessor's Italian ambitions. The epic victory of Marignano (Sept. 13, 1515) made him master of Milan. In return for the renunciation of Naples, he received from Spain in 1517 the restitution of French Navarre. The peace of Fribourg (1516) with the defeated Swiss, and the concordat of Bologna with Leo X. inaugurated a two-fold alliance that was to last as long as the monarchy itself. The deaths of Ferdinand the Catholic in 1516, and of the emperor Maximilian in 1519, and the election to the imperial throne of Charles of Austria against Francis I., opened up a field for adventure far greater than Italy. The rivalry of Charles V. and the king of France was to let loose imperialism throughout Europe for forty years (1519-59).

Everything conspired to make their enmity inevitable. Lord of the Austrian lands of the Habsburgs, of the territories of Charles the Bold and of Spain, Charles V. could not go from Spain into the Low Countries or Germany without encountering France. Italy was of special interest to him, for she was the key to the Mediterranean, and without her it was impossible to preserve communications with Trieste, Naples, Palermo, Barcelona or Valencia. But France was to Charles V. a geographical as well as a political obstacle. If his imperialism were victorious, France, threatened simultaneously on her northern, eastern and southern frontiers, would be stifled. From 1519 the Italian war ceased to be an expensive amusement for France, and became a matter of life and death. To the rivalry of policies was added that of persons. Francis was handsome, chivalrous and brave; the admired ruler of an aristocracy devoted to pleasure and to feats of arms, his court brilliantly united the ideals of chivalry with those of the Renaissance. Charles, on the other hand, was a less attractive figure; with his grave and hard temperament, his hesitating and calculating disposition, he was little affected by the intoxicating influence of the Latin genius. Each sought allies. Two presented themselves: the king of England who, not having abandoned the conquests of the Plantagenets, was able at any moment to checkmate Francis I., should the latter descend upon Italy; and the Pope who, seated between Milan and Naples, was invaluable to both but always feared the union of north and south. Assured of the support of Henry VIII., whom Francis had failed to win over at the Field of the Cloth of Gold (*q.v.*), Charles sought for allies within France itself; and the sole survivor of the great feudal lords conquered by Louis XI., the constable duke of Bourbon, agreed to play the traitor in return for a promise of the restoration in his favour of the ancient kingdom of Arles. Charles hesitated no longer. From 1521 he attacked Francis both in France itself and in Milan; he reached the summit of his fortune at Pavia (1525), where Francis I. was defeated, taken prisoner, and, after a year of galling captivity, compelled to agree to the crushing stipulations of the treaty of Madrid (1526). Happily France remained quiet and united; Burgundy expressed its desire to remain French, and the States-General, in their meeting at Cognac, denied the king the right to alienate a province of his kingdom. At this juncture, however, in return for two million gold crowns, Henry VIII., alarmed at the success of Charles V., changed sides; and all Italy, with the pope at its head, rallied to Francis. In a rage, Charles V. loosed upon Rome the mercenaries of the constable de Bourbon, who renewed the saturnalia of Alaric, but there met his death. Nevertheless, Charles was forced to sign the "Ladies' Peace" (1529) by which Francis kept Burgundy, but lost Italy; though in placing on his own head the iron crown of Lombardy, Charles proved that he had not abandoned his imperialistic designs.

In the following six years of recuperation (1529-35), Francis spared no effort in his own defence, and embarked on a new policy of balance of power. He did not scruple to bring within the same alliance the German Lutherans, Suleiman and his Turks, the heretic Henry VIII., and Clement VII. Diplomacy was more active than belligerency. The history of the years 1536-44 is that of truces made and broken, alliances formed and dissolved, reconciliations and imbroglios—the contradictions inseparable from a policy that crushed the Calvinists in France but supported the Lutherans in Germany, that sought the alliance of Clement VII. without any intention of breaking with Henry VIII., and asked the aid of Charles V. without renouncing the claims of France to Italy. Court intrigues between Madame d'Etampes, the imperious mistress of the aged Francis I., and Diane de Poitiers, who exerted great influence upon the dauphin, when combined with the constant changes in the personnel of the government and the lack of money that rendered all combinations ephemeral, further complicated the whole situation. Defeated at Cériseles in Piedmont, Charles V. carried the war with no better success into Provence and Champagne. At the outset his power was curbed by the Schmalkaldic League between the German Protestants, by the threat from the Turks to Vienna and Italy, and by the disastrous failure of his expedition to Algiers. Unable

to fight on three fronts at the same time, he concluded with France the peace of Crépy-en-Valois (1544), which confirmed the loss of Artois and Flanders and left Charles free to devote his attention to the Protestants and the Turks. The treaty of Ardres (1546) between Henry VIII. and Francis was little more than a new and heavy letter of credit drawn by Henry upon the French treasury.

Absolutism.—In 1547, Francis I. died. While in foreign affairs he had brought the doctrine of the balance of power within the sphere of practical politics, in home affairs he had strongly inclined the kingdom towards absolutism. He was the first king to rule *du bon plaisir*. To a temperament so brave and fiery, love and war were schools little calculated to teach moderation in government. Italy not only inspired him with the love of letters and art, she also provided him with an arsenal of despotic maxims; his true teachers, however, were the lawyers of the universities in the south. The great legal traditions of the days of Philip the Fair were revived in the hands of men like Duprat or Poyet, who worked successfully to distinguish the "greatness and super-excellence of the king" from the rest of the nation; to isolate the nobility amid the seductions of a court life full of pleasures and possibilities of favours and high places; and to win over the *bourgeoisie*, at first by bribery and afterwards by the hereditary transmission of office. Thanks to them, feudalism, in its landed interest, was smitten in the person of the constable de Bourbon, in its financial aspect by the execution of the superintendent Semblançay, while the special privileges of the provinces were countered by administrative centralization.

The master-stroke was the Concordat of 1516, which was a great step towards absolutism. While Germany and England sought remedies against the fiscal exploitation of the papacy in reforms of dogma or in schism, France thought she had found it in the Pragmatic Sanction of Bourges of 1438. The lawyers went still further. In giving to the king, by the Concordat, ecclesiastical patronage, they not only rendered the clergy a docile instrument, but they placed in the king's hands an inexhaustible reserve of wealth far greater than that which he obtained from the sale of offices. They transformed a necessitous and easily-controlled monarchy into an uncontrolled despotism. As a peace-offering, they restored to the pope the canon law and first-fruits; and thus succeeded in isolating the monarchy within the presumptuous pride of its omnipotence.

Henry II. (1547-59).—Master of the kingdom, Henry II. was never for an instant master of himself: he never succeeded in being other than a reflection, in his private life of the ambitious and greedy Diane de Poitiers, and in his political activities of Montmorency or the Guises. Under him the policy of the balance of power was pursued as heretofore. Charles V., who was seeking to convert an elective empire into a hereditary monarchy, everywhere encountered his opposition. Henry's ally, Suleiman, by his conquest of Hungary and mastery of the Mediterranean, menaced the Empire on the east. In Germany the protestant princes who had been defeated at Mühlberg (April 1547) obtained the assistance of Henry by means of the cession of Metz, Toul and Verdun (1551). To recover the princes, Charles was forced to sign the treaty of Passau (1552) and thereby to register the failure of his political ambitions by leaving to the empire its electoral character. At the same time he suffered a severe defeat before Metz (1553) at the hands of Francis of Guise. From that time, Fortune, who does not love old men, betrayed him. Despite the marriage of his son Philip with Mary Tudor, by which he gained the support of England (1554), despite the peace of Augsburg (1555), which pacified Germany by allowing the Lutheran princes to practice their religion undisturbed, Charles V. was defeated by Henry II. in the Low Countries, Montluc held him in check in central Italy, and—exhausted by illness and overwork—he abandoned Piedmont and the three bishoprics to Henry by the truce of Vaucelles (1556). After dividing up his territories between his son Philip and his brother Ferdinand, Charles abdicated the throne of Spain in Jan. and the imperial throne in Sept. 1556. For France this was a twofold victory. The renewal of the war by Henry, however, was a grave mistake. It was probably sug-

gested by the Guises who, since the victory at Metz, had been all-powerful at court and dreamt of obtaining Naples for themselves. Profiting by the absence in Naples of François de Guise Philibert of Savoy hurled himself into France by way of the Low Countries, the classic route of invasion, and overthrew the constable de Montmorency at St. Quentin (Aug. 1557), but Philip II. failed to take advantage of the victory. Recalled to France from Italy, the duke of Guise avenged the national honour by capturing Calais (Jan. 1558), which had been in English hands for two centuries.

The treaty of Cateau-Cambrésis (1559) finally put an end to the Italian follies. Naples, Milan, Piedmont and Savoy were lost to France. The loss of Savoy in particular was to leave a gap in the frontier for a century; but the possession of the three bishoprics of Toul, Verdun and Metz, and the re-capture of Calais, were symptomatic of a renewed effort towards making good the weak spots in the French armour. The treaty was not concluded before it was due, for the Reformation, during 38 years of fresh civil wars, was about to subordinate national interests to religious quarrels, and to bring France to the very edge of the abyss.

The Reformation.—Since the failure of the great councils of the 15th century, the cry "Reform! Reform!" had filled Christendom without awakening an echo. That Reformation (*q.v.*) which the popes would not carry through was carried through without their assistance. In France it did not possess at first a revolutionary character; it was not more than a belief arising out of traditional Gallican theories and the new humanism, and began as a protest at the decadence of the papacy and against mediaeval scholasticism among a small group of moderate and sagacious reformers centred at Meaux, around Lefèvre d'Étaples, and supported in opposition to the theological faculty of Paris by Marguerite de Navarre, the sister of Francis I. But neither the doctrine itself, nor persecutions, were sufficient to create a church and so a party. That was to be the work of the economic revival brought about by the great discoveries overseas. This revival had concentrated wealth in the hands of the middle classes, and, along with capitalism, all the other elements of power. The monarchy and the peasants had also benefited by it; after a century and a half of foreign wars and civil disturbances the former appeared the one and only power capable of maintaining order and unity, while the latter had taken advantage of the disappearance of the landed aristocracy—who would not work—and of the depreciation of the currency to regain possession of the land and to sell their produce more profitably. But there were two victims of this new order of things: the city proletariat, who were ever more oppressed by their employers, and the aristocracy bereft of its economic power and deprived day by day of its sovereign rights.

Thus the Reformation, the product of the educated classes, found its earliest supporters among the working classes of the 16th century. It was essentially an urban movement, although in the days of Francis I. and Henry II. it had already reached the country districts. From these artisans, labourers and small shopkeepers there were enough to create a martyrology, but not enough to found a party. For a long time the reformers respected the monarchy and its institutions, and, in accordance with the doctrine proclaimed by Calvin, suffered persecution for 40 years before they finally took up arms. It was not until the second half of the reign of Henry II. that Protestantism, having attained its religious evolution, became the watchword of a political party.

Gradually the party brought forward measures that grew ever more and more radical in character, and the peaceable citizens who composed its ranks were transformed into a military aristocracy which saw in the secularization of the ecclesiastical estates a remedy for the existing high cost of living. Coligny and Condé took the place of the timid Lefèvre d'Étaples and the harsh Calvin. Men succeeded to saints. Contrary to their tenets, the reformers became a political and religious party of an increasingly international character. The lance of Montgomery, by accidentally killing Henry II. (1559), gave the reformers a favourable opportunity. Henry left behind him four youthful and degenerate

sons. There followed a series of minorities and regencies—all causes of trouble in a kingdom that depended on centralization; all giving excuse, also, for the revival of the old feudalism, whose chief upholder, Antoine de Bourbon, king of Navarre, had reason to hope for the crown.

Catherine de' Medici.—Francis II. was never other than a sickly and nervous child governed by two women: his mother, Catherine de' Medici, and his wife, Mary, queen of Scots, niece of the Guises. Through her, Francis, duke of Guise, victor of Metz and Calais, gained control of the army and his brother, the cardinal of Lorraine, power over the king and the kingdom. To be excluded from power by the Guises, sprung from Lorraine and thus half foreigners, was infinitely exasperating to the princes of the blood—Antoine de Bourbon and his brother Condé. They sought a following among the discontented Calvinists and the disbanded officers of the armies that had fought in the Italian wars. Strengthened by the failure of the conspiracy of Amboise, which had been organized (1560) by Condé to overthrow them, the Guises took advantage of their victory to issue the edict of Romorantin. The chiefs of the reforming party, arrested at the States-General of Orleans, were in danger of their lives when the early death of Francis II. (Dec. 1560) ruined the Guises and saved Protestantism.

Charles IX. was also an invalid and a minor. Catherine de' Medici easily ousted the legal regent, Antoine de Bourbon, and for ten years kept her son in her own charge. Up to that time she had appeared to be no more than the retiring and self-sacrificing widow of Henry II. Subtle and full of maternal ambition, she had attained to power at the age of 41, in the midst of the hopes and fears aroused by the fall of the Guises and the return to power of the Bourbons. But she needed the support of a party. Indifferent in religious matters, she had a love of power, a characteristically Italian adroitness in intrigue, and a fine political sense. She was the first to understand in the interests of the royal authority that between the violence of Catholics and Calvinists lay the middle path of toleration. Her spokesman in the States-General at Orleans was the chancellor, Michel de l'Hôpital, an honest man whose scepticism rendered him moderate, who was pliable because he was a courtier, and who was, nevertheless, so unpractical as to believe that a reform of the laws could be undertaken in the midst of disturbances, and to disarm the government when the factions were arming themselves against it. By the Colloquy of Poissy (Sept. 1561), Catherine and de l'Hôpital attempted, after the manner of Charles V. at Augsburg, to achieve a religious peace. They were soon overwhelmed by the different factions. The Catholic triumvirate of Montmorency, the duke of Guise, and the marshal Saint-André so far abused the spirit of the Colloquy as to embroil the French Calvinists with the German Lutherans, and to make the Catholics believe that the Government was ready to sacrifice the faith. The Huguenots (*q.v.*) under Coligny and Condé, having obtained liberty of conscience in Jan. (1561), now demanded liberty of worship. When Michel de l'Hôpital, in the edict of Saint-Germain (Jan. 1562) granted the Huguenots a restricted right of worship the triumvirate, thinking themselves menaced, hesitated no longer. The massacre of Vassy (March 1, 1562) gave the signal for the outbreak of the wars of religion, and the abduction of the Queen-Mother and the young king from Fontainebleau gave the reins of government into the hands of the duke of Guise.

THE WARS OF RELIGION

At the commencement of these eight fratricidal wars, neither Protestants nor Catholics had any intention of overthrowing the king's authority, but rather sought to control it with a view to strengthening their cause. But as the contest became more and more embittered, Catholicism itself became a revolutionary force and a menace to the dynasty. The fanaticism of both parties rendered the struggle peculiarly ferocious, as witness the terrible cruelties of Montluc and Des Adrets in the south of France. Incapable of destroying each other each party sought allies outside the kingdom, and thus the struggle became international rather than national. The Protestants received the support of the Ger-

man Lutherans, the Calvinists of the Low Countries, and the protestant subjects of Queen Elizabeth. In support of the Catholics, Philip II. of Spain allied the pope, Spain, Italy, and the duke of Savoy. The two camps were divided, not by patriotism, but by religion. The war was fought in three principal theatres, the northern, Normandy and the Loire valley where Orleans, the centre of the Reformers, guarded the line of communication between Germany and the south; the south-eastern, Lyons and the Vivarais; and the south-western, Gascony and Guienne.

The first war lasted a year and cost the lives of the majority of the leaders. Threatened by an English invasion, which Coligny and Condé had purchased by ceding Havre, Guise captured Rouen by assault, but in the attack Antoine de Bourbon lost his life. At Dreux, fought to close the road to German reinforcements hastening to join the English, Saint-André was killed, but the victor, Montmorency, and Condé were taken prisoners. Guise was assassinated by Poltrot de Méré as he was attacking Orleans (Feb. 1563). Freed from his uncomfortable tutelage and head of a Catholic party of tried strength, Catherine was able to destroy the unity of the Huguenots in the Peace of Amboise (March 1563), by which Condé demanded freedom of worship only for the Protestant aristocracy; Catholics and Protestants then united to drive the English out of Havre.

The Second War.—A breathing-space of four years, during which Charles IX. attained his majority, followed upon this peace which satisfied neither party. Catherine, who desired peace at home and abroad, endeavoured in the conference of Bayonne (June 1565) to win over Philip II. to a sort of Catholic Holy Alliance that should combat heresy without using force. That the hour for moderation had not yet struck is shown by Condé's attempt to kidnap the king and Catherine, and to hold Paris. He failed, and the second religious war broke out in Sept. 1567. During the siege of Paris Montmorency was killed (Nov. 1567); the peace of Longjumeau, which followed in March 1568, sought to re-establish the settlement of Amboise.

The Third War.—The peace was of short duration. The fall of Michel de l'Hôpital, who had so often guaranteed the loyalty of the Huguenots, destroyed the moderate party (May 1568). Stirred up by the monks and the Jesuits, the Catholic reaction displayed itself everywhere. The leadership of the movement was entrusted by the cardinal of Lorraine to Catherine's favourite son, the duke of Anjou, the future Henry III. This disquieted Condé, who was in the west, where the Reformation was firmly established. Thanks to Tavannes, Anjou gained easy victories at Jarnac over Condé, who was slain, and at Moncontour over Coligny, victories that were nullified through the jealousy of Charles IX. (March-Oct. 1569). Coligny replied with a bold thrust at Paris and defeated the royal army at Arnay-le-Duc in Burgundy. Lacking resources and exasperated by the overweening conceit of the Lorraine family, Catherine signed the peace of Saint-Germain on Aug. 8, 1570. More generous than that of Amboise, it guaranteed to the Huguenots, for the first time, four fortified cities: La Rochelle, the key to the sea; La Charité, in the centre of France; and Cognac and Montauban in the south.

St. Bartholomew.—Charles IX., now 20 years of age and the husband of Elizabeth of Austria, set up as his own master, but merely exchanged the tutelage of his mother for that of Coligny, through whose eyes he viewed everything. The monarchy had negotiated with the rebellious Huguenots as though with a belligerent power. For its success, this policy demanded a complete reconciliation between the parties. This Charles attempted by seeking to marry his sister, Marguerite de Valois, to the son of Antoine de Bourbon and Jeanne d'Albret, queen of Navarre, that Henry who was both head of the Huguenots and heir to the crown should Charles IX. and his young brothers die childless. Coligny, a Huguenot but first of all a Frenchman, declared war against Spain in order to unite all patriotic Frenchmen and to divert the nation from civil war to the conquest of Flanders. Unfortunately his troops were defeated in the Low Countries, while the marriage of Marguerite—the first "mixed marriage"—scandalized the Catholics who were already jealous of the growing power of the Huguenots.

The attempted murder of Coligny, instigated by Henry of Guise as a reprisal for that of his father, was the first intimation of the general unrest. Charles IX. was incensed and the Huguenots wished to avenge their chief; but Catherine, alarmed at the imminence of war with Spain and fearing lest the Guises, as leaders of the Catholic reaction, should master the kingdom, persuaded her son, distraught with fear of both Guises and Protestants, to forestall the former by crushing the latter. The signal was given in Paris and throughout the provinces for a wholesale massacre of the Huguenots (Aug. 24, 1572).

The Fourth Civil War.—The massacre of St. Bartholomew settled nothing. It is true that Calvinism lost its greatest leader by the death of Coligny. The other chiefs, Henry of Navarre and Condé, as well as the wealthy middle classes, abjured their religion under pain of death at the very moment when the reforms effected by the Council of Trent cut away the ground from beneath their feet. But the pastors, relieved of the aristocratic politicians, and supported by the Protestant democracy, sounded the call to arms. This fourth war was chiefly remarkable for the siege of La Rochelle. During the war the Huguenots organized themselves and formed a State within the State. They were saved by the excesses of the reaction. A third party, which drew moderate men from both camps, was inspired even more by jealousy of the ambitions of the Guises than by horror at the massacres. Its leader was the king's brother, the duke of Alençon, who was supported by the brothers Montmorency, the parents of Coligny, the king of Navarre and Condé. The edict of Boulogne (1573) put an end to the war, and the Catholics lost their chief by the election of the duke of Anjou to the throne of Poland (May 1573).

Henry III. 1574-89.—Anjou had scarcely arrived in Poland before the news of Charles IX.'s death recalled him in haste to France. He found the kingdom divided into rival groups. His young brother, Alençon, abandoned the court to place himself at the head of the *Politiques*, or Third Party. Henry of Navarre resumed his Calvinism and imitated Alençon by placing himself at the head of the Protestants. A compact was concluded between them at Millau. Thus broke out the fifth religious war. Notwithstanding the victory won by Guise at Dormans, Henry III. in the peace of Monsieur (May 6, 1576) yielded all that the coalition demanded. Alençon received the appanage of Anjou, Touraine and Berry; the king of Navarre, Guienne; Condé, Picardy; while the Protestants obtained the restoration of their fortified cities and liberty of worship throughout the kingdom, with the exception of the neighbourhood of Paris. Seats were granted to them in the *parlements* and the massacre of St. Bartholomew was disavowed.

This was going too fast. In the reaction that followed upon this seeming abandonment of the kingdom by the king there arose a fourth party, the Holy League, of which Henry of Guise was popularly considered the leader. This league was organized on the lines of the Huguenot provincial associations, but with this difference—that it was designed to be offensive. The membership was primarily recruited from among the upper middle classes and the lesser nobility—men of honesty and caution. In the name of a people menaced by heresy it demanded from the States-General at Blois (1576) the re-establishment of unity of faith, and opposed to the divine right of incapable or evil monarchs the religious right of the nation.

In order to oust his rival, Henry of Guise, Henry III. determined to reveal himself an ultra-Catholic, but by declaring himself head of the League he lowered himself to the level of a party leader. Enraged by this trick, the League refused to finance his war against the Huguenots. Next Henry abolished the Edict that had placed Huguenots and Catholics on the same footing. The Huguenots, however, were not to be intimidated by the "packed" States-General of Blois, and, after a brief campaign, obtained in the Peace of Bergerac (1577) the restoration in a somewhat curtailed version of the previous peace. This was later renewed at Fleix (1580) after the so-called "Lovers' War," which arose out of the intrigues of the wanton Marguerite, wife of Henry of Navarre.

Would the Holy League succumb? The death of the duke of

Anjou after his foolish attempt to carve out a kingdom for himself in the Low Countries, coupled with the certainty of the accession to the throne of the heir of the effeminate Henry III., Henry of Navarre, upset the theories of both parties. The Huguenots found themselves again the supporters of the hereditary principle and the divine right of kings. The Catholics and the Guises, the latter inspired with a personal and selfish *arrière-pensée*, became the upholders of elective monarchy and the sovereignty of the people. Was it not unthinkable that the crown of the eldest daughter of the Church should be allowed to pass to a relapsed heretic? In order to facilitate their possible accession to the throne, the Guises, who had already fabricated a genealogy that led them back to Charlemagne, entered into an understanding at Joinville (Dec. 1584) with Philip II. and the pope to set aside Henry of Navarre and to substitute for him the old cardinal de Bourbon who, on his death, would leave the crown to Henry of Guise.

But patriots, lawyers, members of the *Politiques* and Huguenots alike joined to protest against this management of French policy by Spain. Civil war was renewed. The three Henries: Henry of Navarre, Henry III., and Henry of Guise, faced each other. Henry III. was in a difficult position. He did not dare to ask from the protestant Elizabeth of England the men and money which he needed. As the crafty Henry of Navarre did not mean to alienate the Huguenots, except by an apostasy profitable to himself, Henry III., while feigning to surrender everything to Henry of Guise, sought to play off the Huguenots against the Catholics and *vice versa*. But his favourite, Joyeuse, who should have easily defeated the king of Navarre, was himself defeated at Coutras, and Guise, whom he had hoped to see crushed by the German levies sent by Elizabeth to aid Henry of Navarre, was victorious at Vimory (Oct.) and Auneau (Nov. 1585). The League believed that nothing remained to be feared. It had organized in Paris a committee of action—the Committee of Sixteen—whose influence was felt throughout France. At the same time, from every pulpit the preachers were hurling insults at the king. On the threat of their arrest Paris revolted and called upon Guise, who entered the city despite the opposition of the king. The king's troops also having entered, a St. Bartholomew of the Catholics seemed possible. Barricades were set up in the streets. Henry III., besieged in the Louvre, was forced to appeal to Guise to suppress the rising, and took the opportunity of escaping to Chartres. Postponing his revenge for the moment, he yielded by the Edict of Union (July 1588) what he had refused in face of the barricades. But infuriated by insults and by the States-General at Blois, composed entirely of members of the League, and emboldened by the destruction of Philip II.'s invincible Armada, Henry III. resorted, like Charles IX., to political assassination. He imprisoned the old cardinal de Bourbon, and caused Henry of Guise and his brother, the cardinal of Lorraine, to be murdered (Dec. 23, 1588). On Jan. 5, 1589, Catherine de' Medici died. "Now I alone am king"—cried Henry III. But he was ruler of a sadly attenuated kingdom: Blois, Tours and Bordeaux. In order to win back his realm and, above all, Paris, he was reconciled with Henry of Navarre. The dagger of Jean Clément put an end to his work (Aug. 1, 1589). With his dying breath he named Henry of Navarre as his successor.

THE BOURBONS

Henry IV. 1589-1610.—Would the new king also find himself powerless between the threat of Huguenotism and the popularity of the League? He could reckon only on the support of a section of the Huguenots and the catholic minority of the *Politiques*; whilst his rival, the cardinal de Bourbon, who had been proclaimed king as Charles X., could count upon the support of the League, Spain and the pope. Henry had practically to reconquer the whole kingdom and to re-create its national unity. His most valuable assets were his personal charm, his quick-wittedness, tenacity and dauntless courage. Success would have come to him more easily had he not been a Huguenot; but he well knew that an abjuration of his faith would only ensure his position if he appeared sincere and not precipitate. Thus his first task must be the reconquest of his kingdom with the assistance of the aristocracy that, in general, had remained loyal to him.

Instead of retreating to the south he remained in the neighbourhood of Paris, on the banks of the Seine and within reach of the reinforcements sent by Elizabeth. Twice, at Arques (1589) and at Ivry (1590) he defeated the duke of Mayenne, the lieutenant-general of the League, and twice he fruitlessly attempted to storm Paris. Mayenne, aided by Alexander Farnese (*q.v.*), governor of the Low Countries, prevented him also from capturing Rouen, that strong base for a siege of Paris. Luckily the Committee of Sixteen had disgusted the upper middle class of Paris by their demagogic fury and offended the patriotism of the more moderate members of the League and of the *Politiques* by their open alliance with Philip II. and by their acceptance of a Spanish garrison for Paris. Mayenne, who was playing for his own hand with both Henry IV. and Philip II., was compelled to break up this party of fanatics and theologians (Dec. 1591), and in order to put an end to the temporizing policy that was hastening on the disruption of the kingdom summoned the States-General to Paris (Dec. 1592) as though he himself were king. Henry IV. replied by outlawing every deputy who attended. Three-fourths of them stayed away, but Philip II. and the pope were represented. This "shadow States-General," followed by the *parlement*, had the good sense and loyalty to turn a deaf ear to ultramontane claims and Spanish intrigues that sought to give the throne to the daughter of Philip II. The famous pamphlet *Satire Ménippée* reflected the awakening patriotism of the people, the weariness of religious disputes and the revival of public interest in national questions.

The movement in Henry's favour became irresistible when he decided to "take the step" and voluntarily renounced his protestantism at St. Denis on July 26, 1593. The coronation of the king at Chartres in Feb. 1594 completed the rout of the League. The *parlement* of Paris pronounced itself against Mayenne, the tool of Spain; and Brissac, the governor, opened the gates of his capital to the king. The example of Paris and Henry's clemency rallied round him the most prudent members of the Catholic party, such as Villeroy and Jeannin, who were anxious for national unity, but he was forced to buy the adherents of the League, who charged him more than 60 million francs for his own kingdom. The pontifical absolution of Sept. 17, 1595, finally drew the fangs of the League which was again betrayed by the frustrated attempt of the Jesuits' pupil, Jean Châtel, to assassinate the king. It only remained to expel the Spaniards. This war of deliverance was to efface the nightmare of the civil wars. Unhappily, the latter had so exhausted France that, notwithstanding a victory at Fontaine-Française (June 1595), Amiens was captured and Paris threatened with a siege. But since the defeat of the Armada, Spain had grown equally enfeebled. Philip II. therefore resigned himself to the treaty of Vervins (1598) which confirmed that of Cateau-Cambrésis and set its seal upon the decadence of Spain. Spain was no longer able to dismember or conquer France. The duke of Savoy was forced to capitulate in his turn. The treaty of Lyons (1601) at last brought the frontiers of the kingdom to the southern Jura.

The Edict of Nantes.—Within a month of the treaty of Vervins, the Edict of Nantes (April 13, 1598) was also signed. The example of the United Provinces enabled the Protestants to form a federal and Calvinistic state in France. Not wishing to break with them, Henry compromised with the Huguenot Government. In return for abandoning the question of freedom of worship, which was authorized only where it had existed before 1597, and in two towns of each *bailliage*, the Huguenots obtained an unrestricted liberty of conscience, admission to all offices, courts in the *parlements* composed equally of Catholics and Protestants, and an annual financial contribution from the royal treasury towards the salaries of their pastors. To these political guarantees Henry was forced to add territorial guarantees—100 fortified towns were to be occupied by the Huguenots at the expense of the king. This was certainly a "legalized republic" within the kingdom; a fact that explains why the Edict was only registered with difficulty because public opinion saw in it—and with reason—a source of future danger.

With the kingdom freed from the Spaniards and the religious

LE PUY, IN THE CEVENNES

An etching, by John Taylor Arms, of Le Puy, the chief town of the department of Haute-Loire, in the south of France. The town is situated on the steep slopes of the Rocher Cornelle, against the side of which (in the centre background) is the cathedral. On the summit of the Rocher Cornelle is a colossal statue of the Virgin; on the Rocher d'Alguille a little lower, stands the chapel of St-Michel-d'Alguille, a 10th century oratory.

wars concluded, all that remained for Henry IV. to do was to re-establish the royal authority that had been severely shaken since 1560. Was he to associate the nation with him in this work? As on the morrow of the Hundred Years' War, the weariness and the want of political intelligence in the land no less than the arrogance of the upper classes brought about a fresh abdication of the nation's rights. The cares of living made them forgetful of that necessity for control which had been maintained by the States-General from 1560 to 1593. And this time, moderation on the part of the monarchy, although a factor, was no longer to be an essential of its triumph. A man of action and a soldier, Henry IV. never expected to have to render an account of his actions to anyone except God Himself. He ruled by divine right. There were no more meetings of the States-General, only of the Assembly of Notables, and then only "with his sword in his hand." No longer was the power shared with a Council of Twelve. His "*conseil étroit*," limited to five members drawn from all the parties, was little more than a committee of clerks, of whom the principal, Sully, a madman for work but of a cross-grained honesty, was the architect for the restoration of France.

The most characteristic symptom of the misery of the kingdom was brigandage, which could be put down only by the gallows. The governors of the provinces furnished another danger. Great nobles with an armed following, they were rarely in open revolt against the king; but they were accustomed to quarrel and threaten, and to start underhand negotiations with foreign Powers that, at times, as in the case of marshal de Biron, duke of Bouillon, attained to the dimensions of a conspiracy (1601-02). As to the Protestants, contrary to Henry's hopes, their political activity showed no signs of diminishing. Between 1598 and 1601 they held three assemblies and managed to prolong until 1611 the possession of the *places de sûreté* which had been granted them only for eight years.

Sully.—The most urgent duty confronting the king was to resuscitate the corpse of France. With the restoration of order, he gave to the peasant the desire for work and by reducing the *taille* rendered him better able to pay the tax. By forbidding the seizure of agricultural tools, by draining the marshes, and by permitting the free sale of wheat and wine according to the state of the harvests, Henry encouraged agricultural prosperity. In this work he was aided by Sully. The scarcity of agricultural labour, the high wages following on the civil wars, and the rise in the price of agricultural produce, enabled Henry's desire that "every family should have a fowl in the pot on Sunday" to be more frequently realized. Moreover, in spite of Sully, who, with his hatred of luxury and waste, was an agrarian, Henry, with the aid of Laffemas and Olivier de Serre, sought to awaken industry in the towns; in which they would have been more successful had they seen that greater liberty could safely be given to the artisans. The edict of 1597, inaugurating the system of commercial companies, was a prelude to Colbert's legislation; but Laffemas' suggestions for syndical courts were never given effect. Nevertheless some industries were founded or re-organized: silk-weaving, for which the planting of mulberry trees was encouraged, glass-making, tapestry, etc.

Sully at least provided internal commerce with the necessary roads and canals. In the export trade Laffemas was again the precursor of Colbert in establishing the exemption from taxation of raw materials, and in prohibiting the importation of manufactured products similar to those made in the kingdom. Without actually winning back her former pre-eminence in the Levant, Marseilles gained for herself an honourable position in commerce. But Sully did not understand the significance of the commercial expansion started by Francis I. in Brazil and continued by Champlain in Canada. His real province lay in the supervision of finance, and in this he did not reveal himself an innovator; but he administered the wealth of the country as his own, honestly, carefully and strictly. His ideal was the accumulation of vast reserves in the Bastille. His only original creation, the edict of la paulette in 1604, was disastrous. In return for the annual payment of $\frac{1}{10}$ of the estimated revenue of the office, this edict made hereditary the judicial offices which had been held

for life only. By means of the millions thus brought in from day to day, the kingdom was relieved from the necessity of having to seek revenues from more regular and better sources: but political liberty and social justice were equally the losers by this extreme and ill-considered measure.

Henry IV.'s Foreign Policy.—The foreign policy of Henry IV. from 1598 to 1610 bore no resemblance to the "grand design" of Sully, the invention of a minister embittered and disgraced. Under the inspiration of Jeannin, Henry, who was the least visionary of kings, hovered between two contradictory policies: the war against Austria and Spain demanded by the Huguenots and *Politiques* like Sully, and a Spanish alliance, cemented by marriages and demanded by his second wife, Marie de' Medici, and the ultramontanes. The question of the Cleves succession at last forced him to take sides. The affair was grave in that Austria in claiming it sought to set foot upon the left bank of the Rhine. But the war was undertaken by Henry chiefly through an access of senile passion for the princess of Condé. The dagger of Ravaillac caused the curtain to fall abruptly on this new Trojan War (May 14, 1610). The *cornette blanche* of Arques, the *poule au pot* of the peasant, his fame as a lover, his lively and vigorous good humour have surrounded Henry with a halo of popular hero-worship not entirely justified by facts.

Louis XIII. 1610-43.—With the accession of Louis XIII. the unstable character of the monarchy was again made manifest. A sovereign at the zenith of his powers was succeeded by a child of nine. Since all power rested in and emanated from the king, a minority provided an opportunity for the elements of civil unrest to come to the surface. The Huguenots were resolved to defend their religious and political privileges; the princes of the blood and the great nobles were convinced that the hour of the monarchy had struck and that their own tenure of power was about to return.

Proclaimed regent by the *parlement*, Marie de' Medici was as jealous of power as she was incapable of exercising it. Instead of weakening her opponents by pursuing Catherine de' Medici's policy of playing off one party against another, she could think of nothing better than to distribute offices and money among the chiefs of both parties. Once the treasury was despoiled and Sully disgraced she lost all her influence and became the tool of the ambition of a low-born Florentine, Concini. Thenceforward policy became a matter of petty artifice: after having made a show of drawing the sword against Condé, the leader of the great nobles, the Queen-Regent opened her purse instead. The "costly peace" of Sainte-Menehould (May 1614) marks the first abdication of power on the part of the monarchy.

To avoid giving Condé the pretext for further rebellion, the States-General—as always during a minority—was summoned. It was to be for the last time until 1789; but their meeting was of little importance. No mention was made of reforms or of any endeavour to curb the government. Each of the three orders was concerned solely to defend its own interests—the nobles, their pensions; the clergy, the theocratic claims of the papacy; the Third Estate, the *paulette* that gave it a kind of hereditary judicial nobility. After subsidies had been voted and Louis XIII. declared of age, Marie de' Medici was able to bring about the marriage of the king with Anne of Austria, and that of the princess Elizabeth with the son of Philip III. The Protestants were rendered anxious by these Spanish marriages and by Sully's disgrace, and they united themselves to the party of the nobles who were irritated by the increasing power of the Concinis. Once again an incipient rebellion was nipped in the bud by means of governorships and pensions (Peace of Loudun, May 1616). Concini then conceived the plan of imprisoning Condé and of replacing the "greybeards" of Henry IV. by his own men, notably by the almoner to the queen, Richelieu. He thought himself the master of the kingdom and assumed towards the king a sort of condescending guardianship. That sealed his doom: Louis XIII. had him assassinated on April 24, 1617, and his widow executed a few weeks later.

As Richelieu rose to power through the influence of Marie de' Medici, so another adventurer, Albert de Luynes, came to the

front by reason of his influence with Louis XIII., a forlorn child whom he had contrived to amuse. The change was one of name only. Luynes became a duke and marshal in Concini's stead, while the duke d'Epemon, a supporter of Marie de' Medici, who had been banished to Blois, assumed the leadership of the opposition in place of Condé. The treaties of Angoulême (1619) and Angers (1620) resembled the "unwholesome" treaties of Loudun and Sainte-Menehould. The Huguenot revolt was of a more serious nature. At the instigation of the militant Catholics, Luynes conceived the unfortunate idea of re-establishing the Roman Catholic faith in Béarn, which had been Calvinist since 1563. But he was repulsed before Montauban, and his death in 1621 spared him the disgrace of his predecessor. His authority and intrigues were inherited during the next three years by Marie de' Medici. In those three years, there were three different ministers—all mediocre men. In the background stood the cold and subtle personality of Cardinal de Richelieu, who was to seize the helm and be for 18 years the king behind the throne.

Richelieu, 1624-42.—Richelieu was fortunate in the moment of his accession to power. The country was sick of rule by deputy and of the 14 years of disorder; moreover grave events in Europe demanded the pursuit of a vigorous foreign policy. In his *Testament* Richelieu has revealed that the course of action followed by him with an indomitable and often cruel determination had been planned at the time of his entry into the royal council. "I promise," he told the king, "to devote all my energy and all the authority that it may please you to place in my hands to destroying the Huguenots, abasing the pride of the great nobles, restoring all your subjects to their duty and in raising the name of your majesty among foreign nations to its rightful place." Everybody was forced to bow before the dogma of absolute monarchy; the Huguenots were the first on whom it was enforced. Taking advantage of Richelieu's pre-occupation in expelling the Austrians from the Valtelline, the emperor's line of communication with his Spanish lands, the Huguenot leaders, Rohan and Soubise, supported by their powerful organization and by England, took up arms in 1625. Richelieu, who was hampered by court intrigues, and who wished to engage in a political rather than a religious conflict, preferred to make peace; this was, however, no more than a postponement of the struggle. When in 1627, the English declared war upon France, and the Huguenots took their side, Richelieu resolved to fight to a finish. The capture of La Rochelle, after a siege marked by fierce fighting on both sides, and Rohan's defeat in the Cevennes, notwithstanding the help of Philip IV. of Spain, enabled Richelieu to impose upon the Huguenots the Edict of Alais (1629). Henceforth they ceased to form a separate body within the State.

The overthrow of "the four square feet of the king's cabinet" involved a longer and more bitter struggle. To achieve his end, Richelieu had to remain in power, a difficult task with a master like Louis XIII. who "liked to be governed yet bore being governed with impatience." Taciturn and distrustful, Louis gradually came to trust his minister, but never learned to like him. He was accustomed to listen to his mother who accused the cardinal of "black ingratitude," and to his wife—too good a Spaniard—who reproached him with desiring to dismember her country. The heir to the throne, the king's brother, Gaston of Orleans, who posed as the beloved prince in all conspiracies directed against Richelieu and each time ultimately played Judas, had oftentimes to be reckoned with. These divisions within the royal family were naturally exploited by the nobles. Suspicious and irritable, Richelieu frequently believed himself to be threatened when he was not; and, in identifying himself with the king, sincerely believed that he was defending the king's authority and not that of the cardinal. As long as his position was uncertain he was forced to suppress court conspiracies, time and again displaying his merciless severity: on Chalais, who sought to prevent the marriage of Gaston of Orleans with Madame de Montpensier, the richest heiress in the kingdom (1626); on the brothers Marillac; and even on the two queens, after the Day of Dupes, when they believed they had been successful in securing his dismissal (1630). There were also armed revolts against the

powerful minister, for sharing in which Montmorency, governor of Languedoc, forfeited his head in 1632. Other rebels against the cardinal's authority summoned foreigners to their aid—namely de Thou and Cinq-Mars, who allied themselves with Spain, but were overthrown and executed at Lyons (1642). Obedience to the king became general and unquestioned throughout France.

Internal Administration.—Before Richelieu's day there had been no effective institutions of control other than advisory councils, which might have developed further had the king been willing; Richelieu, however, deliberately suppressed them. According to his ideas the king should formulate his policy in secret: the king's will was law. Nobody else should occupy themselves with politics—neither the *parlements* nor the States-General, still less the public. The press, only just created by Renaudet, was forced into the service of the Government, as was the Académie Française. Provincial and municipal privileges met with the same treatment. Under the influence of a natural but excessive reaction against the decentralization that had followed the League, Richelieu fell into the opposite error of a too great concentration of power. He denied to the people the right of criticizing the acts of the Government, and killed the spirit of public opinion revealed in the *Republic* of Bodin, in de Thou's *History of His Own Time*, in La Boétie's *Contre-un*, and in the *Satire Ménippée*. But in establishing despotism Richelieu did not create new instruments of government. He made use of the Intendants (*q.v.*), the revolutionary creation of the 16th century, ancestors of the commissaries of the convention, lawyers of middle class birth, detested by everyone and, therefore, all the more trustworthy. By their means he began that great transformation of the monarchy by which influence was entrusted to civilians and bureaucrats, to the exclusion of soldiers and aristocrats.

Finance.—With his passion for the uniform and useful on a grand scale, Richelieu's vision was far-reaching. He dreamt of destroying corruption and of reducing the taxes. But this required peace, and soon there arose an open issue between the reforms and the necessary war. War is a costly amusement. Richelieu maintained a lofty attitude towards finance, and left the petty details to his agents—D'Effiat and Bullion.

It soon became necessary to revert to old and bad expedients and to strain to the utmost all the resources of the financial system. This was the price of his nationalist policy. Moreover, since 1630, among the rural population for whom this policy was a dead letter, insurrections inspired by sheer misery were frequent; the *Croquants* rose in the south, the *Va-nu-pieds* in Normandy. Even the *rentiers* of the Hôtel de Ville, ordinarily a peaceable people, were excited by the curtailment of their incomes, and in 1639 and 1642 were roused to fury. Despite the great work that was accomplished the treasury remained empty and the reforms a dead letter. By education and temperament a priest, Richelieu looked upon material concerns as of secondary importance. He could organize neither an army nor a navy, neither justice, nor finance, nor colonies, but at most a police system: he did not reform—he shattered. His true greatness lay in the ecclesiastical art of diplomacy: his work was wholly accomplished in the field of foreign policy where he displayed most continuity and foresight, perhaps because in foreign affairs alone he was able to work unhindered.

Richelieu's Foreign Policy.—Actually his whole foreign policy was dominated by the Thirty Years' War. By it he made France and unmade Germany. It was the support of Germany that Philip II. had needed to realize his dream of a Catholic empire. The election to the imperial throne of Ferdinand II. of Styria had brought this support to his Spanish cousins in 1619. All the forces of the Habsburg monarchy were thenceforward united so long as the lines of communication were maintained in the north with the Netherlands, and in the south with Milan, so that there would be no flaw in the steel vice which locked France in on every side. Ever since his entry into the ministry Richelieu had applied himself to breaching the Habsburg ring. Hindered by the Huguenot problem and by the intrigues of the nobles, he had been able to intervene only indirectly and in a very restricted

manner. By occupying the Valtelline, he severed the emperor's communications with Spain; by swift action at Susa, he forced the duke of Savoy to make peace; and, finally, he obtained for a French prince the succession to the duchy of Mantua (1629).

After being freed from the Calvinists by the peace of Alais, Richelieu everywhere attempted to stir up enemies against the emperor, victorious over the Bohemian Protestants at the White Mountain and the king of Denmark at Lutter. He united Sweden and the Catholic and Protestant Electors, who were disquieted by the Edict of Restitution (1630) which forced them to surrender the ecclesiastical estates secularized since 1552, and by the victories of Ferdinand's brilliant general, Wallenstein. Next he stirred the United Provinces to action; and finally his skill effected a union of Bavarian Catholicism with the Lutheranism that dominated northern Germany, thus disarming Austrian imperialism by the removal of Wallenstein and a refusal to elect Ferdinand's son as king of the Romans. Twice Richelieu had succeeded by the purse rather than the sword in re-opening the passes of the Alps and of the Rhine. About the same time Gustavus Adolphus, called in by Richelieu to take the place of the exhausted king of Denmark, entered Pomerania and, soon finding himself master of Germany and of the rich valley of the Rhine, sought, in face of Richelieu's opposition, to establish a great Protestant empire on the ruins of Catholicism. This immoderate ambition, even after the death of Gustavus Adolphus at Lützen (1632) provoked a violent Catholic reaction just when the Protestant alliance was dissolving as a result of the defeat at Nördlingen (1634), and at the moment of the murder of Wallenstein, whom Richelieu had sought to set up as a rival to Ferdinand in Bohemia. In 1635 the emperor again dominated Germany.

As his allies could no longer sustain the combat alone, Richelieu was himself compelled to make open war. He took into his pay the army of a German *condottiere*, Bernard of Saxe-Weimar, and came to an agreement with the Swedish chancellor, Oxenstierna, and with certain German princes; he let loose the dukes of Savoy, Parma and Mantua against Spain in the Milanais; and, finally, he allied himself with the Dutch to achieve the conquest and partition of the Spanish Netherlands. War followed in earnest (May 19, 1635). At the outset it went badly for France. The capture of Corbie, near Amiens, by the Spaniards and the invasion of Franche-Comté by the imperial troops served to reveal the vulnerability of Paris, so dangerously near the frontier. But (1638-40), owing to Bernard of Saxe-Weimar and to Guébriant, as well as to the Swedish Generals, Alsace was conquered. Faced with revolts in Portugal and Catalonia, Spain lost Artois in 1640 and Roussillon in 1642. The defeat of the Spanish Habsburgs rendered their Viennese relatives more willing to negotiate. Richelieu's death (Dec. 4, 1642) prevented him from witnessing the triumph of his policy in the ensuing negotiations; but his dictatorship was justified by its results. Six months later Louis XIII. followed his minister to the grave (May 14, 1643).

Mazarin (1643-61).—A pupil of Richelieu's, Mazarin continued and completed his work. But the task was not done without many set-backs. As in 1610, the crown fell to an infant, for Louis XIV. was only five years of age. The regent was no longer an Italian but a Spaniard, and the first minister was again a foreigner, like Concini. Anne of Austria succeeded in annulling the will of Louis XIII., as had Marie de' Medici that of Henry IV., through the *parlement* of Paris, which was flattered by the opportunity of taking an active part in politics. Then, in a new Day of Dupes, this Spaniard of waning charms, who had been neglected by her husband and insulted by Richelieu, gave her full-blown and opulent person, together with absolute power, into the hands of Mazarin, instead of those of Gaston of Orleans. Of a handsome presence, amiable, very pliant, a lover of money to which he helped himself liberally, a superb diplomat, Mazarin justified Richelieu's confidence in him no less than the favour of Anne of Austria. For the maintenance of his authority in the kingdom, he relied upon the success of his foreign policy. Through his adroit diplomacy and the military genius of two young generals—Condé, the impulsive, and Turenne, the prudent—the great tree of the House of Austria was shaken to its very roots. At Rocroi

(May 1643) Condé destroyed the renown of the famous Spanish infantry, afterwards joining forces with Turenne in Alsace. The Rhineland was freed by the victory at Freiburg-im-Breisgau (1644) and later the generals were again victorious at Nördlingen, Bavaria (1645). Meanwhile Mazarin laboured unceasingly to preserve the Swedish alliance. The Swedes were finally victorious at Zusmarhausen in Bavaria, when Turenne effected a junction with Wrangel, at the same moment that Condé, at Lens, for a second time defeated the Spaniards. At last Ferdinand III. brought himself to sign the peace that had for seven years been under negotiation.

Treaty of Westphalia (1648).—For more than a century and a half the charter of Europe, the Peace of Westphalia dispelled the Habsburg dream of a unitary Catholic and German empire. The victory had fallen to the "liberties of Germany," and to German Particularism. Germany was little else than a "republic of princes," a vast anarchical region under the protectorate of France and Sweden. The territorial gains were no less great. Apart from the confirmation of the cession of the Three Bishoprics, conquered in 1559, the acquisition of Alsace safeguarded the Rhine frontier and prevented the Spaniards from uniting Luxembourg to Franche-Comté. The Fronde (*see below*) afforded a momentary relief to Spain who, believing that Mazarin's triumph was not a lasting one, had refused to be a party to the peace.

It was far less difficult for Mazarin to assure the safety of France than to govern the kingdom. With the king a minor, he found himself confronted with the difficulties that Richelieu had been unable to solve, and which had become even more complicated. Richelieu had governed in the name of a king of full age, and in the face of single opponents. With his position hampered by his foreign birth and by the king's minority, the adversaries of Mazarin had had ten years to coalesce against him, whilst everyone was sick of government by ministers. The maintenance of four armies, the necessity of supporting insurrections in Portugal and Catalonia, and the payment of subsidies to allies, had made taxation crushing. All who had been held in check by the iron hand of Richelieu sought to free themselves. The nobles, cramped by the disciplining of the nation; the middle classes, whose commercial interests were suffering; the *parlements*, ambitious of playing a rôle in political life similar to that of the English parliament with which they shared a common name; the downtrodden populace—all made alliance. They were inflamed by the same fever that was then burning in Catalonia, Portugal, Naples and England.

The Fronde (1648-53).—The coalition was born of the fiscal problem—ever the Achilles heel of the French. In 1648 the monarchy had reached the end of its resources. Completely immersed in the European problem, Mazarin left finances in the hands of his deputy, Particelli; if things went ill, he relied upon ingenious devices to settle them, but when, to fill the treasury he revived old edicts and withheld four years' salary from the holders of offices, the storm broke against him in the *parlement*. Mazarin made the mistake of thinking this to be a new edition of that aristocratic cabal which he had so easily crushed at the beginning of the regency. The *parlement* of Paris, which he had thought to win over by exemption from the forced levy, made common cause with the *Cour des Comptes* and the Great Council, and in the declaration of July 27, 1648, sought to substitute constitutional for absolute monarchy. Since all her forces were at the war, Anne of Austria was helpless and yielded; but when the victory of Lens set free Condé's army, she arrested some of the more violent members of the *parlement*. There followed insurrection and, as in the days of the League, the erection of barricades in Paris. Once again Anne capitulated and, fearing for her safety, fled with the young king to Saint-Germain. Civil war succeeded, involving in the general upheaval great lords, members of the *parlements*, generals, princes of the Church, the common people and mercenaries from the Thirty Years' War. As its name indicates, the Fronde was a crazy farce, played by grown-up children in many acts.

The first and shortest phase was the Fronde of the *parlement*. At a time when the whole world was a little mad, the *parlement*

had imagined a loyalist rebellion. Its armed protest was directed, not against the king, but against Mazarin and the men to whom he had delegated authority; but it was soon disgusted with its allies—the princes and nobles who had proffered their swords solely because they would thus be in a better position to extort concessions, and the Parisian mob which had been aroused by a warlike ecclesiastic, a Catiline in a priest's cassock, Paul de Gondi (*see* RETZ). When, therefore, a proposal was made in the *parlement* to receive a Spanish envoy *sur les fleurs de lys*, that assembly hastened to make terms with the Court by the Peace of Rueil (March 11, 1649).

In the short respite (April 1649–Jan. 1650) that followed the Peace of Rueil there ensued a scramble for power among the nobles: Condé, proud and turbulent; the coward Gaston of Orleans; the incapable Conti and the intriguing Longueville, the betrayed husband. The victor of Lens and Charenton, thinking the world at his feet, assumed so dictatorial a manner that Anne of Austria and Mazarin, assured by Gondi of the support of the *parlement* and the mob, had him arrested. In defence of Condé, a great conspiracy of Court ladies sought vainly to arouse Normandy, Burgundy and Bordeaux. Enslaved by Madame de Longueville, Turenne involved himself with the Spaniards and was defeated at Rethel (Dec. 15, 1650). Unhappily, and as was his habit, no sooner was he victorious than Mazarin forgot his promises, especially that of a cardinal's hat for Gondi. The nobles and the *parlement* made common cause, and Mazarin fled to Brühl in the electorate of Cologne, whence he continued to dominate the queen and the kingdom (Feb. 1651). But the leaders of the two parties—Condé, designedly released from prison, and Gondi, who hated him—were soon engaged in a mortal rivalry. The exile of Mazarin and the attainment by the king of his majority (Sept. 5, 1651) brought a temporary lull in the storm which broke out again on the return of Mazarin (Jan. 1652). Because he had not been given Mazarin's place as chief minister, Condé renewed the civil war with the help of Spain. Successful against the royal army at Bléneau, taken by surprise at Etampes, nearly destroyed by Turenne at Porte Sainte-Antoine, and only saved through the exertions of La Grande Mademoiselle, the daughter of Gaston of Orleans, Condé lost the support of Paris by permitting the massacre of a number of its citizens who were demonstrating in front of the Hôtel de Ville in favour of peace. A general weariness of civil war gave a good opportunity to Mazarin's agents. That the way might be smoothed to a reconciliation, the cardinal pretended to exile himself again to Bouillon. A general collapse of the revolt ensued. Condé had taken refuge in Spain where he remained seven years, Gaston of Orleans was in exile, de Retz (Gondi) in prison and the *parlement* confined to its judicial functions. The field was thus left open for Mazarin who, four months after the king, returned in triumph to the Paris that had lately driven him forth with jeers and mockery (Feb. 1653).

The Administration of Mazarin.—The work of restoring the damage wrought by four years of destruction awaited him. He held the nobility in check by means of the rich dowries of his numerous nieces, and henceforth employed them in war and at court. Others, like de Retz or de la Rochefoucauld, sought consolation in their *Memoirs* or their *Maxims*; the *parlement*, which had confused political power with the exercise of judicial functions, learnt in the session of April 13, 1655, at Vincennes, that the days of political demonstration were ended. Power was given to middle-class men, such as Servien, Le Tellier and Lionne, who had faithfully served Mazarin in evil days. Like Henry IV. after the League, so Mazarin after the Fronde gradually redeemed a ruined kingdom. Like Richelieu he covered France with a network of agents, who were henceforth a regular and permanent part of the administration, and who assured him of that peace and security without which he could not have carried out his immense speculations. His imitator and superintendent, Fouquet, the Maecenas of the future Augustus, cast over this gambler's policy the brilliant cloak of artistic prowess and the glamour of literature.

The Spanish War still dragged on; for the two countries were

worn out by 20 years of war, and while both were incapable of terminating it by superior force neither would yield by seeking peace. Spain had the advantage of being able to transport troops to the Netherlands by sea and to raise mercenaries within the empire; by breaking the alliance of Spain with Cromwell, Mazarin struck a blow at these sea-communications. Unable to prevent the election to the empire of Leopold I. on the death of Ferdinand III., he cut off the emperor from the Netherlands by grouping together the princes of western Germany in the League of the Rhine, which insisted upon the neutrality of the empire (1658). Soon afterwards the decisive moment arrived with Turenne's defeat of Condé and the Spaniards at the battle of the Dunes and the subsequent conquest of maritime Flanders. The victor was marching upon Brussels when Spain sued for peace.

The Treaty of the Pyrenees.—By this treaty, France gained Roussillon and Cerdagne in the south; Artois with certain posts in Flanders, Hainault and Luxembourg in the north. Mazarin crowned his work by the marriage of Louis XIV. to the eldest of the Spanish infantas, Marie-Thérèse, who renounced her claims to the Spanish throne in return for a dowry of 500,000 crowns—a clause that held a menace for the future in view of the extreme poverty of Spain. Mazarin had thus realized the wise and cautious policy of Henry IV. and Richelieu—the destruction of the catholic empire of Philip II. and the stabilization of the monarchy. On his death (March 1661) the stage was set for the reign of the *Grand Monarque*.

Louis XIV. (1661–1715).—For more than 50 years Louis XIV. was the personification of absolute power. He both reigned and governed. He was the sole author of the policy that brought the French monarchy to a position of pre-eminence in Europe such as it had never before attained. His reign was not one of continuous progression and may be divided into two distinct sections. The first ended with the death of Colbert (1683), the revocation of the Edict of Nantes (1685) and the revolution in England (1688) which upset the traditional system of alliances: the second, in which all the germs of decadence were developed, culminated in the depopulation and bankruptcy of the kingdom and in the formation of the coalitions abroad (1715). His whole training had fitted Louis for personal and autocratic rule; his tutors were nothing but courtiers; the Fronde had inspired him with a horror of revolutions, parliamentary remonstrances and disorder in general; and the universal reaction of public opinion in France against Leagues and Frondes and government by ministers, gave him a boundless popularity with the nation. To the performance of his *métier de roi*, this handsome youth of 22, endowed with a superb constitution and, up to then, avid of pleasure, brought a mediocre intellect, great commonsense, a true and cautious judgment, a charm of manner and dignity of presence that impressed everyone who came in contact with him, and finally, a very clear conception of both his rights and his duties.

For the performance of his duties, which he carried out with exemplary regularity and assiduity, Louis held himself responsible to God alone. To the *lieutenant de Dieu*, the utmost humiliation would be to accept his power from the hands of the people. As to his rights—these he conceived to have no other limit than his own interest and his duty towards God. In this belief he was an apt pupil of Bossuet. There were to be no grand-viziers or mayors of the palace, but only ministers who should be the trained instruments of his will. The superior rights of the people, and with them the States-General and the independent courts of justice, all these must be swept away; there could be no individual rights among his subjects, save only the use of their property; the sole remedy offered for their miseries was prayer and resignation. Liberty he tolerated for himself alone. Thus did the nation identify itself—and gladly—with the person of the king.

But this god upon earth required his temple. He made it at Versailles, where everyone and everything was his creation and offered up adoration to their maker. The highest nobility of France competed for posts in the royal household. The *anciennes cohues de France*, gay, unceremonious and military, gave place

to a stiff court with an elaborate etiquette in which the king pontificated. Attendance at court was the first and only duty in the eyes of a proud prince who saw and noted everything and, above all, the absentees. Versailles became the centre of the national life and a model for foreign courts. If he thus played a part in the history of civilization, he also profoundly affected the social and political life of France. Through the insistence upon etiquette and the place-hunting that were the guiding principles in the lives of the courtiers, Versailles sterilized the leisured upper classes; its extravagant cost of upkeep exhausted the working classes and, finally, it separated the king more and more from his kingdom. But, however deified, Louis XIV. could not exercise power in solitude. He was aided in his work of government by a hierarchy of officials, who were neither nobles nor ecclesiastics, but taken from the commonalty (to the indignation of the aristocratic Saint-Simon) and by special councils over which he regularly presided. This entailed a working routine which he invariably observed.

In administrative matters he proved himself no innovator. Refusing to sanction any radical reform, he devoted himself to organizing in all its details the mechanical system he had inherited from his ancestors, both in the central as well as in the provincial administrations. He destroyed all vestiges of an autonomy that might have cast a shadow upon his own power. The governors were reduced to mere puppets; the *parlements* limited to their judicial functions; the provincial estates met only on a royal summons and were curbed on occasion by *lettres de cachet* (*q.v.*); the liberties of the municipalities were destroyed on the pretext of their bad financial administration. On these ruins Louis erected the absolute power of his intendants (*q.v.*).

Colbert.—Taxation and the army were the keys to Louis's policy. Born in a clothier's shop at Rheims, hard and crabbed, estimable for his love of work and regard for the public weal, Colbert offered himself to Louis to help him in becoming a working and regnant king. The most urgent task was to anticipate the fury of the downtrodden and to prevent a repetition of 1648. His first efforts were to restore the depleted treasury; by such means as the *chambre ardente* (1661-63) to recover everything that the farmers of the revenue had stolen since 1635; and to condemn Fouquet, who wished to make his financial power the stepping-stone to political power. Towards these financiers the monarchy had merely fluctuated between complaisance and severity. As a good man of business Colbert determined that the national accounts should be kept with the same attention to exactness and detail required in those of a shopkeeper, but although he was a great organizer of the public accounts Colbert was less effective as an organizer of taxation. He preserved the old system of demesne revenues and reactionary imposts; if he lessened direct taxation, such as the *taille*, and heightened indirect taxation, such as the *aides*, he did so not from sympathy for the small taxpayers, but because the *aides*, with a wider field of assessment, brought in a better return. He continued to extort money from whatever source he thought inexhaustible; now from the Church, whence he extracted voluntary gifts; now from the *rentiers*, to whom he applied the classic expedient of needy royalty—the reduction of its payments. Like Sully and Richelieu, Colbert believed that to command a country to produce was enough to render the whole nation rich and ready to pay taxes gladly. He knew nothing of the importance and sensitiveness of credit; he cherished the absurd hope of doing without loans in a France burdened with that over-production which he praised himself for having created; and when, after some years of normal budgets, the two great passions of Louis XIV.—conquest and building—forced him in 1672 to have recourse to borrowing, he was heartbroken.

A mere accountant, exacting and exact, Colbert was more original in economic matters. Not that he was concerned about the individual welfare of the people, nor preoccupied with theories. Commercial and industrial prosperity afforded him no other interest than that of making the country wealthy and the State great. He wished to give to 17th-century France the same modern and industrial character that had been given to the mari-

time countries by the New World. As the manufacturers and merchants were either indifferent or lacking in initiative, Colbert replaced them by royal authority. He made general the mediaeval system of corporations, governed manufacture by stringent regulations which aimed at winning foreign markets by meticulous probity in business, and created industry on a grand scale by his energy and outstanding genius for organization. But by placing industry in a strict dependence upon finance Colbert aggravated the servitude of the workers by the further servitude of their work. His royal factories of silk, glass, lace, linen, tapestry, etc., prospered under royal protection, but at the expense of the small industries. After his death, deprived of their crutches and injured by the intolerant policy of the king, his industrial creations, except for the manufacture of articles of luxury, collapsed. Like all his contemporaries, Colbert believed that the true secret of commerce and of the prosperity of a country lay in selling as much as possible to the foreigner and buying as little as possible from him. Thus gold would flow into and not out of the country. Sometimes a free trader, sometimes a protectionist, Colbert was always a realist. If he imposed the prohibitive tariffs of 1664-67, he opened Marseilles and Dunkirk as free ports, built the *canal du midi* connecting the Mediterranean with the Atlantic, and reduced many taxes. But he failed to establish a unified system of weights and measures and to abolish the inter-provincial customs that made of France a Europe in miniature. Bureaucracy alone was inadequate in a land in which individual effort was suspect.

That he might increase foreign trade Colbert inaugurated a colonial and maritime policy which was to prove the most original and most fruitful of his achievements. Like Richelieu, he sought new markets and endeavoured to revive French interest in those distant enterprises in which it had been outstripped by the English and the Dutch trade since the Wars of Religion. He extended the New France from Canada to the Mississippi by supporting la Salle in Louisiana; to this he added the French tropical possessions in Guiana; he established the king's authority on the African coast from the bay of Arguin to the shores of Sierra Leone; he gained a footing in Madagascar; and he established the first French trading-posts in India. A commercial monopoly of these territories was given to the great royal companies. To enable France to defend her colonies, Colbert created a navy that became the passion of himself and of his son, Seignelay, and for its accommodation Vauban constructed great arsenals at Brest, Havre, Dunkirk, Rochefort and Toulon. He took convicts to man the Mediterranean fleet, and for that on the Atlantic he introduced the system of naval conscription that has remained almost unmodified since. Thanks to his efforts, the French navy, at least until 1692, was in perfect condition. His unwearying activity displayed itself also in the organization of justice, police and administration. Although his forestry code remains a model to this day, while the great codification of his uncle, Pussort, was an attempt to unify legislation, Colbert preserved in its entirety the ancient machine of government. The hereditary transmission of offices of justice was maintained and the administration of the law continued slow, corrupt and cruel. Organized in 1667 by La Reynie, the police became a ministerial force; and in like manner the Academies were charged by Colbert with the regulation of Letters, Science and the Arts.

The system established by Colbert worked steadily until 1675, when everything had to be sacrificed to the wars in Flanders and the splendours of Versailles. Versailles and war squandered the wealth of a country in which the peasants, almost prostrate under the burden of taxation, were everywhere in a state of revolt, and from which the persecuted Huguenots were fast emigrating. Moreover, Colbert's work had inherent in it the cause of its own destruction. Like a good Cartesian, Colbert conceived of the State as a vast "machine," of which all the various and well-ordered parts received their impulse from an outside source—himself. He did not understand, nor did his contemporaries understand, that efficient reform will not result from a government acting towards a nation as though it were some insensate object created solely to obey and pay.

Louvois.—At the accession of Louis XIV. the army was in a

wretched state. The suave but forceful energy of Le Tellier and the authoritative will and uncompromising tenacity of his son, Louvois, devised for the king an army that up to that time had been in the hands of a nobility virtually independent and scornful of all civil control. A severe discipline coupled with the suppression of fraudulent contractors, the equipment of the troops with clothes and arms at the king's expense, a proper grading of the officers, a regular system of recruiting and of supplies, the suppression of the great military offices, the control by the civil authorities of the governors of fortified towns and of their army leaders by commissioners and the intendants—all this was the work of Le Tellier and Louvois. The army had become an all-powerful weapon which belonged to and obeyed the king alone.

Absolutism and Religion.—Louis XIV., the Most Christian King and eldest son of the Church, considered himself the ruler not only of the bodies of his subjects but of their souls. Thus he felt himself called upon to establish the unity of the faith and to repel with the hand of orthodoxy all Dissenters, Huguenots, Jansenists or Quietists, whose independence was as insupportable to him as to Philip II. or the Stuarts. Moreover, it was impossible for a king by divine right to yield to any other authority; hence his quarrels with the papacy. Gently at first, later more violently as he became still more of a bigot, Louis' absolutism in religious matters asserted itself with the willing consent of a nation in love with the ideal of unity.

Although since the Peace of Alais they had been deprived of their political privileges, the Huguenots had enjoyed freedom of worship and had prospered in the fields of industry, agriculture and commerce. Religious division, however, hindered the unification of the kingdom. The priests, under the influence of the *Compagnie du Saint-Sacrement* sought from 1651 onwards to unify matters—at first by persuasion, later by a legal and narrow interpretation of the Edict of Nantes. His passion for absolutism, his religious zeal—the more active since he wished to make amends for his injuries to public and private morals, the financial necessity of increasing the free-will offerings of the clergy and of gaining their support in his quarrels with the papacy—all these led Louis XIV. to identify himself with this foolish policy. Between 1661 and 1685 the Huguenots were successively excluded from the States-General, the diplomatic service, and the municipalities, and were deprived of their hospitals, colleges, academies and schools. Fines proving inadequate, soldiers were quartered upon the recalcitrant by Louvois until the day when Louis, at the instigation of the priests, revoked the Edict of Nantes (1685). There followed on the part of the Huguenots an emigration *en masse*, and later, the terrible revolt of the Camisards (*q.v.*) which held the royal armies in check in the Cevennes from 1703 to 1711, at a time when the kingdom was threatened with invasion. Nevertheless, even if it was decimated numerically and intellectually, Protestantism was not entirely destroyed.

The Jansenist Movement.—The persecution of the Jansenists proceeded from the same ideas. Founded by the Abbé de Saint-Cyran on predestination, a doctrine that was austere in the general licentiousness of that age, preserving a noble dignity in the midst of universal servility, the sect was recruited from the disillusioned followers of the Fronde, and owing to the brilliance of its writers and thinkers—Arnauld, Pascal and Racine—made a formidable body of opinion. The inmates of Port Royal were also subjected to the *dragonnades* (1669). Three years later the dispute over the *régale* raised by the Jansenist bishops of Aleth and Pamiers reawakened the persecution. Port Royal was destroyed, the nuns dispersed, and the ashes of the dead scattered to the four winds (1709–11). The Bull *Unigenitus* (1713) which once again condemned their doctrine, reopened a dispute that survived the death of Louis and filled the 18th century with its reverberations (*see* JANSENISM).

Quietism.—The much less grave affair of the Quietists (*see* QUIETISM) arose from the same desire for uniformity. That it was even for a moment serious was due to the fact that Madame de Maintenon and the nuns of Saint-Cyr were waging war upon the mysticism of Madame Guyon, who had abandoned dogmas and prayers and given herself up to the pure adoration of God. Fénelon, who had adopted her doctrines, was condemned in 1699, and the sole importance of the affair arose from his duel with the representative of the principle of authority, Bossuet. The "libertines," free-thinkers like Richard Simon and Bayle, were exiled; but their doctrines were to revive again in the 18th century.

Louis XIV. and the Papacy.—Although on matters of faith he was in accord with the pope, Louis XIV. was not prepared to admit any diminution of his own authority through papal claims to universal supremacy. The quarrels arose out of questions of form like that of the Corsican guards who fired upon the carriage of the French ambassador; but a more serious dispute (1673) was that over the *régale* (the right of the Crown to the revenues of all vacant bishoprics). Louis XIV. wished to extend this claim over the whole of France, and thus to co-ordinate the new additions to his kingdom with the system obtaining in the north and centre. The pope supported the protest of the bishops of Aleth and Pamiers, and the king appealed to a General Assembly of the clergy, and to the *parlement*, to define the precise limits of the authority to be exercised by the Crown, the Church and the papacy. By denying the papal authority, the Declaration of the Four Articles (1682) consecrated the Gallicanism (*q.v.*) which gave to the king the semi-divine authority henceforward the official belief of the *ancien régime*. It declared that the pope had no standing in temporal matters; that general councils overrule him; that the rules of the Church of France in France are inviolable; and that papal decisions on matters of faith are irrevocable only by consent of the Church. The dispute over the diplomatic immunity of the palace of the French ambassador at Rome, wherein Louis was clearly wrong, still further exacerbated the quarrel; but during the War of the League of Augsburg, in the pontificate of Innocent XII., Louis XIV., like so many others, went to Canossa (1693).

Foreign Policy of Louis XIV.—Although she had a strong and stable government, and occupied the first place in Europe, France had not yet fulfilled her destiny. The moment had come for Louis XIV. to turn to foreign policy and again press the claim of France to her "natural frontiers." Arrogant demonstrations preceded his action: the navy was forbidden to salute the English flag in the narrow seas, and precedence was claimed for the French ambassador over the Spanish ambassador in London. Louis sought to justify these pretensions by offering to lead a crusade against the Turks in the Mediterranean and Hungary. But it was soon clear that the real question was that of the partition or absorption of the Spanish inheritance. An alliance between Holland—freed from Spain yet fearful of its position—and France with an exposed northern frontier, was natural. As long as France had neither a navy nor great commercial interests, she could easily ally herself with either England or Holland who were fighting for a colonial empire. All this was changed, however, when, by the hand of Colbert, France entered into the commercial rivalry, and still more when by the conquest of the Spanish Netherlands, Louis XIV. became a more dangerous neighbour to the Dutch than ever the Spaniards had been. For the success of the new French policy the neutrality of England was essential, and since the days of Edward III. England had realized that such a policy was neither in accord with its tradition nor its interests. But the Anglo-Dutch rivalry, and later the Stuart restoration, aided by Louis XIV., played into the hands of France until the day when William of Orange, having overthrown the Dutch republic and the Stuarts, became the soul of the coalitions and set himself, both on sea and land, to destroy the projects of Louis XIV.

The War of Devolution, 1667–68.—On the death of his father-in-law, Philip IV. (1665), Louis XIV. claimed Flanders in the name of his wife, Marie Thérèse, whose dowry remained unpaid. A conflict between England and Holland for some time prevented the outbreak of hostilities, and it was not until Louis had mediated in the Treaty of Breda and Hugues de Lionne, his clever secretary for foreign affairs, had isolated Spain, that France finally declared war. Turenne conquered Flanders (June–Aug. 1667) and, as the queen-mother of Spain would not yield, Condé occupied Franche-Comté in 14 days (Feb. 1668). At the same time Louis' ambassador, Grémonville, signed with Leopold I. a

treaty by which the Spanish possessions were to be divided up between the emperor and Louis if Charles II. of Spain should die without issue. Thinking themselves lost, the Dutch roused Europe by the Triple Alliance, concluded with England and Sweden at the Hague, to prevent the occupation of Flanders. Acting on the advice of Colbert and Lionne Louis made a show of yielding, and in the Treaty of Aix-la-Chapelle secured his Flemish conquests, which were immediately fortified by Vauban (May 1668).

The Dutch War.—This experience taught Louis that the fulfilment of French aspirations in the north would necessitate the mastery of the wealthy, Protestant Dutch, without alarming the English, who still lamented the loss of Calais and grudged to France Dunkirk, which had been bought back from Charles II. in 1662. Lionne bought off Charles II. by the Treaty of Dover (q.v.) and in four years isolated the Dutch, as he had previously isolated the Spanish. In 1672, when everything was at last ready—army, finance, alliances—the war began. All would have been ended in a few weeks had not Turenne been too late in reaching Muiden, where the dykes had been broken and the country inundated, and had not the Dutch overthrown the bourgeois republic of the brothers de Witt and given the Stadtholdership to William of Orange. From that moment the whole aspect of the war was changed. William devoted his energies to stirring up enemies against Louis throughout Europe. He brought together in a coalition the emperor, the king of Spain, the duke of Lorraine, a number of the princes of the empire and England. France was obliged to evacuate and then to settle with the United Provinces, and to stand in her own defence. After five years of war, Turenne's victories in Alsace, where he was killed, those of Condé, and lastly those of Duquesne over de Ruyter at sea, resulted at Nimwegen in a partition (1678). Spain, paying for her allies, had to cede Franche-Comté and half of Flanders. While all Europe was disarming, Louis XIV. sought to make the peace a means of conquest. Acting on his orders the lawyers of the *chambres de réunion* pronounced in favour of numerous annexations in Alsace and Lorraine. Their illegal proceedings, carried out by force of arms in Belgium, aroused the indignation of Europe. But, owing to the siege of Vienna by the Turks, the emperor was helpless. Luxembourg was seized by Créquy and Vauban, and by the truce of Ratisbon Spain was obliged to surrender that town to France (1684), and the emperor acquiesced in various annexations, including that of Strasbourg. Thenceforward Louis' terrified allies avoided his clutches until the opportunity should present itself of fighting him.

War of the League of Augsburg.—At this moment William of Orange resumed the war. He had married the niece of Charles II. and was assured of the support of a powerful Protestant party in England. For his part Louis was convinced that to cease to overawe Europe was only to provoke coalitions. The revocation of the Edict of Nantes added religious hatred to political jealousy. The Declaration of the General Assembly of the French clergy in 1682, the humiliation of the pope in Rome itself by the marquis de Lavardin, in the diplomatic immunity dispute, the attempted installation by force of Louis XIV.'s candidate, cardinal Fürstemburg, in the see of Cologne—all this had alienated the Catholics from Louis. The signal for a general war was given by Louis' claim to a part of the Palatinate on behalf of his sister-in-law, the widow of the elector. The French armies devastated the Palatinate instead of attacking William of Orange in the Netherlands, thus leaving him free to land at Torbay, accept the English throne, and form the Grand Coalition of 1689. Always defeated, but ever indomitable, William was the soul of the opposition. With the exception of the elector of Cologne, Louis XIV. found united against him almost the whole of Protestant and Catholic Europe. For eight long years, despite the disappearance of Turenne and Condé, of Louvois and Seignelay, his armies fought victoriously under Luxembourg at Fleurus (1690), Steinkirk (1692) and Neerwinden (1693); under Catinat in Piedmont, at Staffarda (1690), and at Marsaglia (1693). Louis would have emerged the victor if Tourville, victorious at Beachy Head (q.v.) had not met with the naval disaster of La Hogue. Nevertheless,

Jean Bart and Duguay-Trouin inflicted further severe reverses upon the English and Dutch admirals.

Louis XIV. was the first to make tentative offers for peace, a fact that marks a stage in his foreign policy. The temperate peace of Ryswick left him Strasbourg, while it compelled him to suppress all commercial tariffs and to recognize William III. as king of England; it also gave a barrier line of fortifications to the Dutch (1697).

War of the Spanish Succession.—By signing the peace, Louis was only gaining time to prepare himself for the inevitable quarrel over the succession to the throne of Spain, for Charles II. was childless and near to death. As with the emperor in 1668, so now with William III.; in the secret treaties of the Hague (1698) and London (1699) Louis sought to safeguard the balance of power in Europe and to hold to his task of gaining her natural frontiers for France. Suddenly, on the death of Charles II. (1700), he found himself confronted with a momentous decision, for Charles had left his whole kingdom to his grandson, the duke of Anjou. After a meeting of the Great Council at Versailles (Nov. 16), Louis—who was guided in making his decision not only by dynastic interests but by the knowledge that if the Bourbons refused the succession the emperor, who had not assented to the Treaty of London, would reconstruct the empire of Charles V. to the advantage of the Habsburgs—presented his grandson to the Spanish ambassador as his king. In either case war was inevitable: it were better then to make it with and for Spain, than without her aid and against her.

The English and the Dutch, who were primarily interested in commerce, recognized Philip V., but the unwise policy of Louis XIV. was to afford William III. and Heinsius the opportunity they sought for partitioning the Spanish colonies. The assertion of the right of Philip V. eventually to succeed to the French throne, coupled with the expulsion of the Dutch from the barrier fortresses, brought about the Grand Alliance of 1701 between the maritime powers and Austria. The recognition by Louis of James III. as king of England was only in response to the Grand Alliance: but it succeeded in forcing England into the inevitable war. In spite of the death of William III. (1702) his policy triumphed. In the long war of the Spanish Succession it was no longer the names of the French generals, but those of Prince Eugène and the duke of Marlborough, which were on all men's lips. Though from 1701–03 success was equally balanced in Italy, Germany and the Netherlands, the successors of Villars (who had been sent against the Camisards) owing to the treachery of the duke of Savoy, lost Germany at Hochstädt or Blenheim (1704). In 1706 the defeats of Ramillies and Turin led to the evacuation of the Netherlands and of Italy. In 1708 the disaster of Oudenarde left the northern frontier exposed, and Dutch cannon were heard at Marly. Nature allied herself with the enemy during the terrible winter of 1709. Louis XIV. was forced to humble himself to ask for peace from the Dutch, but they forgot the lesson of 1673. Disgusted by their unwillingness to compromise, Louis for the first time appealed to the patriotism of his people at Malplaquet. And then invasion followed. Louis was saved from disaster only by his dauntless courage, the strong will of his secretary of State, Torcy, and the victory of Vendôme at Villaviciosa. The failure of the conferences at Gertruydenberg, which obliged the Whigs and Marlborough to resign their power into the hands of the Tories, now weary of the war and chiefly preoccupied in securing the mastery of the sea; the death (1711) of Joseph I., who had attempted to reconstruct the empire of Charles V. for his brother, Charles VI.; and the victory of Villars at Denain (1712)—all combined to render possible the Peace of Utrecht (*see* **UTRECHT, TREATY OF**) which sealed the Franco-Spanish defeat by giving Italy and the Netherlands to the Habsburgs, Spain and her colonies to the Bourbons, and a royal crown to the duke of Savoy and the elector of Brandenburg. Gibraltar, Minorca, the gates of Canada and colonial commerce, fell to England which, in affecting to defend the liberty of Europe, had always had the acquirement of these in view. The Treaty of Utrecht was for France what the Peace of Westphalia had been for the House of Austria—a return to the first territorial acquisitions of Louis XIV. and

an end to her hegemony in Europe. (See SPANISH SUCCESSION.)

Last Days of Louis XIV.—But it was not only the fortune of war which disappointed the old age of the Grand Monarch. The grief and misery in which his reign ended were worse than defeat. With the deaths of the Grand Dauphin, of the duke and duchess of Burgundy, and of his two grandsons, which left as his heir a frail great-grandchild of four years, it seemed as though his whole family were under a curse. The court now resembled a gloomy infirmary presided over by an old and evasive matron in the person of Madame de Maintenon. It was not merely the clamour of an exhausted people which arose against the monarch. The intellectual leaders, like prophets in Israel, denounced a tyranny which placed Chamillard in charge of the finances—because he played billiards well—and the incapable Villeroy in command of the army, while it disgraced the patriotic Vauban, banished Catinat, and exiled Fénelon. Everything conspired to make the end of the reign a glaring contrast to its brilliant opening. When one recalls Molière and Racine, Bossuet and Fénelon, the campaigns of Turenne and the statutes of Colbert, the many literary and scientific foundations, the harbour of Brest, the *canal du midi*, the colonnade of the Louvre, the Invalides, Versailles and Vauban's fortifications—admiration cannot fail to be aroused for the brilliant and magnificent age of Louis XIV. But the art and literature expressed by the genius of masters, reflected in the tastes of society, and adopted by Europe as its model throughout a century are no criterion of the social and political organization of that age. They are but a magnificent cloak which serves to conceal the ostentation and arrogance, no less than the misery and superstition, of the time; remove it, and reality appears in its brutal and sinister nudity. The corpse of Louis XIV. deserted by all save the lackeys, and greeted all along the road to St. Denis by the curses of the crowd in the cabarets—who fêted his death by getting drunk because they had suffered too often from hunger in his lifetime—such was the coarse but truthful epitaph inscribed by public opinion on the tombstone of the "Grand Monarque." And that, too, was the reason why the people hailed the accession of the handsome child whom they called Louis the Well-beloved with the joyful hope to which the future was to give the lie, and whose funeral, 60 years later, was to be greeted with the same proofs of disillusionment.

The Regency.—The death of Louis XIV. closed the great age of France: the 18th century opened upon the crisis of the monarchy, and 1715-23 was the reactionary period of the Regency, characterized by unique effrontery, innovations and frivolous immorality; from 1723-43 is remembered for the mealy-mouthed despotism of Cardinal Fleury, and his half-hearted policy, at home and abroad; while 1743-74 forms the period of the personal rule of Louis XV., with all the different powers in conflict—the bishops and the *parlement* quarrelling, the Government disputing with the clergy and the magistracy, and public opinion in declared opposition to the State; and finally, from 1774 to 1789 we have Louis XVI. with his honest illusions, his moral pusillanimity and his intellectual impotence, to aggravate still further the accumulated errors of centuries and to render the Revolution inevitable.

The 18th century, like the 17th, opened with a *coup d'état*. By his will, Louis XIV. entrusted the regency to his nephew, the duke of Orleans; but, as he disliked him, he placed all the power in the hands of a council in which his illegitimate children with Madame de Maintenon and the Jesuits held the predominant position. In thus seeking to render the regent powerless, Louis only succeeded in making him powerful. For the regent, in order to rid himself of such possible rivals in the event of a premature decease of Louis XV., sought allies in the *parlement*. In return for its declaration that Louis' will was null and void, the regent restored to it the right of remonstrance which had been suspended since 1673. On the advice of Saint-Simon he replaced the secretaries of State by six councils, largely composed of the great nobles; he also abolished the laws against the Jansenists. Highly endowed, but lacking the ability to use his talents, Orleans was presently forced to recognize the inconvenience of a hydra-headed Government, the mistake of having restored to the *parlement* a

political power they were not slow to abuse, and the vanity of his hope of achieving a religious peace. A reaction was accomplished, but not before Louis XIV.'s governmental machine had suffered gravely.

John Law.—Another event was followed by still graver consequences. The political reaction that had placed power in the hands of the regent had not made an end of the financial crisis, and only a strong Government could have dealt with one of such magnitude. The duke of Noailles, who had contented himself with outworn expedients, could accomplish nothing, when a clever Scottish adventurer, John Law (*q.v.*) offered to assist in reducing the enormous debt of three milliards and in replenishing the Treasury. The English and Dutch merchants, through the confidence that was placed in their good faith, were able to obtain plenty of credit for their bills of exchange. Why should not the same be true in France of notes issued by a royal bank? In return for a small discount the bank would pay the bills of the merchants by bank-notes which would circulate as legal tender; it would also interest itself in overseas enterprises, giving them support when necessary. With its gains it would indemnify the creditors of the State, extinguish the debt, and even eventually render taxation unnecessary. But there must be a cash reserve with which to guarantee the repayment of the notes. In 1716 Law was authorized to commence operations: he succeeded; and in 1718 his bank was transformed into the royal bank with power to issue a paper currency as legal tender. Law proposed to lighten the Treasury by the profits accruing to a great maritime and colonial company. The new *Compagnie d'Occident* was accordingly floated with a capital of 100 millions to exploit the valley of the Mississippi. The shares were eagerly subscribed; the company acquired a monopoly of tobacco and coinage, and, under the new name of the *Compagnie des Indes*, united all the privileges and the business of the old French maritime companies. His nomination as controller-general of the finances, brought Law to the pinnacle of his power. The bourse in the rue Quincampoix witnessed a frenzy of speculation; but when at the end of 1719 Law's company declared a negligible dividend there ensued a panic, followed by a suspension of payments at the close of 1720, and the flight of Law. A part of the public debt had been extinguished, and industry, commerce and the colonial enterprises had undergone a great development; but the collapse of the system killed credit; and, through the overthrow of private fortunes and the passion for gambling and easy riches, a social upheaval was effected which added further to the moral decadence of the period.

Foreign Policy.—Foreign policy underwent a similar reaction. During 1717-39 France was in alliance with her former foes, England and Holland. France, after 30 years of war, between two bankruptcies, Holland, now reinstated in her commercial position, and England, who saw before her the beginnings of her overseas empire: all three needed peace. On the other hand, peace was imperilled by Philip V. and by the emperor who, while they accepted the portion assigned to them by the Treaty of Utrecht, laid claim to the whole. A further danger was threatened by the maternal ambition of Elizabeth Farnese, second wife of Philip V., who sought Italian thrones for her children, and was aided by the efforts of Alberoni to revive Spain. It is to the credit of the commonsense of the French minister, Dubois, that a catastrophe was averted. He signed the Triple Alliance at The Hague, and next year, aided by Stanhope, induced the emperor to participate in it (1718). The intrigue between the Spanish ambassador, Cellamare, and the duke of Maine to exclude the house of Orleans from the French throne, was discovered and repressed; a Spanish fleet was destroyed by Admiral Byng and the dockyards at Pasajes burned by Marshal Berwick. The dreams of Alberoni were finally dissipated by the terms of the Treaty of London (1720).

When he attained his majority in 1723 Louis XV. left all power in the hands of his chief ministers for another 20 years. After the deaths, at an interval of four months, of Dubois and Orleans, the duke of Bourbon, great-grandson of the great Condé, took over the reins of power, only to suffer himself to be led by a worthless woman, the marquise de Prie, thus inaugurating the long reign in

diplomacy of publicly recognized mistresses and similar follies. They found standing in their way the man who had been the author of their fortunes, Cardinal Fleury, the king's tutor. Bourbon hoped to maintain himself in power by marrying Louis XV. to Maria Leszczinska. The dismissal of the Spanish infanta, who had been betrothed to Louis XV., greatly strained relations with Spain. Discontent was aroused by the new tax of the *cinquantième* imposed upon all classes of revenue, and by the revival of a persecution of the Jansenists and Huguenots which had seemed to have died out. All this was cleverly exploited by Fleury. Acting on his advice the king dismissed the duke of Bourbon in 1726.

Cardinal Fleury, 1726-43.—A typical ecclesiastic, Fleury had known how to await his ultimate success. When at last he attained to the supreme direction of government, he was already more than 70. Soft-spoken, crafty and unassuming, he was a pacifist by nature and conviction. His desire for economy led him to appoint Orry, who was his right-hand man, to the controller-generalship of the finances. A worthy successor of Colbert, and equally surly, Orry decreased expenditure and restored order to the finances. Religious peace proved more difficult of attainment. Fleury took strong measures against the Jansenist agitation. By means of *lits de justice* and *lettres de cachet* he routed out the flagellants and made an end of alleged miracles. In a few years his wise administration had re-established affluence and prosperity. His foreign policy was characterized by the same dislike of adventures. In accord with Walpole he devoted himself to promoting general peace. First of all he reconciled the descendants of Louis XIV., divided among themselves since the Polish marriage, by means of the Treaty of Seville (1729). Next the emperor, Charles VI., who desired to secure the succession to his daughter, Maria Theresa, was obliged to sign the second treaty of Vienna (1731). The sacrifice of the Ostend Company, whose competition was arousing the anger of the English and Dutch, procured the duchy of Parma for Philip's son, Don Carlos, and also the recognition of Maria Theresa's rights. Fleury believed that peace was assured; but the Polish succession question—the first of the many destined to trouble Europe for 50 years—proved him to be mistaken. On the death of Augustus II., the electoral king of Poland, in 1733, his son, Augustus III., and Stanislaus Leszczinska, father-in-law of Louis XV., offered themselves as candidates for the vacant throne. The Poles chose the latter whom, however, they were unable to support against the Russo-German coalition. Fearing English reprisals, Fleury rendered no substantial assistance to Stanislaus. Chauvelin, the secretary of State for foreign affairs, who was supported by a public opinion enraged by Fleury's pusillanimity, unable to attack the Netherlands made a diversion in Italy with the help of the kings of Spain and Sardinia. Chauvelin had checkmated Fleury with war: Fleury now checkmated him with peace, and hastened to replace the victorious generals with diplomats. By the third Treaty of Vienna (1735-38) Louis XV. gained the whole of Lorraine for his father-in-law, pending its reversion to himself, and recognized the rights of Maria Theresa. But Chauvelin was sacrificed to the cabinets of Vienna and London.

Fleury had hardly had time to breathe again when a fresh conflagration burst out in the east. The tsarina Anne and Charles VI. had agreed upon the partition of Turkey. Villeneuve, the French ambassador at Constantinople, was supported by his government in his endeavour to postpone this event; he aroused the courage of the Turks and armed them with the assistance of Bonneval (*q.v.*). The peace of Belgrade (1739), in which the capitulations (*q.v.*) were renewed and the designs of Russia and Austria checked, was a great moral and material victory for France (*see* EASTERN QUESTION).

War of the Austrian Succession.—France had become once again the arbiter of Europe when, in 1740, the unexpected death of the emperor opened a new period of war and misfortune for Europe and for the pacific Fleury. The whole of Europe had signed the Pragmatic Sanction (*q.v.*) which assured to Maria Theresa the succession to Charles VI.; but his death was followed by an almost general renunciation and an attempt to partition his inheritance. Maria's most dangerous rival was Frederick II. of Prussia, a stark

realist, who was resolved to unite the scattered portions of his dominions, and to secure for himself the hegemony in northern Germany. Silesia was Brandenburg's shield against Austria; and, without making a formal declaration of war, Frederick seized it after the victory of Mollwitz (April 1741). Seeing that Austria was no longer dangerous Fleury's inclination was not to misuse France's traditional policy by exaggeration, but to respect his sworn word. He dared not press his opinion, however, and yielded to the anti-Austrian party of the two Belle Isles—who were sick of peace, infatuated by Frederick II., and supported by the bellicose mistresses of Louis. This party brought about the League of Nymphenbourg between France, Spain, Prussia, Bavaria and Saxony for the dismemberment of the Austrian empire (1741). Fleury lived to witness the frequent treasons of Frederick II. in his own interests; the precipitate retreat of Belle Isle from Bohemia, the humiliation of France before Austria, and her isolation in Europe. The hour had come for the old Nestor, fallen into his second childhood, to depart (Jan. 1743).

The Personal Government of Louis XV., 1743-74.—Thus at the age of 33 years Louis became his own first minister and governed for himself: but nothing had prepared him for his royal task. Orphaned at the age of two, schooled in arrogance by his early tutors, ignored by Fleury in the administration because of his frail health, Louis grew to manhood in the midst of a dissolute court; indolent and egoistic he thought only of avoiding the boredom of business, of etiquette and of his neglected queen by hunting, supper-parties and spicy indiscretions. Thus he sank into sensuality and into the hands of favourites. His mistress, the duchess de Chateauroux, did indeed endeavour to arouse him to action, but she disappeared at the moment of her triumph. There followed the insolent tyranny of the little *bourgeoise* the Pompadour, and for almost 20 years her whims and caprices ruled the realm (1745-64). A prime minister in petticoats, she established her own political system, upset the time-honoured alliances of France, made and unmade ministers, commanded the army and navy, concluded treaties, and miscarried in all her enterprises. She was the queen of fashion in a society where corruption bloomed luxuriantly and exquisitely, and in a century of wit, hers was second to none. In the midst of this extraordinary instability, the mistress alone ruled on; in a reign of all-pervading satiety and tedium she managed to remain indispensable and bewitching to the day of her death. France had in truth no real interest at stake in the war of the Austrian Succession; and when, in the attempt to make a stage-emperor of the elector of Bavaria she was defeated at Dettingen by the English and Hanoverians and driven back upon the Rhine (1743), it was realized that the policy of waging war in Germany was mistaken, for the true soul of the coalition had always been England, and the attack must be made where England was most vulnerable—in Flanders. The victories of the marshal de Saxe, another brilliant adventurer, at Fontenoy, Raucoux and Lawfeld, were hailed with joy as continuing those of Louis XIV. The "disinterested" peace of Aix-la-Chapelle (Oct. 1748) had no effectual result except to destroy in Germany, and to the advantage of Prussia, a balance of power which was not yet secured in Italy, despite the establishment of the Spanish prince, Philip, at Parma (*see* AIX-LA-CHAPELLE, CONGRESS OF).

In this war France had fallen into the Continental snare laid for her by England in order to distract her from India (where Dupleix was founding an empire with a handful of men); and for the sake of conquering Silesia for the king of Prussia, Canada had been left exposed by the capture of Cape Breton. She was now to lose both India and Canada for the sake of restoring this same Silesia to Maria Theresa.

The Seven Years' War, and Secret Policy.—In 1755 England suddenly attacked France at sea, and Frederick II. by a fresh *volte-face* passed over to the English alliance. Thereupon Louis XV. allied himself with Maria Theresa in the Treaties of Versailles, by which he received the promise of the extension of the French frontier to the south of the Austrian Netherlands (1756-58). Instead of remaining on the defensive in this continental war, to which he was no more than an accessory, Louis sought to play the chief part, and permitted himself to be governed by three

women—Maria Theresa, Elizabeth of Russia, and the Pompadour. Out of this reversal of the alliances sprang the Prussian and English empires. In three battles, three victories for the enemies of France, Rosbach (1757), Plassey (1757), Quebec (1759)—thanks to the recall of Dupleix who was not returning large enough dividends to the Compagnie des Indes, and to the abandonment of Montcalm who could not interest anybody in “a few acres of snow”—Silesia was finally acquired by Frederick II., and Canada by William Pitt, who adopted also as his own the French plan for the conquest of India.

The Treaties of Paris and Hubertusburg (1763) once more revealed the fact that the French, though superb in their conceptions, were deficient in action; moreover, Choiseul, secretary of State for foreign affairs since 1758, created out of this deceptive Austrian alliance a system which set the finishing touch to disaster. After losing everything to satisfy the hatred of Maria Theresa for Frederick II., he witnessed at Neisse and Neustadt (1769–70) the reconciliation of these two irreconcilable Germans at the expense of Poland—one of the oldest adherents of France. The tardy device of the Family Compact, concluded with Spain in 1761 with a view to striking at England whose fleets were threatening the French coasts, served only to involve Spain in the disaster. Choiseul who had, at least, a policy that was sometimes right, and who strove to realize it, saw clearly that the real struggle was with England; hence he devoted all his energies from 1763–66 to the development of the navy, and, as a compensation for the loss of the colonies, annexed Lorraine (1766), while by the acquisition of Corsica (1768) he gave France a base in the Mediterranean midway between a friendly Spain and Italy, which might one day be a stepping-stone to Africa.

But Louis XV. had two policies. The efforts he made to repair, by the secret diplomacy of the Comte de Broglie, the evils wrought by his official policy, served only to aggravate his mistakes and to betray his weakness. The contradictory intrigues of the king's secret diplomacy in the candidature to the Polish throne of Prince Xavier, the brother of the Dauphin, and the patriotic efforts of the Confederation of Bar, helped to provoke the Polish crisis, which was concluded in Frederick II.'s favour by the partition of 1772. The Turks, in their turn, were involved in the same disaster. Of the old allies of France, Choiseul retained at any rate Sweden by means of the *coup d'état* of Gustavus III. (1772), but instead of being, as heretofore, the arbiter of European destinies Versailles lost all its credit, and only exhibited to a contemptuous Europe the extremity of its decadence.

Home Government of Louis XV.—These defeats and humiliations aroused further resentment in an already discontented nation, as the want of cohesion in the Government and anarchy in the central authority became more and more intolerable in home affairs. In the absence of a royal and directing hand, the king's mistresses were unable, of themselves, to animate the administration. Since the days of Fleury a public opinion had gradually grown up in the salons and cafés of Paris which became daily more embittered. It found more and more open expression among the writers, who loudly demanded reforms, and in the political opposition of the members of the *parlements*, the frequenters of the salons of Mesdames d'Épinay, Geoffrin, and Du Deffand, talk was translated into action. The Government undoubtedly still possessed traditions and civil servants of capacity who were able to protect it against the ruinous influence of the courtiers; but it was impossible to achieve reforms without affecting private interests or suppressing privileges. Thus in the absence of a firm royal power, the Government was confronted by a universal opposition, at once from the religious party and from Madame de Pompadour, who leaned for support upon the *parlement*, the Gallicans, the Jansenists and the philosophers. Apart from the court, the armies, fleets and wars cost a great deal of money. But nobody was willing to sacrifice fiscal immunity—least of all the *Parlementaires*. Hence, as in foreign policy, so in home affairs, it was the opposition that held to the past and the Government that fought for reform. In reality the Government, far from being absolute, was held in check by the *parlements* whose resistance paralyzed the administration.

Restored to their political activity the *parlements* refused to approve the plan of Machault d'Arnouville, which insisted on the right of taxation without respect of persons and arranged for the liquidation of the public debt by a tax of a twentieth; and the clergy for their part were no less selfish. Louis XV. sacrificed his minister to the clamour of the privileged classes (1754). The *parlements* intervened also, and with equal vigour, in the dispute that arose regarding the papal Bull *Unigenitus* and in the question of the *Billets de confession*. The general confusion was further aggravated by the fact that the *parlements*, which sympathized with the Jansenists, had the support of the Philosophers and of the sceptical Encyclopaedists. Two facts served to reveal the breach between the nation and the king: since 1750 the marquis d'Argenson had prophesied a revolution and Damiens, in 1757, had attempted to assassinate Louis, the Well-beloved.

After the Seven Years' War, the necessary reorganization of the army and navy, with a view to a fresh war with England, proclaimed the need of money. Choiseul had to appeal to the *parlements*. He thought that he would win them and the Encyclopaedists by obtaining Louis XV.'s consent to the expulsion of the Jesuits (1764). But the opposition to taxation steadily increased and became particularly violent in Brittany, where the estates, attached to their privileges, were supported by the *parlements* of Rennes and of Paris from 1766 to 1770. Choiseul fell in his turn in face of the coalition of the new mistress, Madame du Barry, the Abbé Terray, and the Chancellor Maupeou.

The Triumvirate, 1771–74.—The fall of Choiseul was followed by a *coup d'état* on the part of Maupeou, who gave Louis XV. to understand that in the opposition of the *parlements* lay a danger to the monarchy. Ambitious and energetic, Maupeou suppressed the *parlements* and set up in their stead superior councils of magistrates nominated by the king. The Philosophers supported this bold policy; and it was justified by the religious intolerance of the *parlements*, the scandalous trials of Calas, Sirven, the chevalier de la Barre, and Lally-Tollendal, and their selfishness in perpetuating abuses profitable to them. The Abbé Terray began to reform the abuses of revenues and pensions, to organize the famous *vingtièmes* which had aroused so great a storm, and to create an equitable system of taxation similar to the *contribution mobilière* subsequently set up by the Constituent Assembly, but in spite of it remained as unpopular as every other minister of finance.

A general unrest manifested itself throughout the nation, although no one sought to destroy either absolute power or the traditional constitution. The Philosophers, like Voltaire, and the Physiocrats sought to utilize the king's autocratic power to accomplish the necessary work of reform. Montesquieu raised his voice in praise of constitutional and benevolent despotism; and if Rousseau put forward the theory of the “social contract” and a popular sovereignty, he did not pretend that it was applicable in territories of a greater size than Geneva. These new ideas had only reached the educated classes, and formed a piquant subject of discussion among the frequenters of fashionable salons who, however, had no desire to be martyred for their beliefs. The intelligent, ambitious and wealthy *bourgeoisie* composed of farmers-general, army contractors, financiers, business men and manufacturers, aimed only at securing themselves against the arbitrary action of royalty and bureaucracy. In the face of the extravagant anarchy of the Government, they were no longer safe from bankruptcy. The peasants, whom the acquisition of land had gradually enfranchised, were, above all, eager to enjoy their new wealth. So that to Louis XV.'s cynical and despairing declaration “Après moi, le déluge,” the setting 18th century responded by a belief in progress and an appeal to the future.

Louis XVI., 1774–92.—This persistent loyalty to the Crown and this hope of reform affords an explanation of the confidence expressed anew by the nation in the 20-year old Louis XVI. He was popular on account of his virtuous private life and his good nature: but to be a large eater, like all the Bourbons, a great hunter, and a clever locksmith, was not also to grasp and be able to exercise authority. Louis was full of good intentions and confused ideas. Love of tradition and the old constitution of the

kingdom were united in his vacillating personality with a real desire for the public good and a wish to carry through reforms, even though he lacked the necessary force of character to put his desire into action. Since 1770 there lived in his company rather than at his side the Archduchess Marie Antoinette of Austria. She was one of the most beautiful and lively women at Versailles, passionately devoted to pleasure and luxury, delighting to free herself from the formalities of court life, lovable and loving without ceasing to be virtuous. But when, later on, less clever than her mother, she sought to play the part of a Queen-regnant, she gave the rein to her likes and dislikes, and very quickly afforded Beaumarchais a terrible illustration for his *Basile*. Private jealousies and public impostures soon crystallized her tremendous unpopularity in the sinister nickname of "l'Autrichienne." Neither Louis XVI. nor Marie Antoinette was capable of reconciling the nation with the throne, nor of taking the leadership in Europe; their reign was but a tissue of contradictions. External affairs appeared even less hopeful than those at home; desirous of restoring to her position in Europe a France that had been humiliated by the Treaty of Paris and the partition of Poland, Vergennes resolved to free her from the maritime supremacy of England and to throw off the yoke of Austria. The opportunity came when, in 1776, the English colonies in America rose in revolt. Vergennes desired French intervention; but Louis XVI., yielding to the financial objections of Turgot, hesitated, while countenancing the assistance given to the Americans by volunteers under La Fayette, until after the capitulation of Saratoga (1778). In order to fight against England, France needed to have her hands free on the continent. Vergennes assumed the rôle of arbiter of Europe. When the Emperor Joseph II., unable to forget the triumphs of Frederick the Great, wished to compensate himself for the loss of Silesia by the acquisition of Bavaria, Vergennes prevented him by the Treaty of Teschen (1779), thus preserving peace in Europe. Vergennes earned the gratitude of all peoples weary of the naval tyranny of England by the Franco-Spanish-Dutch alliance (1780) and, after the capitulation of Yorktown, by the Treaty of Versailles (1783) which crowned his efforts with formal success. Henceforth, partly from want of money and partly from his own natural caution, Vergennes contented himself with maintaining the *status quo*—a difficult ideal in the face of the desire of Catherine II. and Joseph II. to partition the Ottoman empire; he sought to crown his work by effecting a reconciliation between France and England in the commercial treaty of 1786, and when he died in 1787 his plans had been realized. But his work was quickly destroyed by the very means taken to ensure its success: his American war had but hastened the "hideous bankruptcy."

The Home Government of Louis XVI.—From the outset of his reign Louis XVI. displayed in home affairs the indecision that was to cost him his throne. In an extreme of inconsistency, and in order to please public opinion, he restored the *parlements*—the merciless enemies of reform—at the very moment when he summoned the reformers to his Council. Of these Turgot was the most remarkable; Physiocrat and contributor to the *Encyclopædia*, he wished to extend to the whole of France that experiment in liberty which had already succeeded on a small scale in the government of his own province of Limousin. He ordained the free circulation of grain throughout the kingdom despite the flour war (*la guerre des farines*) aroused by the prejudices of those who saw in this measure a new "*pacte de famine*." For the *corvée* which had taken away the peasants from their work in order to build roads, he substituted a territorial levy, payable by all landowners; and he established freedom of commerce and industry by abolishing the privileged trade corporations (1776). He offered himself to Louis XVI. as a minister of economies: there were to be no new loans and no new taxes. But time failed him. He had been 13 years at Limoges; he was a minister for only two years. The two supports on which he had a right to count failed him simultaneously; public opinion that clamoured for reforms on condition of not paying the cost, and the king who was too weak to put down abuses or to refuse privileges. The *parlement* was induced to register his edicts only by force; the court, the clergy, the financiers—one and all joined in maligning him; and when, in

order to decentralize the too centralized administration, he proposed to set up consultative bodies of landowners in each parish, town and province, Louis XVI. sacrificed him to the intrigues of Maurepas and to the American ambitions of Vergennes (1776).

Necker, the Genevan banker and Protestant, succeeded him. He abolished the Turgot edicts and then, either because he dared not or could not attack the evil at the root, proposed, like Law, a marvellous remedy: an unlimited loan. He succeeded in financing the American war, but at a grave charge upon the future. His administrative work showed no greater signs of originality, and borrowed largely from the ideas of Turgot. He transformed the municipal bodies set up by Turgot into provincial assemblies, heirs of the *parlements* and the intendants, and immediately they assembled they revealed themselves to be inspired with a reforming spirit—while opposition on the part of the privileged classes broke out again. Necker replied with his famous *compte-rendu*, showing that the monarchy rewarded the idleness of the courtiers far better than it had ever rewarded the zeal of its servants; but in 1781 he in his turn was overthrown by the reaction which he had helped to promote in attacking Turgot. To the reforming ministers succeeded ministers who were courtiers only. The Marquis de Ségur removed from the army all officers of low birth, while the nobles displayed a fierce energy in enforcing their seigniorial rights; the Church reasserted more strongly than ever its sovereign right to control the civil estate of all Frenchmen; but the reaction was not able to fill the empty coffers of the State, and in two years, two ministers, Joly de Fleury and d'Ormesson, were discarded. Calonne, a business man, a veritable Cagliostro of finance, succeeded. Madly extravagant, he feigned an optimism which nourished the confidence necessary to ensure the success of his perpetual loans; but, like his predecessors, he experienced the enmity of the *parlements*. After two years of combat, realizing that Louis XVI. would never consent to a repetition of the *coup d'état* of 1771, he sought the support of a national suffrage; and it was on his advice that the king summoned an assembly of notables, thus exposing the monarchy at a time when it was already compromised by the affair of the Diamond Necklace (*q.v.*).

Loménie de Brienne, who succeeded Calonne in 1787, was no more successful. The notables referred him to the representatives of the people, to the States-General. But Brienne, remembering Etienne Marcel and the League, preferred to present to the *parlements* his edicts for a stamp duty and a territorial subsidy. He met with the same refusal, and was referred again to the States-General. Against his own wishes, Louis XVI., by his declaration of Nov. 19, 1787, was forced into open warfare with the *parlements* which he had re-established—a battle in which the king was to be the loser, for the royal Government was too exhausted to overthrow even a decaying power like that of the *parlements*.

THE REVOLUTION

The Revolution began in the same manner as the Fronde. This time, however, it was the nobles and the magisterial aristocracy of the provinces who gave the signal for the revolt. In Brittany and in Béarn the estates supported the *parlements*, and it was in Dauphiné, at Vizille, on July 21, 1788, that the first demand was made for the convocation of a States-General. The clergy, in their turn, having also refused the subsidy, Louis was forced to give way and to summon the States-General to meet on May 1, 1789. But the Government had to be carried on and Necker was recalled, no one understanding less than he that he was called upon to prepare the way for a revolution. Necker was occupied solely with new financial devices; the *parlements*, with the old reactionary formula of the estates of 1614; the throne, as on former occasions, was becoming the arbiter in the battle of interests between the privileged orders and the lower classes. No one saw that public opinion was looking for something entirely different and that now it had a means of expression which it had hitherto lacked; the conflict was no longer between the Government and the privileged classes, but between the privileged classes and the people.

The States-General of 1789.—A twofold question demanded

solution: the number of deputies and the system of voting. The Vizille programme, voting by heads and the double representation of the third estate, meant equality, the great revolution; voting by orders, on the other hand, would have meant the continued domination of privilege, and the lesser revolution. The monarchy in its isolated position held the balance so long as it was ready with a definite policy. But that was much to ask of Necker, who had little influence at court, and of Louis XVI., who was torn between his minister and Marie Antoinette. Ultimately the king took the attitude that was least in accord with his real interests and most with his natural indolence: he remained neutral. At a council of Dec. 27, 1788, and despite the sensational pamphlet of Sieyès, *Qu'est-ce que le Tiers Etat?*, he separated the two questions which were so closely connected. He pronounced himself in favour of the double representation of the Third Estate, without deciding on the question of the vote by heads, although allowing it to appear that he would prefer the vote by orders. The same indecision revealed itself in the general programme; the proclamation summoning the States-General spoke vaguely of "the establishment of lasting and permanent order in all branches of the administration." The same spirit of compromise marked the choice of the meeting-place; compelled to choose between the too-distant centre of France and the too-turbulent Paris, Louis chose Versailles "because of the hunting." The manner of the elections followed the traditional procedure of 1614, that is to say, the suffrage was almost universal. For the third estate nearly all citizens over 25 years old voted and paid a direct contribution. The country clergy were included among the ecclesiastics; the smaller nobility among the nobles; and, finally, protestants were both electors and eligible.

There was equal confusion in the customary documents (*cahiers*), containing lists of grievances and proposals for reform. Although the whole of France still appeared as devoted to the monarchy, autocracy was unanimously condemned. All the orders were agreed in demanding a written constitution, the regular convocation of the States-General to vote taxes and to legislate, and equality of taxation; and all condemned the existing financial system. But the privileged classes denied equal rights for all citizens and hotly defended the system of voting *par ordres*, in which they recognized the safeguard of their tithes and feudal rights. The noblesse and the third estate gladly offered up the ecclesiastical properties, as a cheap way of settling the national debt. Although the third estate was united as against the noblesse, its demands varied with the constituency—bourgeois or peasant, traders or artisans; it was, however, the wealthy and propertied middle-classes who actually drafted its demands; they allied themselves with the feudal lords as against the poor peasants, and they were far from unanimous in their condemnation of the corporations. Where they were in agreement among themselves was in favouring as light taxation as possible, and in condemning indirect (the most productive) taxation—a line of action which was to provoke worse financial embarrassments than those they sought to escape.

The States-General and the King.—The elections had shown the opinion of France unmistakably: but Louis XVI. did not wish to rule as a constitutional monarch like the king of England, nor did the privileged classes wish to sacrifice their ancient traditions. Influenced on the one hand by Necker, who advocated the making of whatever sacrifices might be necessary, and on the other by Marie Antoinette and the comte d'Artois, who were the advocates of a policy of no surrender, the king was unable either to choose or hold to a definite course. When the estates met on May 5, 1789, he had decided nothing; and there followed a conflict between king and assembly over the verification of their mandates. The third estate desired a common session of the three orders, the effect of which would be to suppress class distinctions and secure the system of voting by head. The privileged orders refused to assent to this course, and after a delay of six weeks, during which the Third Estate firmly maintained its view, the latter, seeing that they represented 96% of the population, finally determined on the motion of Sieyès to proclaim themselves the representatives of the nation and, as such, authorized to make

laws of their own volition. The first resolution passed by the third estate in its new capacity as a national assembly, was a declaration that for the future no tax should be levied without its assent. Urged by the privileged orders, the king replied to this action of the third estate by closing the Salle des Menus Plaisirs, where they were sitting. Whereupon, gathered in one of the tennis courts at Versailles on June 20, under the presidency of Bailly, they took an oath never to separate until they had established the constitution of the kingdom.

Louis then determined to make known his policy in the *lit de justice* of June 23. He announced that he accepted fiscal, but not social, reforms; but he added that he desired the welfare of his people. Then he annulled the meeting of the 20th and ordered the estates to deliberate separately. The third estate refused to obey and, in the speeches of Bailly and Mirabeau, brought up the question of the legality of the revolution. The refusal of the military to march against them revealed that the king could no longer rely upon the services of the army. A few days later, when the lesser nobility and the humbler clergy joined the third estate, whose cause was theirs, the king yielded and commanded (June 27) the two orders to join with the third estate in the National Assembly. By so doing he recognized and sanctioned the political revolution; though at the same time under the influence of the "infernal cabal" of the queen and d'Artois, he appealed to the still loyal foreign regiments, and dismissed Necker. Fearing that an attempt would be made to overcome them by force the Assembly demanded the withdrawal of the troops; on the king's refusal Paris offered a municipal guard to protect the Assembly against the royalist forces, and by storming the Bastille, which symbolized the *ancien régime*, assured the victory of the Revolution (July 14). The king was forced to recall Necker, to place the tricolour cockade in his hat in the Hôtel de Ville, and to sanction the appointment of Bailly as mayor of Paris, and of La Fayette as commander of the National Guard which, by remaining armed after the victory, was later to dominate both king and Assembly. Since June 20 the National Assembly had had right on its side; after July 14 it had might as well. The Revolution was accomplished.

Anarchy in France.—If Paris had captured her Bastille, it still remained for the towns and villages to capture theirs—the bastilles of feudalism. Through force of example, poverty and fear, a spontaneous outburst of anarchy dislocated all authority, and on its ruins temporary local bodies arose, limited in area, but none the less defiant of the Government. The provincial assemblies in Dauphiné and elsewhere gave the signal, and numerous towns, imitating Paris, set up municipalities and national guards to take the place of the intendants and their deputies. While the middle classes were thus arming themselves and boldly assuming the local government the peasants were not idle. Between March and July more than 300 agrarian riots swept away the feudal idea of property, already compromised by its own excesses, but the middle classes possessed sufficient perception to realize that by permitting the expropriation of the nobles they endangered the revenues of their own lands. In the dismayed Constituent Assembly, the Third Estate was, therefore, not the least zealous in advocating methods of repression. But repression could only be effected through the king; it was for him to find a way to check the revolution.

In the session of the night of August 4 the liberal nobles, such as the dukes of Aiguillon and Noailles, in order to find a way out of the impasse, proposed the suppression of all personal services and fiscal exemptions, and the purchase of the seigniorial dues. The peasants did not understand this laudable but unworkable distinction between personal servitude and the rights of contract, but the idea of purchase reassured the deputies, and in the additional laws passed in order to organize it the latter endeavoured to narrow the scope of the Revolution. Amidst the joy inspired by this social liberation, Louis XVI. regained his personal popularity; but he failed to take advantage of it. With the worst possible grace, he ratified the decrees of Aug. 4, and, while fearing La Fayette who, as commander of the National Guard, was in a position of strength, he sought to control him. Above all he

sought to profit by the dissensions that daily manifested themselves in the Assembly during the discussion of the Declaration of Rights and later of the Constitution. Public opinion was disquieted by the king's hesitation in ratifying the decrees and the Constitution; and in the meantime a serious food shortage had arisen in Paris. The emigration of the privileged engendered unemployment among the workers, and there was talk of another military *coup d'état*. A final imprudence hastened the explosion. It was rumoured that at a banquet given by the officers of the guard at Versailles, the latter had failed to drink to the prosperity of the nation. On the night of Oct. 5-6, a Parisian mob forced the king and the royal family to return to Paris. The events of these days suddenly placed the king and the Assembly in the power of La Fayette, a new mayor of the palace, and of the commune of Paris. Henceforward the master of the commune was to be master of the Government. The capture of the Bastille had given the signal for the flight of the princes; the events of October prompted the flight of the royalists, and of Mounier, the leader of the reaction.

The Assembly.—Absorbed in the formulation of peaceful laws the Constituent Assembly thus found itself plunged into violent activity through the people's fear of betrayal and the court's fear of destruction. Confronted with the opposition of a Right that was composed of talented men, the Assembly sought allies in the party of the Left; in the violent press conducted by Camille Desmoulins and Marat; in the demonstrations from the tribunes and the processions that wended their way past its bar; in the clubs, above all in that of the Jacobins (*q.v.*), and in the popular associations, and, finally, in the National Guard which under La Fayette, was less desirous of keeping order than of preserving the Revolution.

By their personal influence and popularity, two men sought to act as mediators between king, Assembly, and people; and, by serving both the court and the revolutionaries, to attain to power. These were La Fayette and Mirabeau, who were jealous and hated each other. The former, on the morrow of the days of October, cleverly contrived to throw the responsibility upon the seditious party, led, so he insinuated, by the duke of Orleans. Relieved of the embarrassment of Orleans' presence through his flight to London, La Fayette advised the king to be reconciled frankly with the Revolution, and to break off relations with the *émigrés* and the followers of the *ancien régime*. If the king would have confidence in him, he would guarantee to restore order. But Louis XVI. could not forgive him for his former rebellion, nor for his present loyalty to constitutional government; he refused to give up an iota of his rights, and schemed to rid himself of La Fayette.

Endowed by nature and by industry with rare abilities, possessing a finer political capacity than La Fayette but also an irremediable lack of character, Mirabeau sought to check and dam up the Revolution; it was his ambition to be its first minister and the saviour of the monarchy. He foresaw the battle for popularity between La Fayette and the Assembly, the counter-effect upon the Revolution of revolutionary violence, possibly of civil war and, above all, of corruption. He himself received money for his services. He gave the king wise counsel: but the king did not understand it, or at least he never followed it. The queen consented to negotiate with so distrusted a servant only because it was necessary to endure everything in order to gain everything. All hope of his being entrusted with the conduct of affairs was shattered when the Assembly passed a law forbidding its members to become ministers.

The Declaration of the Rights of Man.—Having failed to come to an understanding with the king the Assembly ended by working alone, and turned its power of control into an instrument of strife rather than one of co-operation. It inaugurated its legislative work by issuing the Declaration of the Rights of Man and of The Citizen, which was inspired by all the philosophy of the 18th century and by Rousseau's *Contrat Social*. It set forth ideas of the sovereign right of the nation, and of the natural and imprescriptible rights of liberty, equality, ownership, voting and control of legislation and taxation, trial by jury, the vindication

of the ideal and the dignity of mankind. Lacking the support of historical precedents such as were to be found in England or the American colonies the Assembly took as the basis for its labours the tradition of all the great political thinkers. And it is this very universality that, despite its omissions, has made of that work a magnificent chapter of public right and the source of all the political progress that has since been achieved in the world.

The Constitution.—On this basis the Assembly founded the new régime. Assuming to itself the right of sovereignty the nation proceeded to delegate it in accord with Montesquieu's theory of the separation of powers. The executive power was awarded to a "King of the French," and was to be exercised under his authority by responsible and dismissible agents. The legislative power was to be exercised by a single chamber of 745 members, freely chosen by electors, primary and secondary according to a property qualification; the laws which it passed could be vetoed by the king, but only during two consecutive sessions. The judicial power in civil causes was to be exercised by judges elected for ten years by the same electorate as chose the deputies, and in criminal cases by two juries one, like the grand jury in England, to bring accusations and one to judge them—in a word, by the nation itself.

Organization.—Upon the same principle the Assembly swept away the entire ancient ecclesiastical and civil administration in a fury of reaction against the oppressive and inefficient centralization of the *ancien régime*. After this clean sweep they built up a new edifice on a plan at once federal, logical and simple. The old local divisions were replaced by 83 departments, with the object of crushing any spirit of particularism and of bringing together the administered and the administrators. To check the ministry, they loosened the bonds uniting local with central authorities, and against the retrograde central power gave extended powers to local bodies such as the councils and committees of communes, districts and departments. In 1791 France was pulverized into innumerable administrative atoms incapable of cohesion, and the impossibility of an immediate restoration of public life led to the hegemony of Paris in France. Since it was the educated middle class who were the sole masters, by virtue of the electoral law, municipal life, like political life, was legally concentrated by the property qualification of the franchise in the hands of the middle classes. In place of the former *parlements* there arose a hierarchy of jurisdictions rising from the cantonal justice of the peace through the civil tribunal of the district, the criminal tribunal of the department, the court of cassation in Paris, until it reached the supreme national court—all being independent of the king and his ministers.

Having abolished financial as all other privileges, the Constituent Assembly established a just and equitable fiscal system. They also abolished the *impôts de consommation*, unpopular because they bore with equal force upon unequal incomes. Owing to their horror of tyranny and of personal taxation and strongly under the influence of the Physiocrats (who in theory were in favour of a single tax on land), they placed, as a form of direct taxation, a very heavy duty upon incomes derived from landed property, a far lighter duty upon those derived from personal property, and a license fee upon receipts from commerce and industry.

The re-organization of the State necessitated that of the Church. This was achieved in the Civil Constitution of the Clergy (July 12, 1790). The clergy were to be no more than civil servants, elected like any others, entrusted with a public service and paid by the State. There were to be no more monastic vows or papal rights of spiritual investiture; the Church was disestablished and the priests, deprived of their civil rights, were compelled to take an oath to the Constitution. The Assembly destroyed the political organization of the Church in France, loosed the bonds that tied it to Rome, and attached it by the system of election to democratic interests. Political and religious reform, however, was of no avail unless accompanied by financial reform: the Assembly was powerless in face of the deficit that had been further aggravated by the Revolution. Moreover, the clergy possessed very considerable landed estates; but only by

right of temporary possession, the Assembly argued—a view which had already been advanced by the States-General in the 16th century. The suppression of the clerical order resulted naturally in the secularization of its property, which was handed over to the nation in its capacity of heir to the possessions as well as to the sovereignty of the king. Moreover these estates would serve as collateral for the *assignats*, or mortgages, and would help to liquidate the debt. The *noblesse* were also suppressed with all their rights, privileges of birth and entailed estates; the workmen's corporations, too, had disappeared, and Chapelier's law (1791) forbade any renewed combination on their part. Finally the army was to be recruited by voluntary service, its strength was each year to be regulated by the Assembly, and a military career was to be open to all citizens.

Thus the constitution of 1791 was a middle-class instrument directed against the king and the privileged orders. The *bourgeoisie* were not wholly dominated by theory; their policy was a mixture of expedients both revolutionary and conservative. Nowhere did they carry their political principles to their ultimate conclusion. The suspensive veto, the electoral property qualification, freedom of worship (offset by the Civil Constitution of the Clergy), the grant of the vote for coloured races without the enfranchisement of slaves, the organization on parallel lines of the army and the National Guard, education and poor-law relief—all these measures serve to show that their solution of the political, as of the social, problem had been no more than a compromise between traditions and principles in order to safeguard the period of transition. Such as it was, the Constitution contained durable elements in its principles and its civil institutions; its less durable elements were due to the parliamentary inexperience of the Constituents and to their hatred of the *ancien régime*. As Mirabeau's keen vision had foreseen, the separation of the three powers led to suspicion between them and, in the long run, to the encroachment of the legislative upon the executive power. This latter was gradually reduced to impotence, and was, as it were, suspended in mid-air with a monarch rightly held in suspicion, if not absolutely powerless, *vis-à-vis* the assembly and the local authorities. In an old-established monarchy entirely dependent on the central authority, the anarchy and irresponsibility due to this system of collective and elective self-government soon made it impossible to collect the taxes and led to an undue reaction against the system. The distinction between active and passive citizens, according to whether or not they paid a direct contribution equal to three days' labour—a distinction which Robespierre had vainly opposed—violated in favour of the wealthier classes equality, the first principle of the Declaration, and destroyed for 50 years the solidarity of the middle classes and the proletariat. Finally, by seeking to constitute a national Church deprived of its lands and privileges—as devoted to the Revolution as formerly to the monarchy—they uprooted the existing Church, and drove it either into ultra-montanism or heresy. The rigorous application of the penal laws against the non-juring priests provoked a religious war that strengthened the royalist insurrections at the very moment when the inadequacy of the direct taxes was aggravated by the colossal blunder of the *assignats*.

Flight of the King.—The anniversary of the fall of the Bastille was chosen for a celebration of the new unity of France, and to it came representatives from all the departments for the purpose of taking an oath to the Constitution, thus ratifying in the name of France the work of the Assembly and giving, by their voluntary acceptance of it, a formal consecration to the unity and indivisibility of their country. But Louis XVI. was unwilling or unable to speak the words which, at this unique and fleeting opportunity would have served to dissipate all doubts. That he did not do so is to be ascribed to the fact that the court had not lost all hope of a turn of fortune. True to the double game it had played between Mirabeau and La Fayette, the court party had secretly formed a coalition of the *émigrés*, reactionary clergy and foreign sovereigns. When to the expropriation of his legal powers the Assembly added the Civil Constitution of the Clergy which wounded Louis in his conscience as a Christian, and

when by the emigration of the noblesse and the death of Mirabeau (April 2, 1791) he was deprived of his natural supporters and his sole counsellor, the king bethought himself of his former project of taking refuge with the army of the marquis de Bouillé at Metz. Thus, in the face of mutiny, he substituted a perilous deception for the military violence which he could not impose, and to duplicity he added treason. The flight to Varennes (June 20, 1791) was an irreparable mistake which, during the king's absence and even on his return, displayed the insignificance of the royal authority.

The massacre at the Champs de Mars by La Fayette of the republicans who had logically enough demanded the deposition of the king (July 17, 1791) led to an open breach between the middle classes, who favoured compromises, and the democratic party. Hence, when Louis XVI. was brought back a prisoner and—with mental reservations—took the oath to the Constitution on Sept. 14, 1791, the dissatisfied nation abandoned the Constitution and took up arms against the duplicity of the monarch and the selfish policy of the middle classes. The battle between the National Assembly and the *ancien régime* had ended in the defeat of the latter. Through boredom or want of interest, the Constituent Assembly decided, on the motion of Robespierre, that its members were not eligible for re-election. This step involved leaving to still more inexperienced hands the task of putting the new constitution into force.

The Legislative Assembly.—The life of the Legislative Assembly (Oct. 1, 1791–Sept. 20, 1792) was equally short and troubled. Its days were occupied in a struggle with the king who intrigued against it: as a result the monarchy, insulted by the proceedings of June 20, was eliminated altogether by those of Aug. 10, 1792. Only in conditions of peace could the measures of the Assembly have prospered; instead they encountered war (April 20, 1792).

The majority in the new Assembly favoured the constitutional monarchy and a bourgeois franchise. But these "Feuillants" of the anti-demagogic club (*see* FEUILLANTS, CLUB OF THE), which had seceded from the club of the Jacobins (*q.v.*) after the flight to Varennes, were divided into two opposing sections: that of La Fayette and that of the triumvirate of Alexander Lameth, Duport and Barnave. They agreed only in their opposition to the republic and to war, and were, therefore, in violent antagonism to Robespierre's Jacobins, who were drawn from the lower middle classes. These small shop-keepers were greedy of acquiring national properties and were, consequently, in order to raise the value of the currency and the *assignats* which had been lowered by the intrigues of the noblesse and the priests, determined to end those activities and obtain the recognition of the Republic from monarchical Europe. Among the Jacobins the dominant group was the Girondins, so called because their most brilliant leaders, Brissot and Vergniaud, were deputies for the Gironde. (*See* GIRONDISTS.) The Republicans, however, were stronger outside than within the Assembly. Their strength was derived above all from the great popular club of Paris, the Cordeliers (*q.v.*). Vacillating between the Feuillants and the Jacobins stood the Independents, who believed in the Revolution but were as greatly disquieted by the demagogic factions as by the court intrigues. Hence the Constitutionals found themselves between two separate conspiracies, that of the royalists pure and simple, and that of the republicans, who joined hands in opposing the moderate party without surrendering their hatred for each other. The first result of this coalition was the election of the Jacobin Pétion to the mayoralty of Paris, against Bailly, the resigning mayor, and La Fayette. But the republic could not be established without war—a war against the House of Austria, the ally of the king. The Left of the Assembly (Brissotins and Girondins) against the wishes of Robespierre, were eager for war on the ground that it would be easy and that it offered the sole means of escape from the present confusion; the followers of La Fayette, militarist in spirit, lent it their support in the belief that with an army behind them, they could master both the Jacobins and the king; Louis XVI. and Marie Antoinette accepted it in the secret hope that France would tremble when

monarchical Europe took to arms.

The Declaration of Pilnitz.—The *émigrés*, who were collected at Trèves under the leadership of the prince de Condé, let loose the national and European war. The Declaration of Pilnitz (Aug. 27, 1791), by which the emperor Leopold and king Frederick William II. of Prussia declared the restoration of order and the monarchy an object of interest to all sovereigns, was put forward by them as an assurance of forthcoming support. The Girondins immediately took advantage of this to confound the Feuillants with the court in public opinion, and to denounce the king as the accomplice of foreign powers. In carrying through the Assembly the decrees against the Comte de Provence, the *émigrés*, and the reactionary priests, they forced Louis to declare himself by the exercise of his veto (Nov. 1791), thus removing the last doubts of his complicity. The indictment of De Lessart, minister for foreign affairs, led to the replacement of the Feuillant ministry by the Girondin cabinet of Brissot and Roland. On the refusal of Francis II., the new emperor, to disavow the Declaration of Pilnitz, Louis sanctioned a declaration of war upon him (April 20, 1792).

Brissot and his friends had attained to power; but only a swift and decisive victory would enable them to retain it. When however, owing to the disorganization of the army by desertion and emigration, the mismanagement by the Feuillant generals of their ill-conceived campaign in Belgium was followed by the invasion of France and the risings in La Vendée, the whole nation rightly suspected the existence of treason. To reduce the strength of the enemy within the gates, the Assembly voted the deportation of the non-juring priests, the replacement of the king's constitutional Guard by a body of 20,000 volunteer national guards in Paris, and declared itself to be in permanent session (May 27–June 8, 1792). The veto of Louis XVI. caused the fall of the Girondin cabinet, and with them of Dumouriez, who had hoped to supplant them. Cleverer than the Feuillants, who had allowed themselves to be compromised by their court connections, the Girondins diverted the storm of popular fury against the king. The *émeute* of June 20, a burlesque which, but for the persistent good humour of Louis XVI. might have been a tragedy, alarmed but did not overthrow the monarchy. But the invasion of the Tuileries provoked among the middle classes and in the commander of the National Guard, La Fayette, a spirit of monarchist reaction which might have achieved much had not the entry upon the scene of the Prussians, allies of the Austrians, and the publication of the insolent manifesto of Brunswick, served to unite temporarily the Brissotins and Jacobins. By proclaiming that the country was in danger (July 11) the Assembly revealed to France that the king was no longer capable of defending her against a foreign enemy. The summoning of the federal volunteers to Paris gave the opposition not only the war song "the Marseillaise," but also the army that had been refused by the defenceless Louis XVI. The foolish measures taken by the distracted Girondins to effect a last reconciliation between the king and the revolution, the stupid decree by which the Assembly exonerated La Fayette (Aug. 8) who had been guilty of deserting his army, its refusal to vote for the deposition of the king, the secret intrigues of the court—all this provoked the communal insurrection of Aug. 10 led by Robespierre and Danton against the king and the Gironde. At a single stroke the tocsin of Aug. 10 sounded the death-knell of the middle-class régime and the accession of democracy to power.

Insurrection of the Paris Commune.—The king having been suspended from his functions and imprisoned in the Temple, the Assembly, as after the flight to Varennes, temporarily assumed the royal authority by means of a provisional executive council presided over by Danton, in which the Girondins (Roland, Clavière, Servan, Lebrun) were in the minority. But the alliance of the mob is always dearly bought. The council found its authority quickly offset by one of those new powers, insurrectionary and demagogic in character, which on many occasions in the coming century were to rise against the legal government—the revolutionary commune composed of the delegates of the administrative divisions of Paris. They had led the assault on the Tuileries and they remained, until July 27, 1794, one of the dominant powers in the State. Established in the Hôtel de Ville, they sought to exercise a dictatorship,

entering into a conflict with the Assembly, which they looked upon as a temporary organ of power, and paralyzing the action of the executive council, notably in the bloody days of the September massacre. These were provoked by the discovery of the intrigues between the court and foreign powers, by the treason of La Fayette, the capture of Longwy and investment of Verdun by the Prussians (Aug. 19–30), and, finally, by Marat's incendiary placards. Danton was compelled to avoid a conflict with the commune. Luckily, on the day of the dissolution of the Legislative Assembly, Dumouriez relieved France of the Prussian invasion by the victory of Valmy (Sept. 22, 1792); but before it dissolved, being without a mandate to alter a constitution that had become unworkable through the suspension of the king, it had convoked a National Convention and substituted universal suffrage for the property qualification. Meanwhile, republicanism, under the influence of the Jacobin propaganda and the tide of patriotism aroused by the invasion of France, was steadily gaining strength. The decree of Aug. 25, 1792, which marked the destruction of feudalism, now abolished in principle, finally converted the peasants to the republic.

No sooner was the Convention fully established than it became distracted by the fratricidal disputes of its adherents (Sept. 22, 1792–Sept. 4, 1797). A great majority of the electoral assemblies wished for a democratic and equalitarian republic, but that it should be liberal, unitary and propagandist. The 782 deputies in the Convention were divided less by principle than by ambition. All wished to achieve an unattainable unanimity through agreement, but being unable to convince, they destroyed one another.

The Parties.—The Girondins played in the Convention the part of the Feuillants in the Legislative Assembly. But they never formed a disciplined party (their whole policy was against it), and this led to their ruin. Oratorically, they represented the spirit of the south, and politically the ideas of the middle classes in opposition to the democracy which they despised, although making use of it. They advocated a centrifugal, rather than federal system of government out of hatred for the preponderance of Paris, which had disgraced itself in their eyes by the massacres of September and by choosing deputies exclusively from the Mountain (the name given to the extremists of the Jacobins) which was no more a united and stable party than was the Gironde. They were supported by the Parisian mob, and they saw in the decentralization advocated by the Girondins, a threat to the unity of the republic at a moment when the circumstances demanded a highly centralized and powerful government. To the Polish republic of the Gironde, they opposed a republic on the Roman model. Between these two parties stood the *Plaine*, the *Marais*, the troop of trembling bourgeois sincerely attached to the revolution, but timid in the defence of their beliefs. Some among them sought a refuge in the work of the commissions, while others, through fear, or for political reasons, identified themselves with the excesses of the Jacobins.

The Girondins were the first to take the lead. Fortune smiled upon them. Invasion was turned back and the offensive taken on every front. The commune of Paris was made more moderate by the defeat of the Mountain in the elections. Everything conspired to favour the substitution of a healthy competition in patriotic endeavour for the sterile party conflicts. But the Girondins remained an exclusive party, a product of the *émeute*, but with no influence over the mob. The party lacked both a leader and popular support; it could have found both by accepting the advances made to it by Danton, but through hatred for the authors of the September massacres and above all because they saw in him their most formidable rival, the Girondins repulsed Danton and drove him back into the arms of Robespierre, Marat and the commune. After Sept. 23 they declared Paris to be a danger to the Convention and demanded the protection of a guard raised from the 83 departments. The Mountain replied by decreeing the unity and indivisibility of the republic, in order to emphasize the suspicions of federalism which weighed against the Girondists.

When the impeachment of Robespierre and the Septembrists missed fire, the Mountain replied by the trial of the king. His execution was to be the test of republican sincerity. Caught

between its horror of bloodshed and its fear of seeming suspect, the Gironde sought a way of escape in an appeal to the people which was rejected under the pressure of the crowd. On the question of the death penalty, they were divided among themselves. Morally weakened by the execution of Louis XVI, the Gironde was still further enfeebled by the course of events abroad; only by military success could it maintain itself in power. When the natural frontiers, regained in the autumn of 1792, were lost in the spring of 1793, the Gironde was doomed. The fighting spirit of the Revolution, stimulated by republican propaganda and by the old royalist tradition of natural frontiers, found expression in the decree of Nov. 19 extending protection to all oppressed peoples, and by that of Dec. 15 in which a preliminary condition of that protection was declared to be the revolutionary dictatorship of France.

The First European Coalition.—The invasion of Belgium by Dumouriez after his victory at Jemappes (Nov. 6, 1792) and the occupation of Antwerp (Jan. 21, 1793), rather than the execution of Louis XVI. (Jan. 21, 1793) brought about the European coalition of which England was to be the inspiration until Waterloo. The defeats in Belgium and on the Rhine coupled with the clerical and royalist rising in La Vendée embittered the struggle between the Gironde and the Mountain. Each accused the other of treason. From fear of the populace, the Gironde voted for the creation of a Revolutionary Tribunal to try suspects, but through jealousy of Danton it refused his proposal to set up the strong government necessary to conduct the war (March 10). This was the first of the exceptional measures which were ultimately to destroy the party. As the insurrection in La Vendée continued to grow, and Dumouriez to retreat, the death penalty was decreed against *émigrés* and refractory priests. Dumouriez's treason in deserting to the Austrians lent substance to all the popular suspicions. The provisional Executive Council gave place to the Committee of Public Safety, omnipotent in all but financial matters, a measure agreed upon because the Girondins meant to control it; but Danton got the upper hand (April 6).

Conflict Between the Gironde and Commune.—Discredited in Paris, the Girondins redoubled their efforts in the departments in order to defeat their rivals. They impeached Marat, who was acquitted, and they turned upon the Paris Commune by seeking to quash that anarchical body and by arresting Hébert. The Jacobins for their part loosed against the Gironde, whom they accused of federalism and royalism, the Parisian mob which was weary of the increasing depreciation of the *assignats*, the scarcity provoked by the law of the maximum, and the ill tidings from La Vendée and Lyons. There followed the "moral insurrections" of May 31 and June 2 in which Marat himself sounded the tocsin, and Hanriot, at the head of the army of Paris, surrounded the Convention, humiliating it, just as on June 20, 1792, the monarchy had been humiliated.

The insurrection in Paris was answered in the provinces by a federalist insurrection to avenge the national representation. Sixty-nine departmental administrations protested against the violence done to the Convention, but the ultra-democratic constitution of 1793 took away all legal power from the Girondins who were arming themselves in the west, south, and centre of France. It promised the departments, which were jealous of the dictation of Paris, the referendum, universal suffrage, and entire freedom of worship, and public opinion, which understood little of these parliamentary quarrels and was preoccupied with the question of national defence, abandoned the Gironde to its fate. The Girondins failed to excite enthusiasm in anyone save Charlotte Corday, who, by killing Marat, set the seal upon their doom. The battle of Brécourt marks the defeat of a party without foundations and a staff without troops (July 13). On Oct. 31 the remnants of the Girondins passed to the guillotine at the same time as Marie-Antoinette. At bottom, the Girondins were separated from their opponents by neither religion nor politics, but solely by a matter of time. When in power they had had scruples of legality which had not troubled them while scaling the ladder; idols of Paris, they had flattered her in the belief that they could always hold her in restraint: when Paris passed out of their control by her excesses, they sought support in the departments; leaders of a faction, never

of a nation, they brought down with them in their fall both the republic and the liberal *bourgeoisie* which they represented.

Danton.—The first Committee of Public Safety had also been wounded to death by the events of June 2. Its chief, Danton, who was neither a theorist nor a cabinet minister, possessed the vision of a statesman without having a following sufficient to translate his ideas into action. He failed to drive the enemy across the frontiers, or to sow dissension among them by his secret negotiations with Prussia and Sardinia. His temporizing policy towards the federal insurrections and the failure of his operations against La Vendée still further aggravated the discontent aroused by financial problems and the high cost of living. Isolated and suspected Danton fell on July 10, 1793, and his power passed to the Robespierre faction. This was supported by all the forces of democracy for whom there was no alternative but to conquer or die.

Composed of twelve members elected each month and eligible for re-election, dominated by the triumvirate of Robespierre, St. Just and Couthon, the second Committee of Public Safety (July 1793–July, 1794) gradually established a government of iron that crushed all liberty—the most autocratic government which had ever been seen at work. Declared permanent, the committee swept away the Convention and became the real central power. Moreover it realized the need of strengthening itself by co-opting specialists like Carnot, Lindet, Jeanbon Saint-André, the two Prieurs and Cambon.

Robespierre.—The leader of this government was Robespierre. Without special knowledge, or exceptional talents, devoured by jealous ambition and gifted with cold, grave eloquence, he enjoyed a great moral ascendancy due to his incorruptible purity of life, which Mirabeau lacked, and a persevering will that was wanting in Danton. When he entered the committee on July 27, 1793, the situation of the republic seemed desperate. On the northeastern frontiers the armies were in flight; Mayence fell on July 28, and Valenciennes on the 30th; the Alps were threatened in spite of Kellermann; the Spanish were advancing through the Pyrenees; Angers was being threatened from La Vendée; disguised Royalists were arousing the whole valley of the Rhône from Lyons to Marseilles and calling in the Sardinians to their assistance; and Toulon was delivered to the English, whilst Paoli admitted them to Corsica. Henceforth, Robespierre's plan of campaign was—no more temporizing with federalists or with generals afraid to conquer; war to the death in order to enrich the bankrupt republic; and fear as a means of government. The specialists answered foreign foes by their organization of victory; as for foes at home, the triumvirate crushed them beneath the Terror. This government of despair saved France because it was a national government, and was supported by the outburst of patriotism that sent 750,000 soldiers to the armies through the general levy of Aug. 16, 1793; it was aided, moreover, by the mistakes of its enemies. Instead of profiting by Dumouriez's treachery and the successes in La Vendée the coalition, divided over the Polish question, wasted their time on the frontiers of this new Poland. A situation that seemed hopeless in July 1793 had been completely altered by October through the victories at Hondschoote and Wattignies, by which the enemy were repulsed from the northern frontier. The army of La Vendée was crushed by Hoche at Le Mans and Savany; royalist sedition was bloodily suppressed at Lyons, Bordeaux, Marseilles and Toulon; the federalists were disarmed and the *émigrés* dispersed, forsaken by all Europe.

The Hébertists.—The Committee, however, had only overthrown the moderates with the support of the extreme revolutionary factions: it was to be faced with the problem of restraining these. From the very first it was excelled in violence by the Hébertists who were advocates of war to the death, and of the permanency of the Terror; it was they who compelled the Committee of Public Safety, which was too timid for their taste, to adopt the law of the suspects, to lay down a maximum price for foodstuffs and to use the revolutionary army to seize foodstuffs which were being held up by the cultivators. This was the dictatorship of the consumers, workers, and the poor. Despite the eloquence of Robespierre the Committee would not have been able to maintain itself against the attacks of the extremists of the Left and of the

CITIES AND TOWNS OF FRANCE

1. Le Crotoy, an ancient fortified city and port situated on the estuary of the Somme near the point where it joins the English channel. It is frequented as a summer resort. 2. The Promenade des Anglais, on the seafront at Nice, the chief city of the French Riviera. 3. Aerial view of Strasbourg, showing the high gabled roofs with rows of dormer windows, which are characteristic of the town. Strasbourg, the old capital of Alsace, is now the chief town of the French department of the Bas Rhin. 4. Lyons, the third largest city of France, famous for the manufacture of

silk; view from the hill of the Fourvière, looking east across the Saône and the Rhône rivers. In the foreground is the 13th century cathedral of St. Jean. 5. Road near Saumur, the Loire section, northwestern France. 6. Les Andelys, Normandy, adjacent villages on the Seine near Rouen. View of le Petit Andely from the Château Gaillard, a castle built by Richard Cœur-de-Lion. 7. Strasbourg, from the river Ill, which, together with the canal des Faux Remparts, encircles the city, making it an island. The spire of the cathedral is seen in the distance

defeatists of the Right, supported by all the threatened vested interests, but for the timely victories due to the reorganization of the republican army by Carnot. Soon the Hébertists, under the influence of foreign adventurers like Paoli and Anacharsis Cloetz, further complicated these extreme and impolitic measures by an anti-religious policy, as exhibited in the republican calendar and the secular feasts of Reason, which was not less dangerous because it could only profit the coalition. Beneath the double mask of anarchism and atheism, the Hébertists concealed their plan of becoming masters in their turn. Robespierre determined to act boldly, and arrested and executed the leaders of the extremists on March 24, 1794. But the committee feared a reaction in favour of the moderates of the Right, who, with Danton and Camille Desmoulins, sought to put a stop to the Terror and to make peace. On April 5 these enemies were removed by a parody of justice in which, to discredit them, the moderates were tried along with common criminals.

Robespierre now stood alone and omnipotent. As long as his enemies had had control of affairs, he had strained the principles of liberty to the point at which he rendered all government impossible. After his victory, his language suddenly changed and became that of a man labouring under an hallucination. For five months, while affecting to be the representative of "the reign of justice and of virtue," he worked to strengthen with fresh powers his already formidable politico-religious dictatorship. "The incorruptible sought to become the invulnerable"; to accomplish a moral reform the guillotine was crowded. To restore religious beliefs he founded a theocratic government with the police as an Inquisition. The festival of the Supreme Being, the crown of the work of moral reform which turned the head of the new pontiff (June 8), the *loi de Prairial*, or "code of legal murder" (June 10), which gave the deputies into his hand, and the multiplication of executions at a time when the victory of Fleurus (June 25) revealed the uselessness of this aggravation of the Terror, provoked against him the victorious coalition of revenge, lassitude and fear. Vanquished and imprisoned, he refused to participate in the illegal action proposed by the commune against the Convention. Robespierre was no man of action. On the 9th Thermidor (July 27, 1794), the guillotine made an end both of the democratic republic and of Robespierre and his party, thus paving the way for the 18th Brumaire. This was a palliative rather than a solution. From the very beginning the Revolution had unsuccessfully sought a government: between the 9th Thermidor and the 18th Brumaire it renewed its endeavours without any better success. On their return to the Convention on Dec. 18, the Girondins and the Dantonists were confronted with the same financial, social and military problems as their predecessors, but with them returned also many Frenchmen sick of anarchy and misery, whose only conception of order was a restoration of the monarchy. On the other hand, there were many others—regicides, holders of national property and soldiers—who were too deeply compromised in the revolution and who had too great interest in it not to take alarm at a reaction of monarchist tendencies. So much so that the moderates in the Convention, preoccupied with holding off both royalism and terrorism, merely kept disorder alive without establishing an effective government. The risings of the 12th Germinal (April 1, 1795) and the 1st Prairial (May 20) were as much economic upheavals as insurrections instigated by the survivors of Robespierre's party. To suppress them the moderates appealed not to the national guard, but to the army, and henceforward control of the army meant control of power.

After these events the Royalists supposed that their hour had come. While in the south the Companions of Jehu started a "white Terror" which had not even the excuse of "*le salut public*" they planned a double rising—in the west with the help of the English, in the east with that of the Austrians, and sought to bribe General Pichegru. But Hoche crushed the Chouans and the Vendéans at Quiberon (July 21, 1795) and Pichegru refused to entangle himself.

Constitution of the Year III.—The Convention then sought by the Constitution of the year III to set up a regular government. It established a Directory of five members, all of whom

were regicides, and a legislative body composed of two assemblies or councils; the Ancients and the Five Hundred, elected on a property suffrage, a third to be re-elected each year. By this means the former Convention was assured of a majority for some time. Against its continuity of policy and *personnel* the Royalists, who were masters of the sections in Paris ever since the suppression of the daily dole of 40 sous, raised the insurrection of the 13th Vendémiaire (Oct. 5, 1795) which was put down by General Bonaparte. The *bourgeois* republic thus gathered in the fruits of the foreign policy of its predecessors. After France had been freed from foreign invasion in Jan. 1794, the impulse had been given for the spirit of conquest which had been the support of Robespierre's dictatorship: by means of the *amalgam* and the restoration of discipline, Belgium and the left bank of the Rhine had been conquered, and Holland occupied simultaneously with Kosciusko's rising in Poland. Prussia's need to keep and extend its Polish acquisition, the death of Robespierre, the French superiority in *moral* and numbers, and the successive victories of Pichegru, Jourdan and Moreau broke up the coalition. The French republic re-entered the Concert of Europe at Basel (April–July, 1795), where she concluded peace with Prussia, Spain, Holland and Tuscany which not only secured her conquests in Belgium on the left bank of the Rhine, and that of St. Domingo, but also prepared the way for fresh ones. The old spirit of domination that animated Austria and the persistent enmity of England finally turned the Revolution into the paths of war.

The Directory (Oct. 27, 1795–Nov. 19, 1799).—On Oct. 26 the Convention held its last sitting, leaving a deeper impress upon the political history and social ideas than upon the institutions of France. After its disappearance the stage seemed empty. For four years the Directory sought to occupy it, but in truth it oscillated from Right to Left and from Left to Right without creating anything. It speedily discredited itself through its own *coups d'état*, its financial incompetence, religious persecution and warlike policy, and by a further contradiction strengthened the armies attached to the Revolution and kept the latter alive while bidding for the support of a *bourgeoisie* glutted with revolutions and war. Although it filled the councils with former members of the Convention the Directory was in a minority throughout France and always on the alert against the two extreme parties—the old Jacobin faction and the new Royalists. The democratic republicans demanded universal suffrage and lent their support to the desires for social reform voiced by a people ruined through the collapse of the *assignats* and the industrial and commercial stagnation, and exasperated by the tactics of financiers and profiteers. In spite of their defeat on the 13th Vendémiaire, the Royalists hoped gradually to regain a place in the councils by means of the new franchise in order to put an end to the war, religious persecution, and revolutionary legislation.

At the outset of its rule the Directory was brought face to face with the democratic republicans grouped in the Society of the Equals, or Club of the Panthéon. This faction had found a leader in Babeuf and a doctrine in his equalitarian communism. The general poverty and the financial situation aided their propaganda; the successive issues of *assignats* and the multiplication of foreign forgeries had so depreciated the paper currency that the Government, forced to accept them at their face value, was no longer able to levy taxes or to pay the *rentes*. The destruction of the plates from which the *assignats* were printed (Feb. 1796), and the liquidation of two-thirds of the debt (1797) was in vain; and the small *mandats territoriaux* with which they replaced this paper money failed to win any greater confidence. At this juncture the Babeuvists attempted to overthrow the government. Babeuf and his followers were arrested after the conspiracy of Grenelle and were guillotined in May 1797.

Foreign Policy of the Directory.—Since all order had disappeared from the finances, the war became more and more the treasury from which the Directory drew its financial support. Thus the path was thrown open for the generals who became the life and pride of the State. There is a significant coincidence between the bankruptcy that was proclaimed on Feb. 18, 1796, and the appointment of Bonaparte four days later to the command of

the army in Italy. No less significant is the famous proclamation of the young general with which he turned his army towards "these rich provinces." The independent commander of an army which he had rendered unconquerable, not through patriotism and honour but through love of glory and desire for booty, Bonaparte forced the Directory, which he kept alive, to accept his indiscipline. By means of a succession of victories—Castiglione, Arcola, Rivoli—he carried out his programme and made himself indispensable. Through the preliminary negotiations of Léoben (April 18, 1797), he won for himself the support of French public opinion, and shared the territory of the Venetian republic with Austria, contrary to French interests, but conformably with his own in Italy.

Despite these victories, the Directory continued to lose ground throughout the country. Since 1795 the constitutional opposition, which was in reality Royalist, had made threatening progress. It had benefited by the conspiracy of Babeuf, whose communistic projects had frightened the propertied classes; the national bankruptcy had aroused the small *rentiers*. Moreover, the elections of the year V. (May 20, 1797) had brought into the two councils a majority of counter-revolutionaries, and replaced the director Letourneur by Barthélemy, a constitutional monarchist, who had negotiated the Treaty of Basel. Under the pressure of the counter-revolutionaries, the councils revoked in August the laws against the refractory priests and the *émigrés*, and attacked the regicides in the already disunited Directory. Carnot and Barthélemy wished to oppose the Royalist peril solely by a legal means and to profit by the defeat of Austria and the negotiations in train at Lille with Pitt, to make peace. But Rewbell, La Révellière and Barras, the most corrupt of all, thinking that peace would bring a reaction against them, appealed from the rebellious councils to the complaisant sword of Augereau.

On the 18th Fructidor (Sept. 4, 1797) Bonaparte's lieutenant quashed the elections in 49 departments. Deportation took the place of the scaffold, the director Barthélemy and a number of priests were sent to Guiana, and Carnot escaped to Switzerland. Each new *coup de force* strengthened the rule of the army—the vanguard of despotism.

The Aggressive Policy of the Directory.—From his consulate in Italy, Bonaparte estimated the strength of the two currents of public opinion. One was carrying a part of the nation towards a stable and pacific government that would afford them protection for their lives and properties; the other sought to safeguard the results of the Revolution of which Bonaparte himself was the most distinguished child. Although hostile towards the first current before Fructidor, because he feared to compromise the fruit of his victories, he allied himself with it afterwards; to the rupture of the *pourparlers* at Lille and the orders of the Directory to resume hostilities he replied with the signature of the peace of Campo-Formio with Austria (Oct. 17, 1797), and the Directory was consoled for the peace thus forced upon them by the acquisition of the left bank of the Rhine and of Belgium. The army, however, continued to make itself feared. In order to avoid a disbandment of troops which, as on the morrow of the peace of Basel, might add new recruits to the counter-revolution, the Directory nominated Bonaparte to the command of the Army of England, declared military service to be a part of the permanent duty of a citizen, and conceived the immense plan of fortifying the republic by the existence of vassal and tributary republics, such as the Batavian, Ligurian and Cisalpine. But Bonaparte had no intention of lending himself to the projects of an invasion of England upon which Hoche had in vain set his heart. He determined to exchange his temporary proconsulship in Italy for the leadership of a glorious and fruitful expedition to Egypt, which was to destroy the British Empire in India. He forced this expedition upon the Directory which had just, by the *coup d'état* of the 22nd Floréal (May 11, 1798), made an "inverted Fructidor" against the Mountain, greatly strengthened after the elections in May 1798.

Though Bonaparte succeeded by extraordinary good luck in disembarking his army and conquering Egypt, Nelson's destruction of the French fleet in Aboukir bay cut off his retreat (Aug. 1, 1798). At once there arose, on the initiative of England, a second

coalition which was strengthened by the alliance of Russia. Austria broke off the negotiations which had been proceeding at Rastadt and even instigated the murder of the French plenipotentiaries. All the republics that had been called into existence attempted to secure their independence and took up arms. The French army no longer possessed the monopoly of success, nor the spirit for a war of conquest as for a war of national defence; nor had it the numbers, seeing how deeply the country had been bled. Defeats were inevitable. Insurrection raised its head in Italy; as though shattered by the far echo of the cannon of the Trebbia where Suvarov defeated Macdonald, the unstable Directory collapsed on June 18, 1799. Nominated Director in May, Sieyès sacrificed his colleagues Treillard, Merlin de Douai, and La Révellière-Lépaux to the fury of the councils. A few more military reverses like that of Novi, a few more royalist insurrections in the south and La Vendée, a few Orleanist intrigues—and the end came. The reappearance of terrorist measures, as in all the tragic hours of the Revolution, such as the forced levy and the law of hostages, were not enough to put down revolt and protect the frontiers. Sieyès realized that to achieve the indispensable revision of the constitution "a head and a sword" were necessary. In default of Moreau, Joubert was to be the sword of Sieyès; the bullet that killed him at Novi gave the sword of the Revolution to Bonaparte.

The 18th Brumaire.—It was in vain that Brune in Holland and Masséna at Zürich checked the enemy who lingered on the frontiers, as after Valmy. The fortunes of the Directory were doomed. Bonaparte, who had been checked in Syria, disembarked as by a miracle at Fréjus on Oct. 8, 1799. After scheming between the parties, he achieved a military and parliamentary *coup d'état* that was organized within the Government itself. Thus he realized the universal desires of the rich *bourgeoisie*, who were sick of warfare; of the wretched populace; of the new landowners who were alarmed at the prospects of a return of the *ancien régime*; of the royalists by whom he was hailed as a future Monk; of the priests who anticipated an indulgent policy towards Catholicism, and, finally, of the vast majority of the French nation who liked to be ruled and for a long time had not known a government. During the night of the 19th Brumaire, a remnant of the Assembly replaced the Directory by a commission of three consuls: Sieyès, Roger Ducos and Bonaparte. For 15 years, the history of France and a great part of that of Europe was to be summed up in the person of a single man (see NAPOLEON).

The Constitution of the Year VIII.—At first the 18th Brumaire seemed to be the victory of Sieyès even more than of Bonaparte. Bonaparte's cleverness was in opposing Daunou's scheme for a new constitution to that of Sieyès, and in retaining from both only so much as would serve his ambition. Parliamentary institutions annulled by the complications of three assemblies—the *conseil d'état* which drafted bills; the *tribunat*, which discussed them without voting them; and the *corps législatif* which voted them without discussing them: popular suffrage, rendered valueless by the lists of notables from which the members of the assemblies were to be chosen by the conservative senate; and the triple executive authority of the consuls elected for ten years: all these semblances of constitutional authority were accepted by Bonaparte. But he abolished the post of Grand Elector, reserved by Sieyès for himself, thus reinforcing his own authority as First Consul, while he left the other two consuls, Cambacérès and Lebrun, and the assemblies equally weak.

Thus the aristocratic constitution of Sieyès was transferred into an unavowed dictatorship, a public ratification of which the First Consul obtained by a third *coup d'état* from the three millions of reassured electors. They were reassured by his offers of peace to the victorious coalition, which repulsed them, by the rapid disarmament of the Vendéans, and by the proclamations in which he filled the ears of the wearied people with the new diction of stability of government, order, justice and moderation. He gave everyone the feeling that France was once more governed by a statesman, that a pilot was at the helm.

Bonaparte had now to free himself from Sieyès and the republicans collectively who were unwilling to hand over to a single

man the Republic which they wished to exploit and, on the other hand, from his military rivals, Moreau and Masséna. The victory of Marengo (June 14, 1800) opened a new path to his jealous ambition by still further increasing his popularity. The royalist attempt to assassinate him in the rue Saint-Nicaise (Dec. 24, 1800), gave him the chance of ridding himself of the democratic republicans, who were deported to Guiana in spite of their innocence, and of suppressing the assemblies that were a mere show, while he made the senate supreme in constitutional matters. But it was not enough to restore order to France; he must give her the peace which she had so ardently desired for eight years. The Treaty of Lunéville, signed in Feb. 1801, with an Austria disarmed by Moreau's victory at Hohenlinden, restored peace to Europe, gave almost the whole of Italy to France, recognized all the revolutionary conquests and, at the same time, enabled Bonaparte to eliminate from the Assemblies all the opposition leaders in the debate on the Civil Code.

The Concordat (July 1801) was concluded by Bonaparte in the interests, not of the Church, but of his own policy. It enabled him to satisfy the desire of the French for a constitutional and democratic Church, to rally round him the peasants, and, above all, to deprive the royalists of the finest weapon in their armoury. The *Articles Organiques* of the Concordat masked from his generals and councillors the true nature of the change which, in fact if not in theory, reduced to the level of a State religion a Church which had been subjected and deprived of her revenues. Finally, the peace of Amiens (March 1802) with an England disquieted by growing unemployment, a peace made at the expense of France's allies, Spain and Holland, enabled the peacemaker to endow himself, as a recompense from the nation, with a consulate, not for ten years, but for life, with the right to nominate his successor. On that day the Rubicon was crossed, and Bonaparte's march to empire began with the constitution of the Year X. (Aug. 1802).

The Consulate.—The work of reconstruction remained to be done. The touch of the master was at once revealed to all the foreigners who rushed to gaze at a man about whom, after so many strange adventures and catastrophes, Paris, *la ville lumière*, and all Europe were talking. First of all Louis XV.'s system of roads was improved and Louis XVI.'s canals developed; then industry put its shoulder to the wheel; order and discipline were established everywhere, from the frontiers to the capital, and brigandage suppressed; and finally there was Paris, the City of Cities! Everything was in process of transformation; a second Rome was arising with its forum, arches of triumph and parades. In this new Rome of a new Caesar, the luxury and gallantry of the *salons*, the brilliance of the *savants* and artists, the masterpieces rifled from the Netherlands, Italy and Egypt, illustrated the consular peace. To round off his governmental system the First Consul, by the Civil Code, maintained the social order and system of ownership that had sprung from the Revolution; but he cast them in the authoritarian forms of the *ancien régime*. Above all, the system of election introduced by the Revolution completely disappeared. He borrowed from the *ancien régime* its *intendants* or omnipotent prefects, its magistrates nominated by the government, the *vingtièmes* or direct taxes, the *aides*, or indirect taxes—appointing as director for these Gaudin, an ex-official of the monarchy—he borrowed also the administrative centralization and the tradition of conscientious and ordered labour. In this society, now as avid of authority as for ten years past it had seemed enamoured of liberty, peace and order at length assured prosperity; provisions became cheap and abundant in this very Paris that had so often known famine riots; trade prospered and wages were high.

A shadow, however, hovered over this wealth and magnificence: the power of the First Consul lacked a solid foundation. In the *tribunat*, among the republicans, and especially among the soldiers, a very strong opposition had already displayed itself against all the projects most dear to Bonaparte: the Concordat, the order of the Legion of Honour, and the financial system that marked the overthrow of the Revolution. But the expulsion of Madame de Staël and Benjamin Constant, and the purging of the *tribunat* sufficed to put down this Fronde of the *salons*. The San Domingo

expedition drained republican blood from the armies, the war gradually broke the leaders who were jealous of "Comrade" Bonaparte, and, cleverly compromised in a royalist conspiracy, Moreau disappeared into exile. The great mass of the people looked upon the First Consul as indispensable and every attempt upon his life resulted in strengthening his popularity. The conspiracy of Cadoudal and Pichegru, on Bonaparte's refusal to give place to Louis XVIII., and the political assassination of the duke d'Anguien, produced a wave of adulation by which Bonaparte was not slow to profit. The *Senatus Consultum* of May 18, 1804, which gave him the title of emperor, was the natural result of the fear which these attempts had aroused. By his coronation in Notre Dame on Dec. 2, 1804, Pius VII. made this soldier of the Revolution the chosen of God.

THE FIRST EMPIRE

In his foreign policy Napoleon was the slave of history—of the Carolingian legend as of the Capetian tradition, of the aggressive idealism of the Convention equally with the republican propaganda of the Directory. He inherited the natural frontiers of France and the mandate to preserve them, but the most precious conquest was the annexation of Belgium, which England had invariably opposed since the Hundred Years' War. Although he lacked a navy Napoleon hoped to make England consent to this point by his military victories. The old monarchy had exhausted itself in this struggle: Napoleon was to overturn the whole of Europe without better success. France shared the First Consul's illusion that the Peace of Amiens was a final one.

The Third Coalition.—The First Consul hoped to establish his power by peace. He had himself proclaimed president of the Cisalpine republic, and annexed Piedmont; and when he suppressed, in Germany, the ecclesiastical states and free cities under the treaty of Lunéville, the German princes, instead of protesting, gave a cynical assent; he compelled Spain to cede Louisiana, began the conquest of San Domingo, and sent an expedition to annex southern and western Australia. At the same time a French report was published pointing out the simplicity of a recovery of Egypt for France. Alarmed by all these considerations, and excusing herself in particular because of the French seizure of Piedmont, England refused to evacuate Malta, in spite of her pledge to do so. This precipitated war. Napoleon immediately occupied Hanover and established a camp at Boulogne. He sought to strike at England because he knew she was forming a coalition against him. Napoleon had no fleet, Pitt had no army. The disaster of Trafalgar (Oct. 20, 1805) revealed to Napoleon the impossibility of improvising a navy. The third Anglo-Austro-Russian coalition—which, nominally directed against a new Charlemagne was, in fact, aimed at a new France extending to the Rhine and Antwerp—provided Pitt with the army he required. Napoleon broke the coalition by his victories at Ulm and Austerlitz (Oct. 20 and Dec. 2, 1805). After this military triumph, he had two alternatives—to follow the policy of Louis XIV., Choiseul and Vergennes, and reconcile himself with Austria (who would henceforward be driven eastwards and opposed to Russia), or to regard his victories as valueless as long as England remained undefeated and to force her to capitulate by action in the east.

The treaty of Pressburg revealed Napoleon's determination to adopt the latter course. It marked a considerable extension of the Napoleonic empire towards the east. Napoleon had already been crowned in Milan with the iron crown of the Lombard kings. In place of the Bourbons, who were allies of England, he installed his brother Joseph at Naples. He took Venice from Austria, and all her old Adriatic possessions as far as Albania, and expelled her from Germany. He achieved the destruction of the old Holy Roman Empire: and of its fragments he built up in southern Germany vassal kingdoms such as Bavaria, Baden, Wurtemberg and Hesse-Darmstadt, which he attached to France under the title of the Confederation of the Rhine. He carved out other kingdoms for the numerous members of his family. He made his brother Louis king of Holland, and he promised Hanover to the king of Prussia. So powerful did he seem in the early days of 1806 that Alexander of Russia and Pitt made a show of negotiating.

The Fourth Coalition.—At this juncture a new adversary came on the scene in the person of Prussia. Ever since the days of Frederick the Great, France had obstinately considered Prussia as a faithful ally. Napoleon's reply to her challenge was the crushing victory of Jena (Oct. 1806), which destroyed the army and the kingdom of Frederick William III. On the refusal of the latter to concur in his policy, Napoleon made of Prussia what he had already made of the Confederation of the Rhine—a dependency of his empire, and he closed her ports to British ships. At Berlin on Nov. 21 he proclaimed that Continental blockade by which he intended to destroy his great rival.

But it was in fact a vicious circle. Ulm led to Austerlitz, and Austerlitz to Jena. Next he must seek the Russians still farther to the east. The slaughter at Eylau (Feb. 8, 1807) did not bring peace. The victory of Friedland (June 14) compelled the tsar at Tilsit to desert Prussia and to shake off the maritime tyranny of England in return for the partition of Turkey. This treaty closed the entire Mediterranean to England and threatened her communications with India. Napoleon thought that she would bow the knee (July 1807). But England displayed extraordinary energy. The blockade of the Baltic and the bombardment of Copenhagen shattered the illusions of the Franco-Russian alliance. Moreover, although it had been more stringently enacted at Milan, the Continental blockade, in order to be effective, required to be made complete (*see* CONTINENTAL SYSTEM). When the pope sought to remain neutral General Ridet occupied the Papal States, and when Portugal seemed unwilling to close her ports to British ships, Junot entered Lisbon—a step that involved alliance with the Spanish Bourbons. Why should not Napoleon, who had discovered in Berlin proof of their intrigues, treat them as he had treated the Neapolitan Bourbons by establishing in Madrid a Bonaparte, as Louis XIV. had established the duke of Anjou?

The Peninsular War (1809-1813).—After the ambush at Bayonne, Murat made himself master of Spain, subsequently taking the place of Joseph Bonaparte, who exchanged Naples for the Spanish throne. But Napoleon little knew how fierce a flame he was kindling: he thought that he might cut into the granite of Spain as into Italian mosaic, or "that big cake, Germany"; but he lacked the one essential—the assent of a people with a thousand years of history behind them. Their reply to him was a general insurrection. Spain became the grave of 300,000 of his picked soldiers (whom he had to replace by conscripts called up before their time), and a battle-ground for England. Dupont surrendered at Baylen and Junot at Cintra (1808) and, what was more serious, Europe thrilled at this first defeat of the imperial armies. The example of Spain was copied in Prussia, Tyrol and Dalmatia. Napoleon found himself called upon to reduce Spain and intimidate Austria, which was again arming. Through the treason of Talleyrand he was forced to yield to Alexander at Erfurt and to abandon the east in order to carry out the evacuation of the Grand Army from Prussia and concentrate all his strength at Madrid (*see* PENINSULAR WAR).

The Fifth Coalition.—Supported by generous subsidies from England and encouraged by the reserved attitude of the tsar and by Napoleon's difficulties in Spain, Austria sought to take him by surprise as in 1805, and nearly succeeded. Despite Davout's initial success at Eckmühl, the struggle at Essling was severe, and the victory of Wagram expensive. Nevertheless Austria, at the Peace of Vienna or Schönbrunn (Dec. 14, 1809), lost her share of Poland (which was annexed to the Grand Duchy of Warsaw), Trieste and her Adriatic provinces. This peace marks the zenith of Napoleon's power; for two years he was undisputed lord of an empire that stretched from Paris to Rome and Hamburg, and comprised 130 departments. The empire never appeared so great, nor its future so brilliant, as in 1810 when Napoleon divorced Josephine because she had no child, and married an Austrian Archduchess; a year later Marie Louise bore him a son, the king of Rome: the hereditary empire possessed an heir.

The Beginning of the End.—Nevertheless the Tarpeian Rock never stood nearer to the Capitol. Already weaknesses inherent in his work, presaging his downfall, could be seen. The

emperor's chief enemy, England, still survived to stir up and finance the rebellion of governors and governed, and he felt his impotence in face of the national rising in Spain. Men such as Stein, Hardenberg and Scharnhorst made ready in secret for Prussia's revenge. The material omnipotence of Napoleon was defeated by the moral resistance of the pope, his prisoner at Fontainebleau. The Russian alliance was gravely shaken by the threat of a restoration of Poland and by Napoleon's refusal to permit a Russian occupation of Constantinople. Even the men whom he had raised to power sought to oppose his plan. With the sole exception of Murat, all the Corsican dynasties betrayed him; Caroline at Naples intrigued against her brother and her husband; Louis, now Dutch in his sympathies, refused to maintain the blockade and to defend the Scheldt; debauched by his harem at Cassel, Jerome was removed from the surveillance of the coasts of the North sea; and Joseph, who was attempting a moral conquest of Spain, was continually insulted in Madrid. Treason among his officials was added to the intrigues of his own family and the national risings against Napoleon; he was compelled to dismiss Talleyrand, who at Erfurt had revealed his plans to Metternich, and Fouché, who carried on a secret correspondence with Austria and negotiated with Louis and with England. All who had profited by his power dreamed in their turn of becoming sovereigns. Bernadotte played fast and loose with him in order to place on his own head the crown of Sweden, while Soult, like Murat, coveted the crown of Spain after that of Portugal. Many hoped for an "accident" that would bring about a tragic end resembling that of Alexander the Great or of Caesar; moreover France, weary of sacrifice, though vain of her conquests, had had enough. "The cry of the mothers rose threateningly" against "the Ogre" and demanded peace. Finally, amidst the profound silence of the press and the assemblies, a protest was raised against the imperial despot by the literary world, against the excommunicated monarch by Catholicism, and against the instigator of the Continental blockade, by the commercial class ruined in the crisis of 1811. Napoleon himself was no longer the General Bonaparte of his Italian campaign; physical decline had begun, and a falling off in his intellectual capacity showed itself in an unwonted irresolution. The army—that marvellous instrument of his will—gradually lost its technique and *moral*, and all this at the precise moment when, behind the armies and the governments of the *ancien régime*, the spirit of nationality was rising. After two years and three campaigns, the end came.

The Sixth Coalition.—The tsar gave the signal. His versatile character, his Polish and Eastern ambitions, and the dislike of the Russians to cease trading with England, induced him to take up arms. To become sole master of the Mediterranean and the East and at length compel England to capitulate, Napoleon risked his whole fortune on a desperate throw. But Russia was as unconquerable as Spain (June, 1812); neither the victories of the grand armies at Smolensk and the Moskwa (Borodino), nor the capture of Moscow itself, cowed the Russians or induced them to ask for peace. The disastrous retreat from Moscow followed at the moment when the seventh coalition was being formed.

The Seventh Coalition.—Napoleon was forced back from bastion to bastion. After the action on the Beresina, he had to retreat to the frontiers of 1809; then, despite the victories at Lützen and Bautzen, over the Russo-Prussian armies—when he rejected at Prague the treacherous peace which Austria, not yet ready to fight, proffered him—it meant falling back on the lines of 1805. Those of 1800 followed his defeat at Leipzig, where Bernadotte fired upon him, Moreau assisted the allies and the Bavarians and Saxons deserted. The retreat from Moscow had involved the evacuation of Germany; Napoleon had to fall back still further, to the frontiers of 1795, after Wellington's conquest of Spain, the rebellion of Holland and the manifesto of Frankfurt, by which the allies repeated the ruse of Prague and made promises without any intention of keeping them; and further yet, within the frontiers of 1792—despite the brilliant campaign of 1814 across an invaded France in which the Bonaparte of 1796

came to life again and nearly wrung favour from adverse fortune. As England well knew, in a France that had been victorious for 18 years, no one was prepared for invasion. On March 30, 1814, Paris capitulated: the "delenda Carthago" he had pronounced against England had returned upon Napoleon's own head. The great empire of east and west fell to pieces with the emperor's abdication at Fontainebleau (April 6, 1814), and on May 5 Louis XVIII. entered Paris as Napoleon disembarked at Elba.

THE RESTORATION

Who was to govern France? Republican or imperial, the regime which owed its origin to the Revolution was condemned in the war. France could do no more and the eagerness with which Napoleon's marshals ranged themselves on the side of Louis XVIII. showed that they, too, had had enough: the only possible solution lay in a restoration of the Bourbons, as recommended by Talleyrand and England. Without the Bourbons France was doomed to slavery or partition. The allies ended by accepting the dynasty.

The First Peace of Paris.—For the moment Louis' restoration seemed thoroughly popular as a guarantee of peace and liberty. Louis XVIII., who possessed experience, cleverness and dignity, preserved the civil work of the Revolution, despite the opposition of the *émigrés*, in the charter of June 4, by adopting a constitution on the English model, achieving the transition from absolute to constitutional monarchy, and thus reconciling the past with the present.

The first task of the allies was to make peace. This was by no means easy, and the hard conditions laid down showed that they had fought not against the Revolution, nor Napoleon, but against France. After having broken their promises made to the comte d'Artois at the armistice of April 23 to evacuate French territory and to restore the frontiers of 1792 the allies, in the first Treaty of Paris of May 30, 1814, reduced France, except for some slight modifications, to the frontiers she possessed before the Revolution. England, who had waged war for so long to prevent the French domination of Belgium, insisted, as in 1713, on a "barrier" between the Scheldt and the north-western frontier of France, and stretched an eager hand over all the colonies and naval bases by whose possession she would be able to achieve her 18th century plan of naval supremacy.

Louis XVIII., with the brilliant assistance of Talleyrand, profited in the congress of Vienna by the rivalries of Prussia and Russia with Austria and England. In the name of the principle of legitimacy, which had caused him to concede the Charter ("concedée et octroyée") instead of accepting it, and in the name also of the disinterestedness of France, he was successful in protecting Germany from Prussia, Italy from Austria and Turkey from Russia. Scarcely a year after the entry of the allies into Paris France had recovered her place in Europe to an extent beyond all expectations.

The Hundred Days.—It was only necessary, however, for Napoleon to escape from Elba, with an audacity which recalled his return from Egypt, for nearly the whole of France to go over to him. What the natural friction between the returned *émigrés* and the society which had grown up in their absence, and the discontent of half-pay officers, was unable to accomplish, the personal magnetism of Napoleon achieved. Disembarking on March 1, 1815, near Cannes he returned to the Tuileries in triumph on the 20th, while Louis XVIII. fled to Ghent. But it was in vain that Napoleon sought, by the *acte additionnel* of April 22, to win over the remnants of the Jacobins and the liberal opposition by proclaiming his intention of founding a new empire that should be at once democratic and pacific; he merely succeeded in endowing French politics with yet another illusion, one which Napoleon III. was to exploit with such disastrous success. The cannon of Waterloo (June 18, 1815) put an end to an adventure of which the last act was played out at St. Helena.

Louis XVIII. (1814-24).—The results of the Hundred Days were very serious for France. They brought her into conflict with Europe and threatened her with the loss of what Talleyrand had obtained with such effort in 1814. The allies increased their de-

mands in the second Treaty of Paris. Subjected to military occupation and bled white financially, France was reduced to less than she had been before the Revolution and was confronted by the Holy Alliance. Reconciliation at home was a matter of still greater difficulty; for France was henceforth divided into parties—both equally intransigent; the one ultra-royalist, anxious for reprisals and scornful of the Charter; the other composed of Bonapartists and Republicans united by the speedily concocted legend of a liberal Empire, chafing under their defeat and irreconcilable. Once again the France of the *ancien régime* and the France of the Revolution came into conflict, and the whole 19th century is filled with the bitterness of their strife.

Louis XVIII. was very quickly led away by the White Jacobins. The legal reprisals against Marshal Ney and Labédoyère, who were held responsible for the further disasters of France, were followed, above all in the south, by scenes of popular violence which recalled the horrors of St. Bartholomew and the September massacres. The elections of Aug. 14, 1815, held in a turmoil of Royalist and Catholic passions, sent to Paris the *chambre introuvable*, a revival of the *ancien régime*. The chamber certainly showed no sign of docility to the Government. Neither the substitution of the ministry of the Duc de Richelieu for that of Talleyrand and Fouché, nor the enactment of a whole series of repressive laws that violated the Charter, succeeded in satisfying its tyrannical sense of loyalty, and Louis XVIII. was driven almost to a *coup d'état* in order to get rid of the "Ultras" in Sept. 1816. Until 1820 the king and Decazes, with the support of the Constitutionalists and the Liberals, succeeded reasonably well in getting the Constitution to work almost on the English lines of alternation in power of two great disciplined parties—the left centre and the right centre. Baron Louis, the Restoration minister of finance, brought order into the treasury, a necessary preliminary condition for the termination, before the specified date, of the foreign military occupation; the electoral law of 1817, by its institution of direct elections and a high property qualification, assured the predominance of the middle classes; Gouvion Saint-Cyr's measure, passed in 1818 and in force until 1868, based the recruitment of the army on conscription; and the Liberal press law of 1819 enacted that press offences were to be tried by jury. But the rapid progress of the Liberal movement which in the course of elections had, in three years, increased the number of Liberal deputies from 25 to 90, among them the constitutional Bishop Grégoire, followed by the assassination of the heir to the throne, the Duc de Berri, on Feb. 13, 1820, caused the downfall of Decazes and induced the government to reconcile itself with the Right (Feb. 1820).

Until the end of 1824, Decazes's successors devoted themselves to destroying his liberalizing work, especially that of the electoral and press laws. This was the period of great activity on the part of a secret society for clerical propaganda known as the Congregation. In order to keep himself in power, Villèle, a clever man of business, but bound by his party ties, was forced to submit to the impatience of the Comte d'Artois and the majority; the suspension of individual liberty, the re-establishment of the censorship, the electoral law of the "double vote" which favoured the more heavily taxed electors, and the surrender of the control of education to the clergy, marked the commencement of a counter-revolution. The Spanish expedition advocated by Chateaubriand to restore Ferdinand VII. to his throne, was the work of the Congregation and the Holy Alliance. The Liberals replied with a new form of opposition in the secret Carbonari societies (as in Naples), and in Spain these societies plotted military risings which were ruthlessly suppressed. But despite all this, on the death of Louis XVIII. in 1824, the dynasty appeared to be firmly established. The success of the Spanish expedition had reconciled the army to the White Flag. The growth of public credit and material prosperity satisfied the propertied classes. The opposition was destroyed, and public life was sterilized by the law of septennial elections which was voted by the "Chambre retrouvée" and which suspended for periods of seven years any regular political demonstrations.

Charles X. (1824-30).—It was the monarchy that became

revolutionary on the accession of Charles X. (Sept. 16, 1824) who, although seated on the throne and endowed with greater charm, if less statesmanship, than his brother, was the most fanatical of those *émigrés* who had learnt nothing and forgotten nothing. He grew weary of the Liberals' incessant reproach that the monarchy had come back in the baggage-wagons of the enemy, and he had to deal with a new generation which had never known the Revolution, nor even the Empire—a generation always in a hurry, hot-headed and impatient for the immediate realization of its desires.

Hence the experienced and moderate Villèle, now prime minister, was attacked not only by the Left, but also by the extreme Right. The latter continually threw down challenges to the modern spirit of France. The law against sacrilege, the re-establishment of the right of primogeniture, the indemnity of a thousand millions designed to tranquillize the holders of State property, but which looked like compensation for the *émigrés*, all this aroused public feeling against Villèle—even the conversion of the *rentes* which had reached par. The moderate and statesmanlike policy of Villèle in foreign affairs was no less subject to attack; a stranger to the romanticism both of the Right and of the Left, he declined to embroil Europe for the sake of tearing up the 1815 treaties. The battle of Navarino (1827) in which the Turkish fleet was destroyed, was fought contrary to his instructions. He resigned in Jan. 1828, and the moderate royalist, Martignac, who succeeded him was only a stop-gap whom Charles X. endured without supporting, and with whom the Liberals bargained for the price of their assistance (Aug. 1829). Charles X. took the opportunity to form, with the prince de Polignac, a mystical and ignorant *émigré*, and the comte de Bourmont, the traitor of Waterloo, a fighting ministry which should at one and the same time enforce the royal prerogative and wipe out the treaties of 1815; he thought to find a brilliant success abroad in the capture of Algiers (July 5) which was the prelude to the conquest of Algeria, but the nation was not interested: Algiers was too far from the Rhine.

The Revolution of 1830.—After winning the July elections in 1830, the coalition of Liberal Monarchists and imperialist Republicans first tried lawful resistance and subsequently achieved a popular *coup d'état* against the ordinances of July 1830 which had dissolved the *chambre inamovible*, eliminated license dealers from the electoral list and crippled the press. After a three days' battle against the troops feebly led by the Marmont of 1814, the workers, driven to the barricades by the deliberate closing of the workshops, conquered Europe at least as much as Charles X., who bore the white flag of the Bourbons away with him into perpetual exile (Aug. 14).

The July Monarchy (1830-48).—By summoning to the throne a Bourbon of the younger branch, the liberal *bourgeoisie* thought they had found the ideal solution of the problem. Would not the Duc d'Orléans, who was the son of a regicide, and who had fought at Valmy and at Jemappes, reconcile in his own person the Revolution and the *ancien régime*? In reality the July monarchy was affected with congenital weakness; it sought to model itself on the English monarchy which rested upon a single ancient tradition whereas in France there were two contradictory traditions—the Catholic-legitimist and the Revolutionary—both of which told against Louis Philippe. Under the affable mask of a bourgeois and peace-loving king he hid a determination to recover an authority of which he was very jealous; from the beginning of his reign he fell foul of the legitimists, who looked upon him as the "king of the barricades" and the usurper of his cousin's crown. In the eyes of the Republicans, too, he was a usurper, since he had been chosen by only a part of a chamber in dissolution. The latter had thrown away their victory by installing the Duc d'Orléans in the Palais Bourbon. Thus, when Louis Philippe was endeavouring to reduce the revolution of 1830 to a mere substitution within the reigning family, the republicans considered that the revolutionary tradition had been revived with the tricolour and had restored to France the sympathies of the nations and democratic parties which sought support against Metternich's Holy Alliance. Finally, the Republican party who had withdrawn from

power, if not from all activities, never ceased to remind him of the grave problem arising from the acquisition by the people of political power.

The men who, since 1829, had secretly organized the Orleanist Party and had chosen Louis Philippe, were divided among themselves on the policy to be followed in face of the opposition of the ultra-republican parties. Some thought with Laffitte and La Fayette that the July revolution and the lowering of the suffrage qualification by the revision of the Charter amounted to no more than a prelude, and demanded an extension of the suffrage and a destruction of the treaties of 1815; hence their name, the "Party of Movement," and their frequent alliances with the Republicans. In the opinion of the "Party of Resistance," on the other hand, led by Casimir-Périer, Guizot and Thiers, the July monarchy should follow a conservative and pacific policy. They forgot the tempestuous experience of the electoral chambers of the Restoration, and that Louis Philippe, who had the support neither of legitimacy nor of a plebiscite, had, in refusing universal suffrage, deprived himself of the support of the mass of the populace—at that time chiefly rural and the most conservative and pacific element in the nation. From the start the new monarchy was beset with difficulties. The mob that had created it demanded its reward. Louis Philippe summoned to the ministry first Dupont de l'Eure, then Laffitte, leaders of the Party of Movement, in the hope of using them for his own ends. The ministers soon had to withstand the pressure of the mob, which demanded the death of Charles X.'s ministers, sacked the Church of Saint-Germain l'Auxerrois, where the Legitimists had been guilty of a tactless demonstration, and brought about the terrible strike of the silk-weavers at Lyons. But the greatest danger for Louis Philippe lay in foreign affairs: the Belgians had risen against Holland, and the question arose of the desirability of re-annexing Belgium, which seemed to be not unwilling to accept help, and so settle under the most favourable conditions the perennial problem of Flanders. Despite the insistence of Laffitte, Louis Philippe recognized that England would never tolerate the annexation. He chose to pursue a wiser policy, the fruits of which were not gathered until 1914, and to concur in the creation of Belgium as a neutral state. He refused the crown of the new kingdom for his son (March, 1831).

Eight months after the July Days, Casimir-Périer succeeded Laffitte as prime minister and with him came into power that "Party of Resistance" to advanced ideas which was to rule France for 17 years. Peace having been assured abroad, order had to be established at home. This was not accomplished without violent agitation, both by the Right and the Left, such as the disorder which accompanied the obsequies of General Lamarque, and the attempt of the Duchesse de Berri to raise *la Vendée*. The new electoral law, though lowering the age and the qualifications of the electors, left the control of the elections in the hands of the moneyed classes. The institution of a national guard provided Louis Philippe with an army. After Casimir-Périer's death from cholera in May 1832, the Soult Ministry struggled with the socialist risings in Paris and Lyons fomented by the Society of the Rights of Man, and repressed by the threatened middle-classes with a thoroughness that was the precursor of the June Days and the Commune. The attempted assassination of the king and his family by Fieschi (July 28, 1835), followed by the enactment of the September Laws, was the destruction of the Republicans. Only in Guizot's law for the regulation of primary education was a new influence evident.

Though they were agreed as to the desirability of maintaining the monarchy the victorious middle classes were in disagreement about the powers it should exercise. The conflict of warring ambitions and parties for the control of the ministry loosed a veritable Fronde against the king. The Right Centre, led by Guizot, were prepared to admit the king to an active share in the government: the Left Centre, led by Thiers, believed that he should reign but not govern. Between these two stood the opposition of the nearly republican monarchical Left. Louis Philippe endeavoured to take advantage of these party squabbles to ensure victory for his personal policy. The last experience of a ministry composed by the

parliamentary majority was that of Thiers in 1836; when, however, Thiers showed signs of embroiling himself with Metternich by an intervention on behalf of the Spanish Liberals, Louis Philippe dismissed him and replaced him by a creature of his own, Molé. Then began the period of the king's personal government and of the systematic opposition of the coalition of the two Centre parties and the monarchical Left against the "*homme du château*," Molé; he was defeated in the elections of 1839, as Martignac had been in 1829, and was replaced, after a long ministerial crisis, by Thiers (March 1, 1840).

The Thiers Cabinet.—Like Chateaubriand under Louis XVIII. Thiers sought to make the monarchy rival the Napoleonic glory which he himself resurrected in the pages of his history. Too bellicose to win the confidence of the king, who loved peace and the English alliance, Thiers fell from power over the Egyptian Question. The Treaty of London of July 15, 1840, was signed by the remaining great powers without the knowledge of France, since France had persistently refused her co-operation. As though this revived against her the Pact of Chaumont of 1814, Thiers fortified Paris and made a show of supporting Mohammed Ali by force of arms. The nation, stirred but little by the attempted *coups d'état* (Strasbourg, 1836—Boulogne, 1840), of Louis Napoleon, son of the former king of Holland, was thrilled in 1840 by the return to France of the body of Napoleon I. Its chauvinism revealed to the advocates of peace at any price that military inaction had ended by making peace itself warlike and by demonstrating the advantage of imperialism.

The Guizot Cabinet.—From 1840 to 1848 Louis Philippe's foreign policy became more and more lethargic, and he lent himself more and more to deception abroad and unpopular measures at home. Guizot fell into line and his watchword became "Peace and no reform." Except for the railway law of 1842, no single measure of importance was carried. Corruption was rampant in France; corruption, due to the illegal conduct of the deputies, many of whom were slavish or venal officials; electoral corruption, effected by the purchase of the 200,000 electors constituting the "*pays légal*"; and moral corruption, due to the reign of the bureaucracy and exemplified in a series of outrageous scandals. This state of stagnation pleased the dominant middle class entrenched behind its twin citadels of the property qualification and the national guard. Their rallying cry, borrowed from Guizot, was "get rich quick." This bloated, industrious, well-educated but insolent and hard-hearted *bourgeoisie*, which speculated in railway shares and went in large numbers to church, forgot that wealth alone is not so much a protection for the minority in power as a temptation to the excluded majority. They remained obstinately deaf to the grievances of a growing industrial proletariat.

In face of this tragic contrast Guizot remained unmoved, blinded by the superficial brilliance of apparent success and prosperity. He adorned by flights of eloquence his invariable theme: no new laws, no reforms, no foreign complications—the policy of material interests. He maintained his yielding attitude towards Great Britain in the affair of the right of search (1841), and in the affair of the missionary and consul, Pritchard, at Tahiti (1843–45). And when the marriage of the Duc de Montpensier with a Spanish infanta in 1846 had broken this *entente cordiale* to which he clung, it was only that he might in turn yield to Metternich (who seized Cracow, the last remnant of Poland), or protect the *Sonderbund* in Switzerland, or discourage the Liberal ardour of Pius IX., or hand over the education of France to the Ultramontane clergy. Still further strengthened by the elections of 1846 he refused the demands of the Opposition formed by a coalition of the Left Centre and the Radical party for parliamentary and electoral reform, which would have excluded the officials from the Chambers, reduced the electoral qualification to 100 francs, and added to the number of the electors the *capacitaires* whose competence was guaranteed by their education. For Guizot the whole country was represented by the "*pays légal*," consisting of the king, the ministers, the deputies, and the electors. When the Opposition appealed to the country, he flung down a disdainful challenge to what "les brouillons et les badauds appellent le

people." The challenge was taken up by all the parties of the Opposition in the "campaign of the banquets" got up somewhat artificially in 1847 in favour of the extension of the franchise. The monarchy had arrived at such a state of weakness and corruption that a determined minority was sufficient to overthrow it. The prohibition of a last banquet in Paris precipitated the catastrophe. The monarchy which for nearly 18 years had overcome its adversaries, collapsed on Feb. 24, 1848, to the astonishment of all.

THE SECOND REPUBLIC

On this occasion, and in contrast to the July Days of 1830, the *bourgeoisie* were taken by surprise and, for want of time, failed to outmanoeuvre the revolution. Hence they were compelled to accept a "democratic and social" republic of a distinctly red character. Thus, along with a great enthusiasm, there were signs of a panic inspired by fear of the socialism which, under the July monarchy, had developed with the growth of industry and of the working class population.

Included in the provisional government installed in the Hotel de Ville, and not, as in 1830, in the Palais Bourbon, were moderates like Lamartine, and advanced republicans like Ledru-Rollin, a socialist theorist, Louis Blanc, and a worker named Albert. What was to be their policy? The Socialists, declaring that 60 years of political change had not improved the condition of the people, demanded the reform of society itself and the abolition of the privilege of property, the sole obstacle to equality, and unfurled the red flag. The remaining parties wished to maintain society on its former foundation and rallied around the tricolour. Under the pressure of the Parisian clubs the provisional government was forced to enact universal direct suffrage, to open the national guard, till then reserved to the middle classes, to all, and to guarantee work for all its citizens by creating national workshops (*q.v.*) and by setting up the Luxembourg commission to enquire into social reforms (see BLANC, J. J. LOUIS).

The Constituent Assembly.—The Constituent Assembly was elected on May 4, 1848. By paradox, universal suffrage had resulted in the election of a majority of moderate republicans and these entrusted the Government to an executive commission from which the Socialists were excluded. From this instant, the attraction disappeared from this bloodless revolution which was to abolish poverty by the organization of labour, and which had at once awakened the fraternal solidarity of the people. On May 15 the democrats under the leadership of Raspail, Blanqui and Barbes, attempted to overthrow the Government by an insurrection. This error brought together the Republicans and the Right. The republic became unpopular both with the peasants, who were irritated by the new land tax of 45 centimes, and the middle classes, who were terrorized by the omnipotent clubs and ruined by the general stagnation of trade. Would the republic retain the support of even the workers? Since the decree of Feb. 24 had proclaimed the right of every man to work, the provisional Government had established national workshops; they were organized by Marie to prove the falsity of the theories of labour organization of his colleague, Louis Blanc. Their sudden closure by the Assembly on June 21 caused the insurrection desired by the Legitimists under Falloux, and the Bonapartists led by Louis Napoleon who had just been elected a deputy. For the first time since 1789, the insurrection was confronted with a strong Government ready to defend itself. During June 24–26 the working-class east of Paris, under Pujol, fought with fury against those of the west, under the republican dictatorship of Cavaignac. Defeated, decimated by executions, and later by deportations, the Socialist party was crushed. Fear of the "Reds," of the "*partageux*," opened the way to the Second Empire.

The road was swiftly traversed. In the new constitution of Nov. 4, the legislative power was given to a single assembly chosen by means of the *scrutin de liste* and the executive power to a president chosen by the people for four years and not eligible for re-election. Through inexperience, by omitting to declare the members of former ruling dynasties ineligible, despite the objections of Grévy, the assembly made the presidency an office dependent on popular enthusiasm.

The Presidency of Louis Napoleon.—The plebiscite was held on Dec. 10. A lively electoral battle was fought between Cavaignac, Lamartine, Ledru-Rollin and Prince Bonaparte. The name of Napoleon, with its halo of glory, won the election with more than 5,000,000 votes. Unknown in 1835, forgotten after Strasbourg, laughed at after Boulogne, Louis Napoleon had in eight years profited more by the state of feeling aroused by the July Government, which had stupidly awakened memories of the Empire, than by his own manifestoes that were conservative in spirit, but democratic in style. The monarchists, with Thiers and Montalembert, whose reactionary policy now passed beyond the saving dictatorship of the incorruptible Cavaignac, rallied round Louis Napoleon who had promised them freedom of education. Moreover, the peasants—ever friends of order—and even many of the working men themselves, had voted for the “nephew of the great Emperor.”

The ensuing three years were occupied with an indecisive battle between a legislative assembly that was not homogeneous, though elected on an anti-republican ticket and favouring the party of order, and the prince-president, who was timid and taciturn, but who was awaiting his time. At first he chose his ministers from among the moderate republicans, and to strengthen his own position gave pledges to the reactionary party without allying himself to any of them. He gratified Catholic opinion by an expedition to Rome, designed to re-establish the pope who had been expelled by Garibaldi and Mazzini, and to commence that work of European reconstruction that he was already beginning to consider his mission. When, however, General Oudinot changed the character of the expedition, whose especial purpose was to prevent Austrian intervention, and attacked the Roman republic, the republicans of the Mountain, in answer to the summons of Ledru-Rollin, rose in revolt and were defeated (June 13, 1849).

The disappearance of the republican leaders assisted the Catholic and monarchical majority. It already had “the republic without the republicans.” It only remained for Louis Napoleon to lay his hand upon the system of education—that medium for dissemination of socialist ideas—and then to restore the monarchy. The prince-president pretended to share in the fears aroused in the majority in consequence of the supplemental elections of March and April 1850, which had resulted in an unexpected victory for the advanced republicans.

The Falloux law of March 15, 1850, under guise of establishing liberty of education, in reality handed it over to the Catholics. For half a century the Church was destined to destroy the work of intellectual emancipation achieved by the 18th century and the Revolution. The majority next attacked universal suffrage. The Electoral law of May 31, in requiring of every voter a domiciliary qualification of three years, deprived of its vote the working class population, which was forced by its occupation to be migratory. The Press law of July 16, by re-establishing the “caution money” deposited by editors as a guarantee of good behaviour, aggravated the severity of the press laws.

After the Socialists, it was the turn of the republicans to be crushed. But the President only lent his aid to this campaign in the hope of obtaining the peaceable revision of the constitution. The monarchists, for their part, had only accepted his presidency as a stage in the return to monarchy. A conflict was inevitable. Louis Napoleon cleverly exploited their projects for a restoration which he knew to be unpopular with the country. He travelled through France discreetly posing the question of a revision of the constitution in speeches the tone of which varied according to the district in which he was speaking; he flattered and ingratiated himself with the army, while dismissing Changarnier, the general selected for a monarchical *coup d'état*. Finally he substituted for his Orleanist ministers unknown men who were devoted to him personally: Morny, Persigny, Fleury. It had now come to open warfare. In reply to the defiant motions of the assembly he at once scared the *bourgeoisie* by denouncing the existence of a vast communistic plot, and attacked the electoral law to win over the mass of the people. The assembly retorted by refusing either to abrogate the article of the constitution which forbade the re-election of the president or to restore universal suffrage. All hopes

of a peaceful issue to the quarrel disappeared. The Mountain, fearing a monarchical restoration, refused to the quaestors of the Chamber the right of calling on the troops and thus disarmed the legislative power. Louis Napoleon took advantage of this during the night of Dec. 2, 1851; he dissolved the assembly, re-established universal suffrage, caused the party leaders to be arrested and had his powers prolonged for ten years by another assembly. The army dispersed the republican minority in Paris and the provinces, and the plebiscite of Dec. 20 sanctioned the *coup d'état* by an enormous majority. The Second Empire was established.

THE SECOND EMPIRE (1851-70)

This new 18th Brumaire resulted naturally in a new “constitution of the year VIII.” It restored the consular dictatorship and the same political institutions. The sole innovation was the election of the *corps législatif* by universal suffrage. This new political change had rapidly the same consequences as that of Brumaire. A year later, on Dec. 2, 1852, Louis-Napoleon re-established the hereditary empire and took the title of Napoleon III., acclaimed by an almost unanimous plebiscite.

The Autocratic Empire (1852-60).—Although the Second Empire had a machinery of government similar to that of the First, it differed in principle: though it was the heir to the Napoleonic tradition of order and authority, the emperor had none the less been chosen by popular vote. It was, therefore, incumbent upon him to give to his people the material and moral benefits that, from his prison at Ham, or his exile, he had often reproached the former oligarchical Governments for having neglected. Reaction at home, liberalism abroad—that was his programme. Hence he set himself to paralyze everything that might inculcate in the people a public spirit: universal suffrage, parliament, press, education. The first was mutilated by the system of official candidates, the *corps législatif* silenced, the press muzzled by the *autorization préalable* and by the censorship, education subjected to a severe system of control, and the republican opposition rendered harmless by the law of public safety after Orsini's attempt to murder the emperor, purely Italian in origin though this was. France became a sickroom in which the people spoke in lowered voices. For ten years political life was dead. The Empire lived upon frequent plebiscites. Until 1857 the opposition was non-existent; during 1857-60 it consisted of five members. The monarchists, who were never united, maintained a *Fronde* in the salons.

Internal Policy.—The condition of the existence of the autocratic empire was that liberty should be forgotten in a material prosperity that would make all interests tremble at the idea of a revolution. Hence Napoleon sought and found his support in the clergy, great financiers, industrial magnates and great landed proprietors. He revived for himself the slogan of 1840: “Get rich quick.” Under the influence of the Saint-Simonians, great credit institutions and public works were launched—the *Crédit Foncier*, the *Crédit Mobilier*, and the amalgamation of the railways. The fever for speculation was heightened by the influx of Californian and Australian gold, and the consumer benefited by lower prices and the removal of customs restrictions. The Universal Exhibition of 1855 was the apotheosis of French activity. The court fêtes at Compiègne, after Napoleon's marriage with Eugénie de Montijo, set the fashion for the admiring *bourgeoisie* who were satisfied with this strong Government which kept such good guard over their bank balances. But though the empire was strong, the emperor was weak. At once headstrong and a dreamer, he was full of rash plans, but too irresolute in action; he remained what his life had made him, a conspirator and a revolutionary by reason of his demagogic imperialism, and his democratic chauvinism. Moreover his foreign policy was as full of contradictions as his home government. “*L'Empire, c'est la paix*,” he declared at Bordeaux. Yet he made war.

Foreign Policy.—While his power lacked a firm basis, Napoleon III. was compelled above all else to reassure opinion in Europe, uneasy as a result of his earlier protests against the treaties of 1815. The leader of a hostile coalition could only be England, and with her he felt impelled to maintain an *entente*

cordiale. So he allied himself with her against Russia in defence of the integrity of the Ottoman empire, and at the same time rallied round him the Catholics who were preoccupied with the question of the Holy Places and the Liberals hostile to the autocratic tsardom.

The Crimean War (*q.v.*) was the prototype of his other wars. Begun without any definite military objective, it was waged with irresolution. After the long and costly siege of Sevastopol, the war was thrust back far from Constantinople by the terms of peace; and did not forget the injury. Intoxicated by his triumph and assured of a dynasty by the birth of the Prince Imperial (1856) Napoleon thought that he had wiped out the disgrace of 1840. He requested the congress of Paris (1856) to take into consideration the questions in which he was most interested, Poland and the Roman question, but England refused. Sea-law apart, the sole benefit of the congress was to permit Cavour to bring the Italian question to the notice of Europe.

It was not his attempted assassination by Orsini that recalled the question to Napoleon. He had never forgotten the days of his youth. He believed that the hour had come for him to execute his chosen mission. Torn between the empress, a fanatical Catholic who was opposed to everything that might menace the papacy, and the prince Napoleon, who, as brother-in-law of Victor Emmanuel, took the side of Piedmont, he hoped to please both by the creation of an Italian federation presided over by Pius IX. At Plombières Napoleon offered to Cavour the sword of France that had been invoked by Orsini on the steps of the scaffold. By fighting Austria after the war, Napoleon carried out another clause in the Liberal programme. On May 3, 1859, he proclaimed his intention of making Italy "free from the Alps to the Adriatic." As four years earlier, so now he raised limitless hopes without counting the cost; hence, two months after the hardly-won victories of Magenta and Solferino, Napoleon signed with Francis Joseph the patched-up armistice of Villafranca. Austria ceded Lombardy to Napoleon by whom it was handed over to Victor Emmanuel. But Modena and Tuscany were restored to their respective dukes and the Romagna to the Pope, as the president of an Italian federation. The war with Austria had thus miscarried. A yet disunited Italy spoke of French treason, and from that time believed the emperor too highly rewarded by the cession of Nice and Savoy (May 24, 1860). But the war had also raised the Roman question. To refuse Rome to Italy was to violate the principle of nationalities and to arouse the resentment of the French Liberals. To give it to Italy was to alienate the French Catholics who, since the *coup d'état*, had always supported Napoleon. He was only able to reconcile dynastic interests with those of nationality by a provisional solution—which would hold good only so long as he himself remained master of the situation. A powerful Catholic and Protectionist opposition quickly arose. The French clericals were greatly incensed by the Italian revolutionaries, who sought to make an end to the temporal power of the pope. The Syrian expedition of 1860, in aid of the Maronite Catholics persecuted by the Druses, did nothing to disarm this opposition. On the other hand the emperor who, to satisfy England, had already dismissed his minister of foreign affairs, Walewski, signed with that country on Jan. 23, 1860 a commercial treaty by which the duties in England upon French agricultural produce, and in France upon English manufactured goods, were lowered. By this free trade policy French industry, though accustomed to protection, was suddenly exposed to foreign competition. Now indeed the Catholics and the Protectionists perceived dangers in the absolutism that they had admired for just so long as it served their ambitions and their interests. To restore the empire to its balance, Napoleon sought that support from the Left which he was losing on the Right; a general amnesty proclaimed after his return from Italy marked a stage (which lasted for ten years) in the evolution of the autocratic into the liberal and finally the parliamentary empire.

The Liberal Empire (1860–69).—It was the liberals at home who were to be placated by the establishment of the liberal empire. By the reforms of Nov. 24, 1860, Napoleon removed the gag which had kept the country silent, increased the powers of

the *corps législatif*, and proceeded, through the grant of an annual vote on the address and the right of voting the budget by sections, towards a parliamentary government. He promised the conservatives, who disliked his policy of *laissez faire* in Italy, an end to interventions in Europe, together with the maintenance of the temporal power, and peace. But his support of the Italian cause had aroused in other nationalities a spirit of impatient hope. Would he be able to abandon them without arousing the indignation of the Liberals, and without adding further embarrassments to those already occasioned him by his Italian venture? In 1863 in Poland, Schleswig-Holstein, the Danube Principalities, and in Italy, united even though it lacked frontiers and a capital, the new principle of nationality loudly demanded satisfaction. Confronted with the opposition of Europe Napoleon III. was once again forced to curb Italian impatience, to permit Poland to be exterminated, and to hand over the Danes to the Austro-Prussian Coalition (*see SCHLESWIG-HOLSTEIN QUESTION*).

These inconsistencies produced in France, under the name of the *Union libérale*, a coalition of all the discontented elements—the Catholics, the leaders of industry, and the anti-Napoleonic parties of the Monarchists and the Republicans. In the elections of 1863 the opposition won 40 seats and obtained a leader, Thiers, who in its name, instantly demanded "the necessary liberties."

Industrial Policy.—Confronted with the constitutional opposition of Thiers and the irreconcilable opposition of the Republicans, while the *bourgeoisie* grew daily more ambitious, Napoleon strove to reinforce his threatened authority by turning to the working classes from whom he had received it. Nothing seemed more easy of accomplishment than to exploit their old hatred of the capitalist; Chapelier's law (1791) had denied them the right of combination, the limited suffrage had conferred a political monopoly on capital, and the workers remembered how the selfish *bourgeoisie* had called upon them to defend now the Charter, now universal suffrage, and had repaid them only with ingratitude, or with machine-guns. The silencing of public opinion under the Empire and the general prosperity had caused a cleavage between the Labour party and the other political parties. But the despatch of a Labour delegation to the London exhibition in 1862 had enabled them to resume contact. Henceforth the emperor put no obstacle in the way of consumers' co-operative societies, of the right to strike, or of the development of trade unions; he did not even oppose Tolain's plan for the foundation of an international association of workers (*see INTERNATIONAL*), and even gave his patronage to employers' welfare and friendly societies which had for their object the betterment of the working man's lot. Thus secured in his rear, the emperor believed himself able to reject, through Rouher, every fresh demand of the liberals: always seeking for a success abroad that would establish his dynasty, he returned to the policy of seeking "compensation."

European Politics.—By the expedition to Mexico, Napoleon believed that he had diverted the thoughts of the French Catholics from Rome. He even hoped that, in return for the Mexican crown thus conferred on his brother Maximilian, the emperor, Francis Joseph, would peacefully yield Venetia to Italy. At Biarritz, in 1865, in return for vague promises of "compensation," he promised his neutrality to Bismarck, who wished to exclude Austria from Germany. Suddenly there came the news that the Austrian army had been defeated at Sadowa (July 4, 1866). The strength that till then Prussia had prudently concealed was laid bare. An intervention on behalf of Austria would deprive Napoleon of the reward for which he hoped. Moreover he could hardly have intervened, for want of the men and the money thrown away in Mexico. All over France there arose a feeling of surprised irritation against Prussia which, since the days of Frederick the Great, had persistently enjoyed the goodwill of France. By the Treaty of Prague, Prussia eliminated Austria from Germany, united, through the annexation of Schleswig-Holstein and Hanover, the hitherto scattered fragments of the Prussian monarchy, placed herself at the head of a great North German Confederation, and concluded military conventions with the South-German states from which this was only separated by the rubicon of the Main.

All confidence in the superiority of imperialism vanished at

once. In the name of the opposition, Thiers and Faure denounced in the *Corps Législatif* the blunders of 1866. Emile Ollivier broke up the official majority by forming a third party between the anti-dynastic opposition and the extreme Bonapartists, and gave it out that a reconciliation with the empire would be impossible until the emperor granted full political liberty. Undecided by nature, and rendered still more so by disease, the emperor during three years made concessions on the lines laid down by Ollivier, but destroyed their value by permitting Rouher to mutilate them by the way in which he put them into force. Meanwhile in his foreign policy Napoleon met with defeat after defeat.

1867-68.—1867 was a particularly disastrous year. In Mexico the "greatest idea of the reign" ended in a humiliating evacuation in answer to an ultimatum from the United States. Supported by a new ally, Prussia, Italy mobilized the forces of revolution to achieve her unity in Rome. This time the *chassepots* of Mentana checked the onslaught of Garibaldi's Red Shirts. When the emperor tardily recalled the promises made to him at Biarritz and sent Bismarck his "innkeeper's account," in which he first demanded Mainz, then Belgium, and finally said he would be satisfied with Luxembourg (*q.v.*), his ambassador, Benedetti, added to the mistake of asking at the wrong time the humiliation of obtaining nothing. Napoleon dared not resort to force and so laid bare his weakness; and finally courted the mockery of Europe by inviting it to a display of the external magnificence which concealed the decline of France. In the new Paris of Haussmann, the *Exposition Universelle* opened with Berezowski's attack upon Alexander III., and closed amid the echoes of the tragic fate of Emperor Maximilian of Mexico. Well might Thiers exclaim: "There are no blunders left for us to make." Yet the emperor managed to commit still more, entailing irreparable consequences for the dynasty, and for France. Old and ailing, stung by the triumph of the opposition in the elections of 1867, he was faced with the choice between a lasting peace and a decisive war. He allowed himself to drift in the direction of war without making the necessary preparations to wage it. Indifferently supported by the Government, distrusted by an electorate that had allowed commercial or international interests to oust patriotism, and strongly opposed by the Left which feared to strengthen the hands of the emperor, the military reforms of Marshal Niel were defeated. By the laws of May-June, 1868 Napoleon sought in vain to preserve his right of action by granting freedom of speech and assembly. Everything he did redounded to the credit of his enemies. The *Châtiments* of Victor Hugo, the *Lanterne* of Rochefort, and Gambetta's terrible indictment in the law courts proved that the Republicans were irreconcilable. The Ultramontane party grew sulkier and sulkier; the manufacturers grew daily more and more dissatisfied with free trade. Worse still, the working-classes, gradually won over to the theories of Karl Marx and Bakunin, had passed to the enemies' camp, and the strikes that grew daily more frequent became, in effect, a review of the fighting strength of the Revolution.

The Parliamentary Empire (1869-70).—Held amidst this fevered state of public opinion, the elections of 1869 inflicted a resounding moral defeat upon the emperor. He was compelled to come to terms with the victorious Third Party and to entrust to its chief, Ollivier, the Government of the parliamentary empire (Jan. 2, 1870). The plébiscite of May 8 sanctioned this transformation by an enormous majority in spite of republican risings and intimidation.

This success, which should have consolidated the empire, determined its downfall. A diplomatic triumph seemed essential to complete the success. To the empress was ascribed the saying: "Unless there is a war my son will never be emperor." On July 3, 1870 the opportunity presented itself with the candidature of a Hohenzollern prince for the throne of Spain. To the French it seemed that Prussia, barely mistress of Germany, was reviving against France the traditional policy of the Habsburgs. Ollivier's liberal ministry was desirous of showing itself as jealous for the national honour as any of its absolutist predecessors. Carried away by the force of public opinion which it had itself set free, it accepted war as inevitable and prepared for it "*d'un cœur*

léger."¹ It was in vain that French diplomacy, aided by the uneasiness of Europe, secured the withdrawal of the Hohenzollern candidature. This did not suit either the war-party in Paris, or Bismarck, who wanted the other side to declare war. To preserve their popularity, Ollivier and Gramont, the minister for foreign affairs, sought to extort from King William one of those promises for the future which are humiliating, but never binding. Thus they afforded Prussia the desired pretext for returning a refusal, which Bismarck in the "edited" telegram from Ems transformed into an insult. The Chamber, which was composed of government deputies, notwithstanding the desperate efforts of Thiers and Gambetta, and the 11th-hour offers of mediation on the part of England, fell into the trap and voted for war, which was declared on July 19, 1870.

The War of 1870-71.—Thanks more to the duplicity of Napoleon than that of Bismarck, France found herself isolated; she did not possess a single ally. Through revenge for her defeat in the Crimea, Russia gave Prussia a free hand; while Bismarck's disclosure of the "Benedetti" claim of 1867 on Belgium and Luxembourg, secured for Prussia the benevolent neutrality of England. The emperor counted, at least, on the support of Austria and Italy, with whom he had been in negotiation since the Salzburg interview (Aug. 1867). Italy did not even wait for the defeat of France before entering Rome; Austria, while concerned to take revenge for Sadowa, was distrustful of Napoleon and conscious of the strength of Prussia. The armies of Marshal Leboeuf were no more effective than the alliances of Gramont. All was ready in Germany for the mobilization of a well-equipped and disciplined army under the leadership of experienced generals. All this was lacking in France, where everything had been left to the good luck that had always attended the emperor, and where the army was badly officered and the supreme command entrusted to incapable hands. Thus it was that defeat came with a terrifying swiftness. The battles of Froeschwiller and Forbach (Wörth and Spicheren) were lost on Aug. 6, and on Aug. 18 the "Army of the Rhine" was shut up in Metz. MacMahon's army, which had been given the task of relieving it, was in its turn surrounded at Sedan (Aug. 30) where it surrendered with the emperor on Sept. 2. The capitulation of Sedan destroyed the empire by removing its sole support, the army. Paris was left unprotected and empty of troops. With a helpless woman at the Tuileries, a terrified Assembly at the Palais Bourbon, a ministry, that of Palikao, without authority, and leaders of the opposition who fled at the approach of disaster, the republicans had no need to overthrow the empire. It fell of its own accord on Sept. 4 without a single hand being raised in its defence. (See FRANCO-GERMAN WAR.)

THE THIRD REPUBLIC

The Government of National Defence.—This overthrow of the empire on Sept. 4 resembled in certain respects the revolution of 1830. After the disappearance of Napoleon, the republicans proclaimed the Republic in the Hotel de Ville, and in order to deprive the revolutionaries of power set up a Government of National Defence, presided over by Trochu. But, as in 1830, this bourgeois dictatorship was divided. Moderates like Simon, Favre and Picard thought that the greatest need was to end the hopeless war. Another section, led by Gambetta, and faithful to Jacobin traditions, desired to carry on to the death. The Moderates held the naive belief that peace could be obtained simply by the payment of a large indemnity. At his interview with Bismarck at Ferrières (Sept. 18), Favre soon realized that, as in 1814, it was against France and not against Napoleon, and for the possession of Alsace, that Germany was waging war. The failure to obtain an honourable peace strengthened the hands of warlike party, and the war preparations were resumed. Since Bismarck refused to negotiate for peace except with a constitu-

¹In the 14th volume of his *L'Empire libéral* (1909) M. Emile Ollivier gives a detailed and illuminating account of the events that led up to the war. He indignantly denies that he ever meant that he contemplated it "with a light heart," and says that he disapproved of Gramont's demand for "guarantees" to which he was not privy. His object is to prove that France was entrapped by Bismarck into a position in which she was bound in honour to declare war. (Ed.)

nationally-elected Government, and Gambetta feared that elections would result in the return of anti-republicans and pacifists, an election was postponed.

The Siege of Paris.—On Sept. 19 the German armies invested Paris. Isolated from the rest of France, filled with illusions as to the value of the *sortie en masse*, agitated by social revolutionaries. Paris was about to undergo a siege of four months. The Government, shut up in the capital, maintained merely a delegation at Tours, which demanded an immediate election. To obviate a rupture and put life into the national resistance, Gambetta escaped from Paris in a balloon. A real dictator, he organized, with the help of Freycinet, armies, as in 1793, to raise the siege of Paris and repel the invader. It was a forlorn hope. But, at any rate, it preserved the honour of France and taught the Germans prudence.

Little by little hope faded away. Thiers, who had been sent on a mission to seek the intervention of Europe, everywhere encountered refusals. After this diplomatic defeat, forgetting his duty as a soldier in his ambition to play the politician, Bazaine surrendered the last remaining army at Metz on Oct. 27. When the news of his treason, coupled with rumours of an armistice, reached Paris, already disappointed by the failure of the Bourget *sortie* and suffering acutely from the scarcity of food, feeling rose high in favour of the revolutionaries who, too, were demanding an election and the creation of a Commune. On the initiative of Blanqui, a veteran in revolution, there broke out in Paris on Oct. 31 a rebellion that was suppressed with difficulty. The bad winter of 1870-71 was as dangerous an enemy as the Germans to the armies of *mobiles*, hurriedly raised to relieve Paris. Notwithstanding the heroism of the troops and the energy of their commanders, the new armies were successively defeated. After a temporary victory at Coulmiers Chanzy was forced to fall back from the Loire to Mans under the pressure of the army of Prince Frederick Charles, freed by the surrender of Metz; at the same time, Champigny, who was marching to his aid, was defeated; and in the same way Faiderbe was defeated in the north, despite a victory at Bapaume, even as Bourbaki was defeated in the east after his success at Villersexel. The bombardment of Paris began on Jan. 5 and food supplies failed. The German empire was proclaimed at Versailles on the 18th, and the failure of a desperate *sortie* under Buzenval provoked a new insurrection on Jan. 21.

The Moderates had rejected a proposed Anglo-Austro-Italian intervention at the end of October in the hope that better terms might be obtained by direct negotiation with Bismarck than by imitating Talleyrand's policy in 1814. But they were forced to capitulate by the armistice of Jan. 28, 1871, and to proceed at once to the election of a National Assembly by whom the question of peace or war should be finally decided. The strife between the parties proceeded unabated at Bordeaux. Hostile to any suggestion of a loss of territory, Gambetta wished to take advantage of the armistice to prosecute the war to the bitter end. But Thiers, whose influence over the Moderates increased daily, replied by pointing out to him the hasty and temporary character of his work; the general desire for peace and order; the unity of the nation in the face of anarchy and the federalist leagues in the south. To avoid adding a civil war to that already in progress Gambetta resigned. The Republican party was, therefore, divided at the ballot. At the ensuing elections (Feb. 8, 1871), the war-party, except in Paris, was defeated.

The National Assembly.—The National Assembly contained a Legitimist and Orleanist majority; but the latter were no more successful than in 1851 in restoring the monarchy. Divided as hitherto by memories of 1830, they were specially concerned in leaving a temporary Government to shoulder the responsibility for concluding a peace that would mutilate, and perhaps destroy, France; and they sought to defend the future monarchy from the reproach—which had done such harm to the Bourbons—of having returned in the baggage-wagons of a foreign power; hence they postponed the restoration of the monarchy by the *pacte de Bordeaux*. The provisional Republic continued therefore to exist with Thiers as head of the executive. After the peace the Re-

public re-established that civil order disrupted by the Commune, and having taken the responsibility, was to reap the reward. Its first task was to conclude peace. In truth Favre and Thiers submitted to the Prussian terms without seeking to take advantage of the support of the neutrals or of the Conference of London. They had to cede Alsace, with a part of Lorraine, and submit to a German military occupation pending the payment of a war indemnity of five milliards, despite the protests of representatives of the people thus torn away from France and of the hostile vote of 107 advanced Republicans. But to these hard terms, Bismarck added another, equally grave, for no other purpose than the satisfying of Prussian pride; the formal entry of the German army into Paris. Practically all the deputies from the capital had voted against peace, and Paris was hostile to an Assembly composed for the most part of conservative and pacifist representatives from the provinces. She united in a bizarre alliance the traditions of the patriotic Revolution with the ideology of the socialist International. The wind of insurrection fanned a population which had been furnished with arms to withstand the siege and which no one had dared to disarm. When the Bordeaux Assembly went to Versailles for the same reasons as the States-General in 1789, Paris saw in it a mark of defiance or a threat of a Restoration.

Paris responded (March 18) with the insurrection of the Commune (*q.v.*), and the Government was obliged to retake the city by force of arms, though it was not until May 21 that the Versailles troops entered the city. The merciless repression that followed exceeded that of the June days and destroyed the revolutionary party.

The Treaty of Frankfurt.—The treaty of Frankfurt was signed on May 10, and both the civil war and the war with Germany terminated on that day. Henceforth one thought alone was present in every French mind—to pay the indemnity and deliver French soil from the heel of the invader. To the honour of Thiers' government, aided by the whole nation, the first loan raised for this purpose in June 1871 was oversubscribed two and a half times. Gambetta himself rallied to the conservative republic, and after the supplemental elections of July, 1871, which returned 100 moderate Republicans to the Assembly, founded the Opportunist Party.

Thiers.—For a year and a half the Right Centre accepted Thiers' government and collaborated in its work of reorganization, although not without some skirmishes such as the abrogation of the laws which exiled the princes of the blood and interpellations in favour of the temporal power of the pope. But little by little they came into disagreement with him over his home policy and the constitutional issue. Once the effacement of the grandson of Louis Philippe in favour of the grandson of Charles X. had been effected, they thought the time had come to restore the monarchy. Suddenly, however, his manifesto in favour of the White Flag brought about a disagreement between the Comte de Chambord and the Assembly which wished to offer him the crown. For five years France was afforded the spectacle of a majority that could not agree with the legitimate ruler and which, unable to restore the monarchy, sought at least to prevent the establishment of the Republic.

The Republic was indeed alive, and, by reason of the propaganda of Gambetta, the country gradually turned towards it and each by-election strengthened its position. The second loan of three milliards, which was 14 times over-subscribed, not only in France but abroad, and the law of conscription, guaranteed to France the early evacuation of her soil by the Germans and the rehabilitation of her army. Nevertheless when Thiers, who was a monarchist by conviction, raised the constitutional issue in Nov. 1872 and pronounced in favour of the Republic, the Commission of Thirty, which was charged with the duty of drafting the law for the regulation of public powers, retorted by seeking to exclude his personal intervention in the debates. As he had introduced three Republicans into his cabinet, the coalition of the parties of the Right, by demanding that he should pursue a conservative policy, brought about his resignation (May 24, 1873).

MacMahon.—The coalition replaced Thiers with MacMahon,

and an Orleanist, the duc de Broglie, formed a fighting ministry for the purpose of restoring that "moral order" that had been upset by the Radicals. All preparations had been made for the establishment of a constitutional monarchy when, on Oct. 27, the comte de Chambord for a second time refused to become the "legitimist king of the revolution."

While awaiting his abdication or death the astonished Royalists concentrated upon prolonging the temporary character of the Republic, and elected MacMahon to the presidency for seven years that he might act, as they thought, as the lieutenant-governor for the future king. But his government was agreed only on negations. It would not suffer the Republicans to come into power; it would not re-establish the Republic; and it would not control the activity of the clergy even when such activity created difficulties with Italy or with Bismarck. But no government can subsist upon negations, and the Bonapartist party took the opportunity to reorganize itself; while at the close of 1874, the elections to the municipal councils amounted to a plébiscite in favour of the Republic, a success due to the appeals made by Gambetta to the *nouvelles couches sociales*.

The Constitution of 1875.—In spite of itself the Assembly was forced to make a constitution. Despite the Septennat, and a senate that was not even elected by universal suffrage, Gambetta, who had broken with the Radicals, the partisans of a policy of all or nothing, succeeded in persuading the Left to accept a constitution that was drafted by the Monarchists and the Moderates. On Jan. 30, 1875, Wallon's amendment, in which the name of the Republic was mentioned, was passed by a majority of one. Thus came into existence the constitution that has lasted longer than any of those that France has tried since 1792. It preserved to France as indisputable principles of public right the sovereignty of the nation as exercised by the Chamber, the liberty of the press, universal suffrage, trial by jury and the right of public meeting. This constitution maintained the social order of the Revolution and the administrative order of Napoleon.

The legislative power was conferred on a senate and a chamber of deputies, which might unite in congress to revise the constitution, if they both agreed that revision was necessary, and which were bound so to meet for the election of the president of the Republic when a vacancy occurred. It was enacted that the president so elected should retain office for seven years, and be eligible for re-election at the end of his term. He was also held to be irresponsible, except in the case of high treason. The other principal prerogatives bestowed on the presidential office by the constitution of 1875 were the right of initiating laws concurrently with the members of the two chambers; the promulgation of the laws; the right of dissolving the chamber of deputies before its legal term on the advice of the senate, and that of adjourning the sittings of both houses for a month; the right of pardon; the disposal of the armed forces of the country; the reception of diplomatic envoys, and, under certain limitations, the power to ratify treaties. The constitution relieved the president of the responsibility of private patronage, by providing that every act of his should be countersigned by a minister. The constitutional law provided that the senate should consist of 300 members, 75 being nominated for life by the National Assembly, and the remaining 225 elected for nine years by the departments and the colonies. Vacancies among the life members, after the dissolution of the National Assembly, were filled by the senate until 1884, when the nominative system was abolished, though the survivors of it were not disturbed. The law of 1875 enacted that the elected senators, who were distributed among the departments on a rough basis of population, should be elected for nine years, a third of them retiring triennially. It was provided that the senatorial electors in each department should be the deputies, the members of the *conseil général* and of the *conseils d'arrondissement*, and delegates nominated by the municipal councils of each commune. As the municipal delegates composed the majority in each electoral college, Gambetta called the senate the grand council of the communes; but in practice the senators elected have always been the nominees of the local deputies and of the departmental councillors (*conseillers généraux*).

The constitutional law further provided that the deputies should be elected to the chamber for four years by the direct manhood suffrage that had been enjoyed in France ever since 1848. The laws relating to registration, which is of admirable simplicity in France, were left practically the same as under the Second Empire. From 1875 to 1885 the elections were held on the basis of *scrutin d'arrondissement*, each department being divided into single-member districts. In 1885 *scrutin de liste* was tried, the department being the electoral unit, and each elector having as many votes as there were seats ascribed to the department without the power to cumulate—like the voting in the city of London when it returned four members. In 1889 *scrutin d'arrondissement* was resumed. The payment of members continued as under the Second Empire, the salary now being fixed at 9,000 francs a year in both houses. The senate and the chamber were endowed with almost identical powers; the only important advantage given to the popular house in the paper constitution was its initiative in matters of finance, but the right of rejecting or of modifying the financial proposals of the chamber was successfully upheld by the senate. In reality the chamber of deputies has overshadowed the upper house. The constitution did not prescribe that ministers should be selected from either house of parliament, but in practice the deputies have been in cabinets in the proportion of five to one in excess of the senators. Similarly the very numerous ministerial crises which have taken place under the Third Republic have, with the rarest exceptions, been caused by votes in the lower chamber. Among minor differences between the two houses ordained by the constitution was the legal minimum age of their members, that of senators being 40, and of deputies 25. It was enacted, moreover, that the senate, by presidential decree, could be constituted a high court for the trial of certain offences against the security of the state.

The Republicans.—Nevertheless the Republic remained the republic without the republicans. President MacMahon who had been chosen by the monarchical Right, thought himself bound in honour to govern in accordance with their views. After the elections of Feb. 1876, however, although there was a slight conservative majority in the senate there was a republican majority of more than 200 in the chamber, but the monarchists were not cast down by this defeat. No longer able to discuss the constitution, they struggled to secure control of it in order to prevent it from functioning, and they pursued their policy on behalf of the clergy. The Republicans, on their part, dividing up into the Left Centre, Republican Left and Radical Left, took the offensive in order to compel the president to follow a republican policy, and he was forced to form a ministry from the Left Centre. The chamber restored the liberty of the press and the right of the municipalities to elect their mayors, and finally pronounced itself strongly against the demonstrations of the Ultramontanians in favour of the temporal power. This brought about a rupture. The president replaced the Simon ministry by the conservative ministry of the duc de Broglie and Fourtou, and caused the senate to dissolve the chamber (May 16, 1877). The Union of the Left immediately formed itself anew and addressed to the country a common manifesto, signed by 363 deputies. In this it appeared as the conservator of peace and order against the revolutionary coalition of the monarchical and clerical parties and of the sovereignty of the people against the personal government of the president. In the elections of Oct. 1877 the *Union des Gauches* won the battle; MacMahon was forced to give way and then to resign; Grévy was elected to succeed him (Jan. 1879), and the control of the republic passed into the hands of the republicans who were masters both of the senate and the chamber.

The republicans, although they had united to defend themselves, split up again when called to office. The Left Centre lacked popular support and was of no importance except in the senate where it combined with the Right to oppose the measures against the clergy. The majority in the Chamber was shared between two groups: the Republican Left and Gambetta's old Extreme Left, now become the *Union Républicaine*. The experience of victory had rendered them more moderate, and they had to fear the possible formation of a party of order directed against

them. President Grévy, in his first public announcement, reassured the propertied classes with a slogan of "liberalism truly conservative," while Gambetta instilled into the Radicals the necessity for discipline and patience. But almost at once there arose from among the Radicals a new Extreme Left, the heir to the Jacobins, which was led by Clemenceau, who reproached Gambetta and his party with opportunism while awaiting the resurrection of Socialism. Henceforth the two parties fought bitterly among themselves, and from this arose the instability of ministries. Anti-clericalism was the sole bond of union between the parties of the Left.

Anti-clericalism.—Anti-clericalism came into evidence after 1880 as a means of revenge for the 16th of May and for the support given by the clergy to the enemies of the Republic during the whole life of the National Assembly. It was also inspired by the necessity to protect the rights of the State against a Catholicism that was not only religious, but also political. Under the leadership of Jules Ferry, this anti-clericalism was expressed in the decrees by which unauthorized religious houses were ordered to disperse. On their refusal they were expelled; and the Jesuits first of all. Henceforth a state of war existed between the Republic and the Catholic Clergy, and the next field of battle was the education question. Free, lay and compulsory primary education was organized; later certain of the privileges which had been enjoyed by uncontrolled education under the Falloux law of 1850 and that of 1875, were withdrawn—granting of university degrees, and liberty of teaching for unauthorized congregations. This was the object of the famous article 7 that aroused the fury both of the republicans of the Extreme Left for whom anti-clericalism meant anti-catholicism, and of the monarchists who saw in this clause the prelude to the complete prohibition of education by the clergy. Finally the law of 1881 set up entire freedom of the press, and that of 1884 on the trade unions enabled the working classes to create organizations similar to the English trade unions.

Republican Divisions.—When anti-clericalism had triumphed the republicans were divided over foreign and home policy. One party which accepted, even though temporarily, the defeat of 1870–71, was disposed more or less publicly to come to an understanding with the German empire, and to seek in colonial expansion both fresh economic resources and a relief from a policy of reconstruction that threatened to become one of effacement. Others, refusing to accept the *fait accompli*, believed that French policy should remain European, that the danger of invasion—revealed in the war-scare of 1875—still existed, and that a strong army and as many allies as possible were needed to oppose Germany strengthened by the Triple Alliance. The same disagreement showed itself in home policy. The *Union Républicaine*, being now in power, avoided offending conservative instincts, and toned down the traditional radical demands; but their proffered compromise was rejected by the advanced republicans, who put forward a fighting programme. During 1880–84 the internal history of France was dominated by these two warring policies.

The conflict with the Extreme Left was brought to a head after 1880 by the voting of the amnesty to the members of the Commune (1880) which it enforced. With their return to France began the reconstitution of the Revolutionary Socialist Party. In the elections of 1881, in which the republicans once again obtained a majority and eliminated the Conservative Party from the political arena, the Extreme Left were the greatest gainers. Formerly the idol of Paris, Gambetta was, with difficulty, returned for Belleville. As leader of the majority he agreed to form what came to be known as the "great cabinet" which lasted for three months; but the Extreme Left immediately displayed its hostility towards his opportunist policy and launched out on a campaign of calumny in which he was accused of desiring war and aspiring to a dictatorship. With his downfall, and a little later his death (1882), there disappeared his dream of a national and free republic.

The successive ministries of Freycinet, Duclerc and Ferry experienced the same pressure from the Extreme Left. To avoid an elective magistracy, they were forced to purge it; to avoid a

complete revision of the constitution and the suppression of the senate, they were forced to agree to the suppression of its life members and the increase of those elected (1884). They were successful in substituting the agreements of 1883 for the nationalization of the railways and they abandoned the income tax. But it was in the sphere of colonial policy that the fiercest fights were waged, and it was over this question that the unity of the republican party was permanently dissolved.

The expedition to Tongking, after that to Tunis, provoked the long crisis that lasted from 1885–89. The disciples of a patriotic Jacobinism and the minority of the Right formed the enemies of the Ferry government which, as a result of the panic provoked by false news of the check by the Chinese at Langson, they succeeded in overthrowing in May 1885.

The Coalition Ministries (1885–89).—Until 1889 one coalition ministry succeeded another. Since it had come into power the Left had abandoned the wise and conservative financial policy of balanced budgets, redemption of debt and economy. Freycinet's grandiose railway scheme and plans for public works, the colonial expeditions and the education laws had disorganized the finances. The crash of the *Union Générale* in 1882 had spread anxiety and discontent in the provinces which showed itself in the elections of Oct. 1885, held under the *scrutin de liste* by the republicans, who presented two rival lists, and resulting in the victory of 200 deputies of the Right united on a negative policy of liberal opposition. Split up into two almost equal factions, the Republican Party had lost its majority, and in order to carry on the Government, was forced to resort to two policies—the one of concentration against the Right, which was adopted by the ministries of Brisson (who succeeded J. Ferry), Freycinet (Jan. 1886) and Goblet (Dec. 1886), and the other a lenitive policy by which the conservatives were induced to support the governmental republicans against the Radicals, which was pursued by Rouvier (May 1887) and abandoned by Goblet (Dec. 1887). The early ministries (Ferry, Freycinet, Goblet), expelled the pretenders in order to strike at the comte de Paris; the later ministries, too preoccupied in retaining their authority to trouble themselves with reform, endeavoured to terminate the policy of colonial expansion and to balance the budget.

General Boulanger.—A new opposition of a hitherto unknown nature arose to threaten the republic. Its hero was General Boulanger. To oppose Ferry's colonial policy the Radicals had allied themselves with the Patriots, who were advocates of a war of revenge with Germany, and had pushed into the ministry of war the "only Republican general," Boulanger (Jan. 1886). This plausible and handsome adventurer had won renown by his democratic professions and made himself popular in a radical and patriotic Paris by expunging from the list of officers the names of the Orleanist princes. Bismarck took advantage of the popularity of Boulanger to extort from the Reichstag fresh military credits, and France was brought within an ace of war by Boulanger's demand of a bold reply to the arrest of the French official, Schnaebelé, near the German frontier (April 1887). The Opportunist Party, which took over the Government in May, removed Boulanger to Clermont-Ferrand and broke with the Radicals who were his supporters. Unhappily, a scandal over decorations gave fresh impetus to the Boulangist movement and led to the resignation of President Grévy and his replacement in December by the moderate Republican Carnot.

Carnot's ministries, that of Tirard (Dec. 1887) and Floquet (April 1888) followed a policy of concentration of the republicans against the Boulangist movement. Placed on retired pay and, therefore, rendered eligible to the chamber, Boulanger revealed himself little by little as the enemy of the corrupt and incompetent republican Government, and as an aspirant to dictatorship. That old enemy of the empire, Rochefort, who had been involved in the commune, brought to Boulanger's aid all the extreme elements in the population. The Conservative Catholic Party joined itself to the Revisionist Party to support Boulanger in "making a hole in the republic," and on Jan. 27, 1889, along with many departments, Paris elected the general by an enormous majority and amidst scenes of delirious enthusiasm.

His success killed Boulanger: he feared to march on the Elysée in the confidence that the result of the general election would be virtually a plébiscite in his favour. At once the *Union des Gauches* reappeared as on May 16; against him, the Tirard-Constant ministry (Feb. 1889) re-established the *scrutin d'arrondissement*, forbade multiple candidatures, and impeached him before the high court of the senate. Boulanger fled to Brussels. The hostility towards him of the peasants who feared a war, the calming effect induced by the exhibition of 1889, the union of the Republican parties with the result that not 40 Revisionists were elected in Oct. 1889, and, finally, the suicide of Boulanger in April 1891, completed the destruction of the movement.

The Franco-Russian Alliance.—The elections had been fought by the parliamentary republicans in order to protect the constitution of 1875 from the attacks of the Revisionists and Monarchists, and the education and military laws from that of the Catholics. Once in power they pursued a policy of conservation and republican concentration. One great political event alone marks the ensuing four years—the establishment of a customs tariff in 1892 in contrast to the commercial treaties of Napoleon III. In vanquishing Boulanger they had learnt a lesson that they were prompt to apply in negotiating the Franco-Russian alliance, and so satisfying the national fears that had caused the unpopularity of Ferry and the popularity of Boulanger. Adumbrated by Decazes, planned by Gambetta in 1875, demanded by Boulanger and his party, the alliance was born after the fall of Bismarck in 1890, confirmed at Cronstadt in 1891 and formally recognized in 1893. The Franco-Russian alliance, the purely defensive counterpart of the Triple Alliance, affirmed anew that the safety of France did not depend solely on the goodwill of others, but on herself, her army and her alliances; and at all events not on an *entente* with a Germany which was continuing to arm. The alliance strengthened the republic by guaranteeing peace through a balance of power. It disarmed the patriotic or nationalist opposition; the Radicals were reduced to an insignificant and unimportant minority; the socialist Labour party became impotent through its own internal divisions into Marxists, Possibilists, Broussists, etc.; the Conservative party was also rendered powerless. A number of conservatives, on the suggestion of the comte de Paris, after his identification with the Boulangists, had recognized, as had the Bonapartists, the revolutionary principle of the sovereignty of the people. Abandoning the idea of restoring the monarchy, they no longer attacked the republic but solely its administrators and policy. Some went still further and, in response to an appeal from Leo XIII., adhered to the republic without strengthening it, accepting the constitution merely to modify the legislation (1892).

The Panama Scandal.—Thanks to this development and to the pursuit of a policy of moderation, a reconciliation was effected between the Conservative Right and the Republican Centre. The reconciliation was rendered still more easy of attainment by the willingness of the Right to accept the education and military laws; but it was less easy to effect in the constituencies, where the republican electors were still hostile to the conservatives who had fought the Republic in 1889. The majority of the conservatives remained faithful to the royalist tradition, and protested against the policy of Leo XIII. In the autumn of 1892 they drew attention to the serious Panama scandal; in November the Panama Company was accused of having, in 1888, bribed a minister and certain deputies in order to obtain permission to issue shares. The scandal, which was grossly exaggerated in the press, opened up an era of denunciations, enquiries and judicial prosecutions. In the result, certain leaders of the Left, including both Clemenceau and Floquet, were forced to retire and a new generation appeared which, never having fought for the Republic, was more disposed to entertain friendly relations with its old enemies.

The Moderate Ministries (1893–98).—For five years almost without a break one moderate ministry succeeded another—Dupuy, Méline, etc.—ministries so moderate in policy that, after the assassination of President Carnot by an Italian anarchist in 1894, Casimir-Périer, grandson of Louis Philippe's reactionary minister, was chosen president by a huge majority over the radical candidate, Brisson.

This new development was made manifest in the elections of 1893, when the Right won only 93 seats of which 33 were occupied by deputies who supported the Republic; the ministerial Republicans held 300; the Radicals 130; while the socialist opposition, united for once, gained 48 seats and composed the first socialist parliamentary group. Moreover the majority of the deputies were new to political life. The political balance of power was upset by the Anarchist party who had dissociated themselves from the Socialists after the congress of 1879. Hostile to all parliamentary or electoral government, they carried on propaganda by explosives, after the manner of the Russian terrorists. The exceptional measures passed in 1893 and 1894 made short work of this propaganda. Then the Socialists attacked the upper middle classes in the person of Casimir-Périer, who resigned after a few months from a presidency in which he had been rendered powerless, and was succeeded by another moderate bourgeois in Félix Faure. The Radical ministry of Léon Bourgeois was overthrown by the enmity of the senate towards the imposition of an income tax, and was succeeded for two years by the moderate coalition ministry of Méline, supported by the neutrality of the Right. Despite the attacks of the Radicals on his financial policy, and the coalition between the Socialist factions that was definitely concluded by Millerand at Saint-Mandé (May 1896) on a programme of social reform unaccompanied by revolution, Méline carried out his policy, which was neither revolutionary nor reactionary. It required two violent crises to remove the conservative Republicans from power; the one in home affairs, the other in foreign policy.

The Dreyfus Case.—Méline was still in office when the Dreyfus case came to upset the balance of power between the parties. A Jewish captain on the headquarters staff was accused of having sold military secrets to Germany and was condemned for treason in 1894. France was divided into two camps: the supporters and the accusers of Dreyfus. A state of civil war was almost reached that resembled in a less violent form the great crises in French history and that brought even the intellectual elements in the nation into the arena. For three years the revision of the sentence on Dreyfus, which was demanded by Scheurer-Kestner and by Zola in his letter *J'accuse*, completely dominated French politics. Those who believed him guilty nearly all allied themselves with the Right, while his defenders were mainly to be found in the ranks of the left. The former took as their motto: "Vive l'armée!"; the latter exclaimed with Jaurès and Clemenceau: "Vive la République!" The conflict became acute in 1899, after the sudden death of President Faure, who had secretly opposed a re-trial. Loubet was elected president in face of the opposition of the nationalist *Ligue de la patrie française* and of the conservatives, and was ill-received by a nationalist Paris. Déroulède, the president of the League, attempted on the day of Faure's funeral to achieve a *coup d'état*, but failed. After the sentence on Dreyfus had been quashed, Loubet was assaulted on the race-course at Auteuil.

As in the days of Boulanger and on May 16, the Left groups coalesced to defend the Republic. The moderate, though revisionist, ministry of Waldeck-Rousseau, in which Millerand held the portfolio of commerce, and General de Gallifet that of war, appealed to all the republicans for support. It was nicknamed the Bloc by Clemenceau, and was this time to wander far to the Left (June 1899). Two reasons underlay their policy. The first was that the Socialist party in France had become, by the entrance of Millerand into the ministry, the extreme wing of the Republican party. The second is to be found in the fact that the Dreyfus case showed that anti-militarism was powerful and greatly aggravated by the boredom of a military life in which no differentiation was made between the peasant and the scholar. Thus it came about that the Republican party, intensely patriotic, in 1870, gradually tended under the pressure both of internationalism and selfishness to allot the second place to national defence.

Anti-clericalism and the Combes Ministry.—The Bloc was still held together by anti-clericalism. The nationalist agitation against the Jews and the Freemasons had been strongly sup-

ported by the Assumptionists and by the Jesuits. The education of the upper classes was passing steadily into the hands of these religious orders. Too rich, too powerful and too numerous, these intriguing clerics met with the fate of the Templars in the reign of Philip the Fair. The Law of 1901 for the first time granted in France the full right to found free associations; but the formation of religious congregations was permitted only by the passage of a special law, and their dissolution could be effected by decree.

When Waldeck-Rousseau was succeeded by E. Combes in 1902, the latter, supported by a Radical-Socialist and Socialist majority that had been returned in the elections held on the question of the congregations, abandoned the defensive methods of the republicans and adopted an aggressive policy of anti-clericalism. Not content with subjecting them to surveillance, he suppressed nearly all the congregations, took away their right of education, and disposed of their property. Following upon a papal protest against President Loubet's visit to the king of Italy and a dispute over the nomination of bishops, Combes broke off diplomatic relations with the Holy See and brought forward in Nov. 1904 a plan for the separation of the Churches from the State. But the Left coalition, which had been his support, eventually broke up. On the right wing of the party many progressive republicans were disturbed by a religious war which divided the country and brought *a priori* suspicion upon Frenchmen who did not share the views of the government. Others were offended by the socialist alliance, and a number of Radicals were irritated by the discipline imposed upon them by Combes. On the left wing, influenced by the International Socialist Congress of Amsterdam (Aug. 1904), the French Socialist party, led by Jaurès and Briand, had been forced to give in to Marxist theories and to transform itself into a united socialist party devoted to class warfare and revolution. It at once seceded from the Left. Combes' already diminishing majority vanished with the introduction by General André of politics into the army by the system of espionage; and the prime minister himself was forced to admit that his representatives had acted as a political police in the army. In Jan. 1905 Doumer, the candidate put forward by the opposition, was elected president of the chamber, and the ministry fell beneath the blows of the socialist, Millerand.

Delcassé.—An opportunist, Rouvier, succeeded Combes and continued his anti-clerical policy with less asperity, but with an equal indifference to foreign affairs. The separation of the Churches from the State was passed with the support of the socialist, Briand, but its application raised great difficulties. During this period of agitation and instability, Delcassé, who was faithful to the Radical tradition of opposition to distant adventures and to *rapprochement* with Germany, worked freely at the ministry of foreign affairs to neutralize this policy. In 1899 he brought about a reconciliation between England and France by the settlement of the Fashoda incident; in 1902 he obtained the neutrality of Italy; in 1904, aided by King Edward VII., he settled all colonial disputes with England, and in exchange for the abandonment of Egypt, obtained the right to complete the French empire in northern Africa by the protectorate of Morocco. But, encouraged by the defeat of Russia by the Japanese in Manchuria, the Emperor William II. endeavoured by his visit to Tangiers to inflict a defeat upon the other member of the alliance. He was successful in that Delcassé, advocating resistance, was disavowed by his colleagues in the ministry and resigned (June 1905). The Algéciras Conference (*q.v.*), by recognizing French claims in Morocco, averted a war that France would have found difficult to wage. Henceforth until 1914 France lived in the expectation of an attack on the part of a warlike and imperialist Germany which saw in every diplomatic or military defensive action, justification for believing that she was being encircled and therefore must arm herself still more.

Syndicalism.—Meanwhile, French democracy shelved the Alsace-Lorraine question and reduced the period of military service to two years. Full of international ideals, it believed that it would assure peace merely by being pacific. Only against itself was it aggressive. By establishing the General Confederation of Labour in 1895 the workers had introduced a new method of op-

position into political life. Up till that time the Socialists had sought to win political power by gaining a majority in the assembly and the government; the Syndicalists sought to achieve revolution at a blow by a general strike that should shatter both capitalism and the State. They preached social war instead of national wars, and organized strikes in the army, direct action and sabotage.

1906-14.—The elections of May 1906 fought on the Separation policy, resulted in a brilliant, but ephemeral success for the Bloc. The Radical ministry of Clemenceau and Caillaux sought to reconcile two contradictory policies. Clemenceau favoured the *entente* with England and Caillaux the *rapprochement* with Germany. The former desired to complete the work of separation; the latter to impose an income tax. The ministry met the chamber with a vast programme of reforms not one of which it was able to realize. It at once came into conflict with the Confederation of Labour, which stirred up a continual agitation among the workmen and officials: first there were strikes of labourers at Draveil and of vine-dressers in the south, which had to be suppressed by force; then the school-teachers and postal workers endeavoured to form a union and claimed the right to strike. These events caused Clemenceau to adopt an attitude of growing hostility towards the Socialists. It was only by a series of makeshifts that he was enabled to set up an ecclesiastical system on the basis of toleration, but lacking legal title. When Caillaux, faced with a financial situation which had again become acute since the return of the Radicals to power, sought to cover the deficit by the imposition of a progressive income tax, he came up against the Moderates. The ministry fell in July 1909. The ministerial instability of 1885-89 reappeared in an aggravated form. In the period 1910-14 eight ministries succeeded one another, paralyzed rather than supported by majorities obtained by fragile and heterogeneous coalitions. The Bloc dissolved in face of the attacks, both of the Socialists led by Jaurès and of the supporters of proportional representation, that is to say, of the right of minorities, against the Radicals who were devoted to the *scrutin d'arrondissement*. The two ministries of Briand (July 1909-Feb. 1911) were marked by the energetic repression of the general strike of railway workers, and the regulation of the separation of the Churches from the State. Then came the ministry of Monis—which was overthrown through an aeroplane accident in which the war minister was killed outright and Monis seriously injured (May 1911)—and of Caillaux, who fell through the Agadir incident. As the Left majority gradually diminished Poincaré came into power in Jan. 1912, pledged to follow a national policy. When on the expiration of Fallières' term of office, Poincaré was chosen over Pams, the candidate of the Left, to succeed him as president of the republic, a third ministry of Briand lasted two months before giving way to the progressivist Barthou. Barthou, alarmed by the extraordinary military credits demanded from the Reichstag for the increase of the army, sought to re-establish the three years' service in face of a coalition of the Radicals and Internationalists. This conflict brought about the revival of the *Bloc des Gauches* led by Caillaux, president of the committee of the rue de Valois, who had for their programme two years' military service, the secularization of the Church properties and an income tax. Defeated in the chamber Barthou yielded place to Doumergue, whose plan for proportional representation and fiscal reform was rejected by the senate. In the elections in May 1914 the Left group gained a majority, and the ministry of Ribot, after a life of 24 hours, gave way to that of Viviani. The thunderbolt of Serajevo shattered this political kaleidoscope (June 1914).

Balkan Unrest.—Whilst these conflicts were taking place, an atmosphere of foreboding was rising in Europe (*q.v.*). Germany, threatened by apoplexy in population and industry, was seeking outlets and colonies in all directions. Having failed to break either the Franco-Russian Alliance or the Triple Entente, she grew more and more aggressive. She had shown her temper at the two Hague Peace Conferences in 1899 and in 1907, and had piled up incidents in Morocco, at Tangiers, at Casablanca, at Agadir. Each concession only made her more exacting. Then from Morocco,

where he had not had even the support of Austria, his "brilliant second." William II. turned his attention to the East. The Turkish Revolution of 1908, and the advent of the national (Young Turk) liberals in the place of the Old Turks, had aroused in the Balkans fresh national aspirations dangerous to Austria-Hungary.

In this new sphere German influence received a double setback, military and political, which added to her irritation. The one was the defeat of the Turks, the pupils of German generals, by the coalition of Bulgars, Greeks and Serbs (1912); the other was the downfall of the Bulgars, the allies of Austria (1913). The German government could re-establish its prestige only by military action; hence she increased her army partly to support Austria, but partly also through apprehension of France, whose union with Russia was drawn ever closer. These circumstances had determined the Barthou ministry to increase the term of service to three years in spite of the democratic parties in France, who were loud in protestations of sympathy with the German socialists at their joint meetings in Switzerland, where the Germans, in return, promised not to follow William II.

Austria held that the independence of Serbia was incompatible with the maintenance of her own monarchy. The German Emperor, impulsive, discredited in the eyes of public opinion, hard pressed by the military Junta, desired war in order to recover his prestige. On June 28, 1914, the assassination at Sarajevo provided a sudden opportunity to resuscitate the entire Balkan problem. The Triple Entente was paralyzed: France by the struggles of parties which did not stop short of crime and by "international" propaganda which declared war to be impossible; Russia by widespread strikes; England by the Irish crisis. So little did France realize what was on foot that Poincaré and Viviani were actually visiting the tsar, when the Austrian ultimatum, drawn up after *carte blanche* had been given by Germany in terms that precluded acceptance, was presented to Serbia on July 25. Nevertheless, on the advice of France and the friendly powers, Serbia accepted almost the whole. Austria however decided not only to break off diplomatic relations, but also to declare war on Serbia (July 28). See WAR GUILT for special examination of the facts, also EUROPE.

THE WORLD WAR

Mediation by four powers, direct negotiation, arbitration at The Hague, all were refused. The Austrian mobilization provoked Russia, which proceeded from a partial to a full mobilization. This led Germany to declare war on Russia. She had tried to secure the neutrality of England. She also endeavoured to intimidate France, and prescribed the demand of Toul and Verdun as hostages for the renunciation of the Russian alliance. The French government declared that it would be guided by its own interests alone, made a last appeal to the king of England, whose intervention might possibly still have made Germany stop to reflect, and, on July 30, in order to avoid all appearance of aggression, withdrew her troops to 10 kilometres from the frontier.

On Aug. 2, by his violation of Belgian neutrality, and on the 3rd, by his declaration of war on France, William showed that he understood neither the history of England nor that of France. The former had never tolerated the presence of a great power at the mouth of the Scheldt, and from the time of Louis XIV. to Napoleon, had shown that she would never retire from a conflict until she had been victorious. As for the latter, in one blow, as in all other tragic moments of her destiny, German aggression rebuilt "l'union sacré." On Aug. 4 England declared war on Germany "for the sake of a scrap of paper" and Italy declared her neutrality.

Everybody believed that the war would be a short one, on account of the prodigious military and financial effort entailed. It was to last for more than four years (July 28, 1914–Nov. 11, 1918); it took on the character of a fight to the finish, not only between armies, but between whole nations, and, with an aspect increasingly scientific, industrial and economic, grew to undreamt-of proportions. (For all detail, see WORLD WAR, etc.)

The first period was one of movement; it lasted for four months. The German plan was to force a decision in France by a series of staggering blows and then to turn against Russia. It nearly suc-

ceeded. On Aug. 20 the French offensive was broken at Morhange in Lorraine; on the 22nd the French and the English, who had advanced to help the Belgians, had to withdraw from Mons and Charleroi to the Somme, and thence to the Marne; but there, by one of the most marvellous recoveries known to military history, the foresight of Gallieni, and the imperturbable *sangfroid* of Joffre, they stopped the invasion (Sept. 6–12). The Germans were repulsed a second time, when they attempted to resume their offensive in Flanders, thanks to the battle of the Yser (Oct. 20–Nov. 17).

The second phase brought in the subterranean and murderous war of trenches and battles of attrition. To hold on to the death became the order on both sides of the front, which now extended from the North sea to the Suez canal. The opposing forces were in equilibrium. By reason of her long preparation during years of peace, her splendid organization, her alliance with Turkey, Germany possessed sufficient resources to balance the numerical superiority of the allies and their control of the sea. The year 1915 was spent in fruitless attempts to break through, in Champagne (March–Sept.), and in Artois (May–June), and on the Isonzo after Italy had entered the war against Austria (May 25). It was, moreover, a year of reverses for the Allies in the East; i.e., the Dardanelles where Anglo-French forces unsuccessfully tried to force an entrance into Russia after communication had been cut by the Turks; the overwhelming of the Serbs, thanks to Bulgaria, who joined the Central Powers (Oct. 5); and finally the immobilization in its turn of the Russian front after the conquest of Poland by German and Austrian troops.

Verdun.—1916 was pre-eminently the year of Verdun, the most formidable battle of the war on account of its length (Feb.–Aug.) and of its epic tenacity. Having put Russia out of action, the Germans determined to pierce the French front, or to drain French manhood, and chose this old city, whose very name at once became a symbol. The reverses which the Germans suffered were very costly, however, and caused a change of tactics. They began a series of "peace offensives." Being well supplied with sureties, the Germans hoped to tire out the Allies and to escape from the position with advantage to themselves. The intervention of Rumania (Aug. 28), the vigorous counter-offensive of the Allies on the Somme, and of the Italians at Gorizia, revived the hopes of the Allies, but in vain; in a few weeks Rumania was crushed; and Greece, under Constantine, brother-in-law of William II., seemed to favour the latter; the Russians conquered Armenia, but again the naval battle of Jutland was indecisive, while an English army, shut up by the Turks in Mesopotamia, was obliged to surrender.

And so the war went on, with ever-growing intensity, costing daily thousands of human lives, and swallowing up the capital accumulated for generations.

1917.—Under this appalling strain weariness and demoralization—the revolt on which Germany was counting—began to appear among the allies. Hence 1917 was the most difficult year, less on account of the actual course of the war, than because of political and economic events. Exhausted by her losses and by the allied naval blockade, Germany redoubled her intrigues and attempts to impose peace on her adversaries, and gained formidable help from her unrestricted submarine warfare (Jan. 31) and the Russian Revolution (March). Since she dared not use her battle fleet on the high seas after the battle of Jutland, Germany decided to starve England by sinking all food ships, even those flying a neutral flag. Instead of bringing her victory, the submarine war was fatal to her, for it brought about the intervention of the United States (April 6). But this ally was far away and without an army. Just at the breaking point of the Entente, the October Russian Revolution, overturning the Kerensky Provisional Government of March, caused the final withdrawal of the Russian army from the Allied front.

These events naturally affected France, the chief battleground. Following the check of a new offensive on the Aisne, the attrition of English reserves in Flanders, and finally the Italian disaster at Caporetto (q.v.), mutinies broke out in the army, the spirit of 1914 was weakened behind the front, and rival factions again

OLD FRENCH TOWNS, CHÂTEAUX AND MONASTERIES

1. View of Grenoble, the chief town of the department of the Isère, southern France. It is situated on both banks of the river Isère, at the foot of the mountains of the Grande Chartreuse. 2. Chamonix in the French Alps, with Mt. Blanc in the background. 3. Château de Chambord, near Blois, in northwestern France. An aerial view, showing the profusion of turrets, pinnacles, elaborately carved chimneys and dormers which compose its roofs and form one of its principal points of interest. The present building was begun in 1526 for Francis I., who spent most of his latter years there. 4. Aerial view of the Château de Chenonceaux, Touraine, built over the river Cher. The chateau, which was begun in 1515 on the site of a fortified mill, was given by Henry II. to Diane de Poitiers. It eventually came into the possession of Catherine de Médicis, who added the gallery

above the bridge to the left. 5. Dinan, a mediaeval town in Brittany, at the head of the estuary of the Rance; a favourite resort for foreign visitors. 6. Mont-Saint-Michel, a fortified island abbey on the Norman coast, near the border of Brittany. Tradition places the founding of a monastery here in 708, but the earliest existing remains are from the Benedictine abbey of the 10th century. The Gothic structure called *la Merveille*, of which the long, buttressed wall is seen here, was built in the 13th century. 7. Argentat, a village on the river Dordogne near Tulle, in the south of France. 8. The monastery of La Grande Chartreuse, near Grenoble, until 1901 the parent house of the Carthusian order, founded by St. Bruno in 1084. As a result of repeated fires, few remains of the original monastery exist. The present buildings date from the 17th century.

appeared in parliament. Under a vacillating Government a defeatist peace propaganda, supposed to have been supported by the minister of the interior, was started in the army and behind the front. In order to counteract this, not only was a strong Government necessary, but one that was not likely to be pro-German. Clemenceau, inheritor of the Jacobin tradition of public safety, president of the council in November, 1917, "made war" both at home and abroad, and swept away all the Malvys and Caillaux, while Pétain took the army in hand.

1918.—It was time that something was done. At the beginning of 1918 the eastern front gave way completely. By the peace of Brest-Litovsk (*q.v.*) with the Russian communists, and the peace of Bucharest with the Rumanians, Germany was free to concentrate all her forces on the west and to strike a decisive blow on that front before the arrival of the Americans. As in 1914 she almost succeeded, thanks to the superiority of her effectives and her unity of command. On March 21, 1918, in Picardy, on April 9 in Flanders, and on May 27 on the Aisne, the French and English fronts were overwhelmed and broken under an avalanche of poison-gas shells; the Germans advanced on Calais and Amiens, and pushed to within 65 kilometres of Paris, which they bombarded day and night by aeroplanes and by monstrous and mysterious guns. But unity of command grew out of the danger of disaster. Foch was opposed to Ludendorff. The campaign had now leadership and method; but the final battle was to last more than seven months.

Having been checked along the whole line after these passing successes, the Germans were once more defeated on the Marne (July 15–18). Foch in his turn took the offensive. Without giving the enemy time to breathe, he piled attack on attack, and forced him to retreat further every day in face of a combined attack of all the allied armies, till on Nov. 11 he drove him to capitulate in order to prevent total catastrophe. The armistice had been preceded and hastened by the collapse of Turkey and Bulgaria, and then by the overthrow of the Austro-Hungarian monarchy. Revolution broke out in Berlin and Munich, and William II., followed by the crown prince, fled to Holland. French troops re-entered Alsace-Lorraine, and there received, after half a century's absence, an unforgettable reception. Sedan was avenged. Victory was achieved, but Europe was in ruins.

AFTER THE WAR

The Conference of Paris.—A people battered in a four and a half years' struggle was swept by a wave of optimism. Peace seemed a happy and easy thing. But how different was the reality! The allies had no more foreseen the peace than they had anticipated the war. The French programme consisted of a vague formula of "restitution, reparation, guarantee." The Fourteen Points (*q.v.*) put forward by President Wilson were no less vague and were complicated into the bargain. As soon as their common danger was over the Allies returned to a consideration of their national interests; the English were pre-occupied with the sea, the French with their security on the Continent. And so amid the conflict of interests and traditions, the Conference of Paris elaborated a series of treaties which swept away the old Europe. (See PARIS, CONFERENCE OF, and VERSAILLES, TREATY OF.)

Germany was required to restore Alsace-Lorraine to France, and to repair the immense and systematic ruins she had made. As security for the undetermined milliards of these reparations the left bank of the Rhine was to be occupied by the western States until the day when Germany, having reduced her armaments as directed, should be admitted into the League of Nations, President Wilson's new Holy Alliance. Such were, in its main outlines, the terms of the peace signed on June 29, 1919, in the same Hall of Mirrors at Versailles as had seen the proclamation of the German empire on Jan. 18, 1871. The Treaties of St. Germain, Neuilly and the Trianon (*qq.v.*) settled the fate of what was left of Austria, Bulgaria and Hungary. Turkey refused the terms of the Treaty of Sévres (*q.v.*).

And so a multiple peace grew out of a multiple war. It was a mixture of many principles, including those of the balance of power and of nationality, and it left many problems unsettled for

the future. It was not a permanent solution, but only one stage of development. The feeling soon arose that the fatality of French history would reappear; that France once more would be forced to pick her difficult way between an England whose sole pre-occupation was the balance of power on the continent now that her sea power was secure; and a Germany who soon protested against the Treaty of Versailles and whose nature had not changed with her government.

The National Party.—The first essential was to restore to the country its normal political and economic life. Universal suffrage had not been consulted since 1914; the mandate of the existing chamber had expired. The elections of Nov. 1919 were conducted on a basis of proportional representation, and were, moreover, fought on a programme of national republican union and the natural Rhine frontier. The parties of the Left paid for their compromising attitude during the war; the Bolshevik menace, which had spread from Russia to Germany, secured the victory to the moderates of the *Bloc National*; the Radicals lost half their seats. But Clemenceau in turn was the victim of the disillusionment caused by the peace: he belonged to the past. Deschanel was chosen president of the Republic when Poincaré's term of office expired, for he seemed to be the one man capable of presiding over the organization of peace and the future destiny of the country. For France, terribly wounded, though victorious, the first consideration, as in 1871, was a programme of national reconstruction.

The Millerand Ministry.—The new year opened with a series of strikes, followed by the unhappy Caillaux (*q.v.*) case. For the first six months of 1920, Millerand, recalled from Alsace to form a ministry, set himself to restore order in the city: order in the streets against the General Confederation of Labour (C.G.T.), order in the public services, which were claiming the right of association and the right to strike, order in the finances by the vote of eight milliards of new taxes. Above all, he strove to extract the best he could from this "treaty, heavy rather with promises than realities." The Allies did not follow him in the interpretation which he put upon it. The American senate threw Wilson over and finally refused to ratify the Treaty of Versailles, preferring to conclude a separate peace with Germany. The British Cabinet desired to show Germany, a ruined and disarmed enemy, the same leniency which, in 1815, she had shown to France. To lose the fruits of victory or to break the *entente*—such were the horns of the dilemma upon which Millerand found himself, as had Clemenceau before him from the end of 1917 to the armistice. Every attempt to find a favourable solution, every conference, resulted in the repudiation of some part of the debt to France on the part of Germany; for she was astute enough to profit by Allied dissension. The Treaty of Versailles became a "*peau de chagrin*."

When allied financial solidarity had been broken, recriminations were made against the falling exchange and the insufficiency of taxation in exhausted France. When the working classes replied to the military *coup d'état* at Berlin with a general strike, and the *Reichswehr* entered the Ruhr basin in order to put it down, none of the Allies thought fit to join in Millerand's counter-action consisting of the occupation of Frankfurt (April–Aug.). When the Red armies, in April 1920, were threatening Poland, the England of Lloyd George and the United States of Wilson refused to intervene. It was Weygand's army which saved Warsaw, just as it was Gouraud's which enforced the French mandate in Syria. After the sudden appearance of danger in Poland, the successful action of Millerand resulted in his election to the presidency of the Republic, vacant through the illness of Deschanel (Sept.).

Leygues and Briand.—Millerand wished to emulate the president of the United States, who, not content to be a figure-head, actually governed. He claimed to exercise a kind of higher control over the direction of affairs, and hinted at a change in the constitution of 1875 in this sense. His authority, and the cleverness of Leygues, his president of the council, were necessary to bring to an end numerous difficulties in the grave territorial questions dealing with Upper Silesia, the reunion of Austria to Germany, and the question of disarmament. In the same way his direction

was essential in all the incidents arising out of the settlement of reparations, the number of which was increased by the deliberations of experts, by conferences of Allied ministers, and by the supreme council. After he had re-established a French embassy to the Vatican in the face of Radical and Socialist opposition led by Herriot and Paul Boncour, Leygues fell from power in a new Chamber as a result of the grave deficit in the revenue (Jan. 1921).

Briand, his successor, declared that he would not allow himself to be taken in by "the last struggles of German trickery," that France was tired of going from conference to conference—from deception to deception, and even threatened to seize guarantees. He allowed himself, however, to be drawn into making more and more concessions to the changeable opinions of Lloyd George. The Conference of Cannes followed the CONFERENCE OF LONDON (*q.v.*): (Great Britain), Upper Silesia, the Ruhr, Constantinople, Angora, Feisal, Poland and Russia—all these were questions requiring a settlement. It was claimed that some kind of compromise could be made between the victors and the vanquished by the admission of Germany to the deliberations; and Soviet Russia was to be asked to attend a future conference at Geneva. The chambers and public opinion protested, and Millerand recalled Briand, and asked for his resignation, although he had not been defeated in parliament (Jan. 1922).

Poincaré's Ministry.—Poincaré, hostile to all concessions to Germany, while she refused either to disarm or to pay, was chosen to reform French policy. His policy was founded on respect for treaties and social order; in his opinion the Treaty of Versailles, although he might have wished it different, was inviolable and he demanded that it should be exactly carried out. After the Genoa conference (*q.v.*) which, thanks to the Russo-German treaty of Rapallo (*q.v.*) was nothing but another Day of Dupes, after so many experiments which had done nothing but reduce German indebtedness, only one policy, he considered, was left—the policy of safeguards. No further reduction of Germany's debt was to be allowed unless the former allies accepted the cancellation of Allied debts, of which they had just demanded payment.

At the end of June Poincaré was victorious in the chamber in spite of an *entente cordiale* between communists, socialists and radical-socialists preparatory to the elections of 1924, and in spite of England. And so when the repeated and deliberate evasions of her engagements by Germany had been attested under the Treaty of Versailles by the Reparations Commission, Franco-Belgian troops occupied Essen (Jan. 11, 1923), and France declared that she would not evacuate either the Ruhr or the left bank of the Rhine so long as Germany refused to fulfil her engagements. The likelihood was that foreign pressure or a change of feeling at home would weaken this resolution. True to her traditional policy, England several times proposed mediation. France declined, maintaining that she claimed nothing but her due and was not seeking the hegemony of Europe. She refused to allow the war debts of Germany to be put on the same footing as the inter-Allied debts, contracted for the common purpose of winning the war, or to admit a prior claim to the recovery of these inter-Allied debts before the payment of reparations. Hence, faced by the inevitable ruin of German finance and the danger of the collapse of the *Reich*, Stresemann yielded (Sept. 24).

This was the moment chosen by the congress of French Radical-Socialists to begin an intensive campaign against the *Bloc National*, in reply to a speech of President Millerand at Evreux, wherein he had restated the vital necessity of unity, if victory was to be achieved. Already many radicals, especially in the south, had joined the socialists in forming the *cartel* of the Left, with the object of defeating Poincaré in the elections of May 1924. In the meanwhile, the signing (Sept. 23) of an agreement between the representatives of the great industries of the Ruhr and the Franco-Belgian authorities, was both a fresh proof of victory and a proposal for peace. But the advent of a labour Government in England stiffened German resistance.

Financial Policy.—The reparations on which France had reckoned had not been paid, and it was doubtful whether they

ever would be; hence she was obliged to rebuild the ruins by her own efforts. The work, far from being finished, had already used up considerable capital which, joined to the enormous war debts and aggravated by paper currency, had attained fabulous figures. Grave financial difficulties soon became a political danger, as the *ancien régime* and the revolution had shown. Very heavy taxation provoked resistance and encouraged demagoguery. The too easy expedient of paper currency precipitated the crash. The foreign policy of Poincaré was only vulnerable at two points: the stability of the franc and the high cost of living. In order to combat an international attack on the franc, economies and taxes such as had been too much neglected during the war, were now necessary, and this was a difficult policy for an election programme. On ground so favourable to its electoral hopes the opposition confronted the Government with obstruction both in and out of parliament, and the Government, as had happened in other war-stricken European countries, reinforced its power and substituted a regime of law by decree for the rules of ordinary parliamentary practice (Feb. 1924). The vote of the *double décime* was a financial Verdun. In ten days the franc rose from 120 to 80. In April, allied unity was reconstructed on the solid basis of the Dawes plan (*see* REPARATIONS and DAWES PLAN), which set up over Germany a tutelary council invested with very extensive powers.

After the battle of the franc, the electoral battle had to be won. Poincaré lost it on May 11, 1924. It was the result of a movement towards the Left at the very moment when the German elections of May 4 strengthened the parties of the extreme Right and the extreme Left. This was not entirely the fault of an electoral law mutilated by Radical amendments; the action of the Government had been weak and vacillating in home politics; neither patriotism nor republicanism was sufficient in itself, and the suffering country listened more readily to those who promised it peace and an end of its difficulties. The cartel of the Left began with a parliamentary *coup d'état*: the forced resignation of the president of the Republic, for Millerand was sacrificed to the hatred of the radicals and the socialists (July 1924). They had never forgiven him for the *Bloc National* of 1919, for his assumption of increased powers, nor, above all, for the speech at Evreux. However, instead of Millerand, and against Painlevé, the candidate of the cartel, Doumergue was elected by a large majority. The candidate of the Left for the presidency of the senate, Bienvenu-Martin, was also rejected—a double warning on the part of the senate to the party which for the time possessed the majority in the chamber.

The Herriot Ministry.—The Herriot ministry brought once more to the fore the old Radical programme; anti-clericalism extending to Alsace-Lorraine, the withdrawal of the embassy to the Vatican and the income-tax, together with Socialist demands: the right of trade unionism for State employees, the capital levy and the reduction of military service. The socialists, thanks to their "policy of support," shared in the benefits of office without its responsibilities. The new government had to face great financial difficulties. From 1924–26 there were no less than seven ministers of finance.

The encashment of bonds, the depletion of bank balances, the flight of capital, the fall of the franc, followed in quick succession. The ministry's record was no better in foreign policy. Having given up the guarantee of the Ruhr in Aug. 1924 at the Conference of London (*q.v.*), it did indeed at Geneva, by its valuable initiative, secure the triumph of the principle of arbitration. But the refusal of the British House of Commons to ratify "the protocol" and the German elections of Dec. 7, crowned on April 26 by the election of Hindenburg as president of the *Reich*, were not balanced by the resumption of relations with Bolshevik Russia.

The ministry of Herriot fell on April 11, 1925, when it was discovered that the Government had borrowed from the Banque de France a great deal more than it was legally allowed to borrow, and had secretly inflated the currency. On April 11 the order of the day in the senate demanded the re-establishment, "by the union of republicans, of internal peace and national concord."

The Painlevé Ministry.—The Painlevé-Caillaux-Briand ministry came into office after the socialists had once more refused the responsibilities of government through fear of their supporters joining the Communists. While proclaiming itself a loyal adherent of the radical policy, it had to make concessions to the senate on the subjects of military reform, the capital levy, the embassy to the Vatican and the Alsatian Concordat. Its first consideration was the development of the Protocol of Geneva and financial stability. Although its make-up was Cartellist, its policy was quite different.

The Locarno Conference.—The Painlevé ministry adopted a policy of relative conciliation. At Locarno (Oct. 16, 1925) Briand renounced the spirit, though not the letter, of the Treaty of Versailles, and patched up the *entente* between France and England. At the same time he opened the way to *rapprochement* with Germany, provided that she remained faithful to her treaties. It was the first step towards a federation of Europe. At home, the Government weakly took part in the Radical and Radical-Socialist conference at Nice, at the moment when, amidst the financial distress, the rising of Abd-el-Krim in Morocco, and of the Druses in Syria made it necessary to incur unforeseen expenses. At Nice the suggestion was made that a new Cartel should be formed—a consummation which the Socialists no longer desired. The first victim was Caillaux: rehabilitated on the strength of his financial reputation, he fell because in his financial projects he sinned against radical doctrine; the Painlevé cabinet patched up after his fall (Nov. 22, 1925), fell itself shortly afterwards, on a proposal to stop the payment of French Government Treasury Bonds.

After Herriot an inflation of five milliards had to be voted; after Painlevé seven and a half milliards. In addition to the double *décime* which the Cartel was to suppress, a quintuple *décime* was raised. Meanwhile the cost of living rose higher and higher. In Alsace and Lorraine there arose a movement in favour of autonomy. Briand could not decide between two possible majorities; concerned with conciliating the Left, he did all in his power to conciliate the Socialist group. On the other hand, Doumer, his finance minister, broke with the formula of the Cartel and followed an anti-socialist fiscal policy. On March 6, 1926 the ministry fell, being deserted by the Left and the Right.

The Geneva Ministry.—On March 10, 1926 Briand patched up the "Geneva" ministry, since it was impossible to keep waiting 45 nations assembled to decide upon the admission of Germany to the League of Nations. The same ministers, therefore, re-appeared, but with a third and different finance minister, Peret. But Malvy's inclusion as minister of the interior did not help in the formation of a new majority, a task rendered yet more difficult by by-elections in Paris, in which appeared a new Cartel, including the Communists, and by the speech of Herriot at Châteauroux.

In spite of fresh taxation, the balancing of the budget was as precarious as ever, the problem of stabilization had not yet been faced, and the question of debts owed to the Anglo-Saxon countries, in spite of Caillaux's efforts at London and Washington, followed by those of Berenger, had not reached a satisfactory settlement. This was slight material upon which to resume the "battle of the franc," which was beginning again as in 1924. On May 20 it had fallen to 170 to the pound sterling. The expedient of throwing in the Morgan funds as *masse de manoeuvre* failed. The struggle was still political rather than financial; the refusal of the Banque de France to pledge its gold reserve without political union in face of the common danger, brought about the fall of the second Briand ministry (June 15, 1926).

On June 23 Briand returned to power, this time with Caillaux as financial dictator, in order to rectify the finances. An isolated interpellation by Herriot, the president of the chamber, and one by L. Marin, president of the Republic-Democratic Union overthrew it over the question of the full powers claimed by Caillaux, the financial dictator.

The Ministry of National Union.—The announcement of a possible return of Herriot to power produced a general panic: the franc fell to 240. The State had only 60 millions in the

treasury. The bankruptcy of the Cartel restored Poincaré. A ministry of National Union was composed of the leaders of the chief groups in both chambers. It needed the evidence of danger, and the authority of Poincaré to effect a truce between the two opposing parties in order to save the national finances, and with them the system of government.

The opposition recruited from Cachin's Communists, Blum's Socialists, and the extreme Left Radical-Socialist group led by Caillaux, was more or less resigned to allowing "the Poincaré experiment" to have its way, in the secret hope of seeing it fail, or of profiting, as in 1924, by the unpopularity of fresh taxation and a new economic crisis. At the re-election of the third of the Senate in Jan. 1927, the party forces remained unchanged, despite the small schism of the Radical-Nationalists of Franklin-Bouillon. Nevertheless, Poincaré was, at last, able to carry out a logical programme, proceeding from the simple to the composite, and resolved to awaken general confidence in the country and among its allies.

Foreign Policy.—Two years of the Cartel had led foreign States to believe that the Government of the Republic was prepared to yield on all hands. Germany, after her admission to the League of Nations in Sept. 1926, and the meeting at Thoiry, (Italy) under the expansionist sway of Mussolini, and even Spain, under Primo de Rivera, with a view to Tangiers, had not resisted the temptation to exploit the weakness of France. With regard to Germany, Poincaré declared himself ready to adopt a policy of *rapprochement* without sacrificing French contractual rights, and without withdrawing from an attitude of watchfulness or allowing any doubt to arise as to the responsibility for the war. The reparations question had been settled by the Dawes scheme. He therefore settled the question of disarmament by supporting the suppression of the inter-allied mission of military control on Jan. 21, 1927, and then signed a Franco-German treaty of commerce on Aug. 17. But he refused the desired evacuation of the Rhineland and a proposal for a revision of the Dawes scheme.

The visit of the president to London in May was a solemn affirmation of the *entente* with regard not only to the questions of eastern Europe but to the world-wide problems entailed by Bolshevik propaganda. Poincaré also helped to strengthen the Little Entente (*q.v.*) against all attempts to call in question the settlement of territories in the Balkans. Having learnt by experience in 1925 at Washington, he refused to play what he considered the part of dupe at the naval conference at Geneva, for in his eyes disarmament was of necessity dependent on security.

Financial Reconstruction.—Thanks to this stability, long a stranger in home politics, financial recovery was carried through by regular steps. The budget was balanced by means of nine milliards of new taxation, and voted twice before Jan. 1, 1927. The floating debt was gradually consolidated and the value of money, pending its legal stabilization, stabilized *de facto*. Hence France gradually settled down on a firm economic basis, and progressed along the path of financial reconstruction. The final step was taken in 1928 by the re-establishment of the gold standard at about one-fifth of pre-war parity. (P. W.)

1928-29.—In Jan. 1928 the chamber decided to cut the period for compulsory military service from 18 months to 12 months. In February an arbitration treaty was signed between France and the United States. In April the general election showed a decisive victory for the Poincaré ministry. The earlier part of the year was as a whole disturbed by the autonomist agitation in Alsace-Lorraine (*q.v.*) and by the subsequent arrest and trials of the leaders of that party. For some time the question of a pact for the "outlawry of war" (*q.v.*) had been under negotiation between the United States and France; it was brought to a successful conclusion when on Aug. 27 the "Kellogg Pact" was signed at Paris by 15 nations. Although of no greater binding force than any other treaty it was rightly regarded throughout the world as a deliberate step in the direction of disarmament. Shortly afterwards some apprehension was caused by the premature revelation in the Press (Oct. 5) of the Anglo-French Naval Compromise.

France was still opposed to any change of policy of the Rhineland (*q.v.*), but early in September the question of evacuation at least received particular discussion between Briand and Herr Müller at Geneva. On Nov. 7, the Poincaré Cabinet resigned as a consequence of a clause in the manifesto passed by the Socialist-Radical Congress at Angers which obliged four ministers, members of that party, to withdraw from the Government. Poincaré, however, was able immediately to reform his cabinet, and his ministry received a substantial vote of confidence, which again was repeated during the early part of 1929.

In commemoration of the five hundredth anniversary of Joan of Arc's mission a memorial tablet was placed in each of the numerous villages through which the Maid passed, the first being erected at Vaucouleurs on Feb. 22. The Kellogg-Briand Peace Pact was ratified in March by overwhelming majorities in both houses. On March 27 the Parliament voted measures for authorizing the religious missionary orders to train recruits in France. The municipal elections held in May resulted in but few changes in political alignment.

With the assembling of Parliament on May 23 began a strenuous debate on the question of the Mellon-Berenger debt settlement with the United States and also the Caillaux-Churchill arrangement for the payment of British debts. After a period of grave uncertainty, both debt settlements were finally ratified, largely through the efforts of Poincaré, who thereupon (July 26) resigned the premiership because of ill health. Briand, who became premier on July 27, went on with the Cabinet unchanged save for the absence of Poincaré.

At The Hague Conference in August, attended by Briand, the French policies encountered opposition, and in the election of Oct. 20 the results were somewhat unfavourable to the Briand ministry. Despite Briand's desire that it might continue in power until he had completed the task of establishing the Young Plan (*see* REPARATIONS), a combination of Right and Left votes on Oct. 22 overthrew his ministry. After futile attempts by Daladier and Clementel to form a Cabinet, Tardieu on Nov. 1 organized a new ministry, very similar to that headed by Poincaré, with Briand again minister for foreign affairs. The new Cabinet successfully met its first test on matters of policy on Nov. 9. On Nov. 30 the evacuation of the second zone of occupation on the Rhine, provided for in the Versailles treaty, was completed by the withdrawal of the French troops from Coblenz.

During 1929, as in 1928, France enjoyed signal prosperity, with practically no unemployment. (*See* also SECURITY; EUROPE; RHINELAND; RUHR.)

BIBLIOGRAPHY AND HISTORIOGRAPHY

The scientific study of the history of France only begins with the 16th century. It was hampered at first by the traditions of the middle ages and by a servile imitation of antiquity. Moreover, as yet, historical research lacked method, leaders and trained workers; it found them all in the 17th century, the golden age of learning which was honoured alike by laymen, priests and members of the monastic orders, especially the Benedictines of the congregation of St. Maur. The publication of original documents was carried on with enthusiasm. To André Duchesne we owe two great collections of chronicles: the *Historiae Normannorum scriptores antiqui* (1619) and the *Historiae Francorum scriptores*, continued by his son François (1636-49). The clergy were very much aided in their work by their private libraries and by their co-operation; Père Philippe Labbe published his *Bibliotheca nova manuscriptorum* (1657), and began (1671) his *Collection des conciles*, which was successfully completed by his colleague Père Cossart (18 vols.). In 1643 the Jesuit Jean Bolland brought out vol. i. of the *Acta sanctorum*, a vast collection of stories and legends which has not yet been completed beyond Nov. 10 (*see* BOLLANDISTS). The Benedictines, for their part, published the *Acta sanctorum ordinis sancti Benedicti* (9 vols., 1668-1701). One of the chief editors of this collection, Dom Jean Mabillon, published on his own account the *Vetera analecta* (4 vols., 1675-85) and prepared the *Annales ordinis sancti Benedicti* (6 vols., 1703-93). To Dom Thierry Ruinart we owe good editions of Gregory of Tours and Fredegarius (1699). The learning of the 17th century further inaugurated those specialized studies which are important aids to history. Mabillon in his *De re diplomatica* (1681) creates the science of documents or diplomatics. Adrien de Valois lays a sound foundation for historical geography by his critical edition of the *Notitia Galliarum* (1675). Numismatics finds an enlightened pioneer in François Leblanc (*Traité historique des monnaies de France*, 1690). Du Cange, one of the greatest of the French scholars who have studied

the middle ages, has defined terms bearing on institutions in his *Glossarium mediae et infimae latinitatis* (1678), recast by the Benedictines (1733), with an important supplement by Dom Carpentier (1768), republished twice during the 19th century, with additions, by F. Didot (1840-50), and by L. Favre at Niort (1883-88); this work is still indispensable to every student of mediaeval history. Finally, great biographical or bibliographical works were undertaken; the *Gallia christiana*, which gave a chronological list of the archbishops, bishops and abbots of the Gauls and of France, was compiled by two twin brothers, Scévole and Louis de Sainte-Marthe, and by the two sons of Louis (4 vols., 1656); a fresh edition, on a better plan, and with great additions, was begun in 1715 by Denys de Sainte-Marthe, continued throughout the 18th century by the Benedictines, and finished in the 19th century by J. Barthélemy Hauréau (1856-61).

As to the nobility, a series of researches and publications, begun by Pierre d'Hozier (d. 1660) and continued well on into the 19th century by several of his descendants, developed into the *Armorial général de la France*, which was remodelled several times; extracts are often reprinted, the last volume to date being published in 1905. A similar work, of a more critical nature, was carried out by Père Anselme (*Histoire généalogique de la maison de France et des grands officiers de la couronne*, 1674) and by Père Ange and Père Simplicien, who completed the work (3rd ed., 9 vols., 1726-33). Critical bibliography is especially represented by certain Protestants, expelled from France by the revocation of the Edict of Nantes. Pierre Bayle, the sceptic, famous for his *Dictionnaire critique* (1699), which is in part a refutation of the *Dictionnaire historique et géographique* published in 1673 by the Abbé Louis Moréri, was the first to publish the *Nouvelles de la république des lettres* (1684-87), which was continued by Henri Basnage de Beauval under the title of *Histoire des ouvrages des savants* (24 vols.). In imitation of this, Jean Le Clerc successively edited a *Bibliothèque universelle et historique* (1686-93), a *Bibliothèque choisie* (1703-13), and a *Bibliothèque ancienne et moderne* (1714-27). These were the first of our "periodicals."

The 18th century continues the traditions of the 17th. The Benedictines still for some time hold the first place. Dom Edmond Martène visited numerous archives (which were then closed) in France and neighbouring countries, and drew from them the material for two important collections: *Thesaurus novus anecdotorum* (9 vols., 1717, in collaboration with Dom Ursin Durand) and *Veterum scriptorum collectio* (9 vols., 1724-33). Dom Bernard de Montfaucon also travelled in search of illustrated records of antiquity; private collections, among others the celebrated collection of Gaignières (now in the Bibliothèque Nationale), provided him with the illustrations which he published in his *Monuments de la monarchie française* (5 vols., 1709-33). The text is in Latin and French. Dom Martin Bouquet took up the work begun by the two Duchesnes, and in 1738 published vol. i. of the *Historians of France (Rerum Gallicarum et Francicarum scriptores)*, an enormous collection which was intended to include all the sources of the history of France, grouped under centuries and reigns. He produced the first eight volumes himself; his work was continued by several collaborators, the most active of whom was Dom Michel J. Brial, and already comprised 13 volumes when it was interrupted by the Revolution. In 1733, Antoine Rivet de La Grange produced vol. i. of the *Histoire littéraire de la France*, which in 1789 numbered 12 volumes. While Dom C. François Toussaint and Dom René Prosper Tassin published a *Nouveau Traité de diplomatique* (6 vols., 1750-65), others were undertaking the *Art de vérifier les dates* (1750; new and much enlarged edition in 1770). Still others, with more or less success, attempted histories of the provinces.

In the second half of the 18th century, the ardour of the Benedictines of St. Maur diminished, and scientific work passed more and more into the hands of laymen. The Académie des Inscriptions et Belles-lettres, founded in 1663 and reorganized in 1701, became its chief instrument, numbering among its members Denis François Secousse, who continued the collection of *Ordonnances des rois de France*, begun (1723) by J. de Laurière; J.-B. de La Curne de Sainte Palaye (*Mémoires sur l'ancienne chevalerie*, 1759-81; *Glossaire de la langue française depuis son origine jusqu'à la fin de Louis XIV.*, printed only in 1875-82); J.-B. d'Anville (*Notice sur l'ancienne Gaule tirée des monuments*, 1760); and L. G. de Bréquigny, the greatest of them all, who continued the publication of the *Ordonnances*, began the *Table chronologique des diplômes concernant l'histoire de France* (3 vols., 1769-83), published the *Diplomata, chartae, ad res Francicas spectantia* (1791, with the collaboration of La Porte du Theil), and directed fruitful researches in the archives in London to enrich the *Cabinet des chartes*, where Henri Bertin (1719-92), an enlightened minister of Louis XV., had in 1764 set himself the task of collecting the documentary sources of the national history. The example set by the religious orders and the government bore fruit. The general assembly of the clergy gave orders that its *Procès verbaux* (9 vols., 1767-89) should be printed; some of the provinces decided to have their history written, and mostly applied to the Benedictines; Brittany was treated by Dom Lobineau (1707) and Dom Morice (1742); the duchy of Burgundy by Dom Urbain Plancher (1739-48); Languedoc by Dom Dominique Vaissete (1730-49, in collaboration with Dom Claude de Vic; new ed. 1873-93); for Paris, its secular history was treated by Dom Michel Félibien and Dom Lobineau (1725), and its ecclesiastical by the abbé Lebeuf (1745-60; new ed. 1883-90).

This ever-increasing stream of new evidence aroused curiosity, gave rise to pregnant comparisons, developed and sharpened the critical sense, but further led to a more and more urgent need for exact information. The Académie des Inscriptions brought out its *Histoire de l'Académie avec les mémoires de littérature tirés de ses registres* (vol. i. 1717; 51 vols. appeared before the Revolution, with five indexes; see the *Bibliographie* of Lasteyrie, vol. iii. pp. 256 et seq.). Other collections, mostly of the nature of bibliographies, were the *Journal des savants* (111 vols., from 1665 to 1792; see the *Table méthodique* by H. Cocheris, 1860); the *Journal de Trévoux*, or *Mémoires pour l'histoire des sciences et des beaux-arts*, edited by Jesuits (265 vols., 1701-90); the *Mercur de France* (977 vols., 1724-91). To these must be added the dictionaries and encyclopaedias: the *Dictionnaire de Moréri*, the last edition of which numbers 10 vols. (1759); the *Dictionnaire géographique, historique et politique des Gaules et de la France*, by the abbé J. J. Expilly (6 vols., 1762-70; unfinished); the *Répertoire universel et raisonné de jurisprudence civile, criminelle, canonique et bénéficiale*, by Guyot (64 vols., 1775-86; supplement in 17 vols., 1784-85), reorganized and continued by Merlin de Douai, who was afterwards one of the *Montagnards*, a member of the Directory, and a count under the Empire.

The historians did not use to the greatest advantage the treasures of learning provided for them; they were for the most part superficial, and dominated by their political or religious prejudices. Thus works like that of Père Gabriel Daniel (*Histoire de France*, 3 vols., 1713), of Président Hénault (*Abrégé chronologique*, 1744; 25 editions between 1770 and 1834), of the abbé Paul François Velly and those who completed his work (*Histoire de France*, 33 vols., 1765-83), of G. H. Gaillard (*Histoire de la rivalité de la France et de l'Angleterre*, 11 vols., 1771-77), and of L. P. Anquetil (1805), in spite of the brilliant success with which they met at first, have fallen into a just oblivion. A separate place must be given to the works of the theorists and philosophers: *Histoire de l'ancien gouvernement de la France*, by the Comte de Boulainvilliers (1727), *Histoire critique de l'établissement de la monarchie française dans les deux Gaules*, by the abbé J. B. Dubos (1734); *L'Esprit des lois*, by the président de Montesquieu (1748); the *Observations sur l'histoire de France*, by the abbé de Mably (1765); the *Théorie de la politique de la monarchie française*, by Marie Pauline de Lézardière (1792). These works have, if nothing else, the merit of provoking reflection.

At the time of the Revolution this activity was checked. The religious communities and royal academies were suppressed, and France violently broke with even her most recent past, which was considered to belong to the *ancien régime*. When peace was re-established, she began the task of making good the damage which had been done, but a greater effort was now necessary in order to revive the spirit of the institutions which had been overthrown. The new State, which was, in spite of all, bound by so many ties to the former order of things, seconded this effort, and during the whole of the 19th century, and even longer, had a strong influence on historical production. The section of the Institut de France, which in 1816 assumed the old name of Académie des Inscriptions et Belles-lettres, began to reissue the two series of the *Mémoires* and of the *Notices et extraits des manuscrits tirés de la bibliothèque royale* (the first volume had appeared in 1787); began (1844) that of the *Mémoires présentés par divers savants* and the *Comptes rendus* (subject index 1857-1900, by G. Ledos, 1906); and continued the *Recueil des historiens de France*, the plan of which was enlarged by degrees (*Historiens des croisades, obituaires, pouillés, comptes, etc.*), the *Ordonnances* and the *Table chronologique des diplômes*. During the reign of Louis Philippe, the ministry of the interior reorganized the administration of the archives of the departments, communes and hospitals, of which the *Inventaires sommaires* are a mine of precious information (see the *Rapport au ministre*, by G. Servois, 1902). In 1834 the ministry of public instruction founded a committee, which has been called since 1881 the "Comité des Travaux historiques et scientifiques," under the direction of which have been published: (1) the *Collection des documents inédits sur l'histoire de France* (since 1835); (2) the *Catalogue général des manuscrits des bibliothèques de France*; (3) the *Dictionnaires topographiques*; and the *Répertoires archéologiques* of the French departments (1861, etc.); (4) several series of *Bulletins*, the details of which will be found in the *Bibliographie* of R. Lasteyrie. At the same time were founded or reorganized, both in Paris and the departments, numerous societies, devoted sometimes partially and sometimes exclusively to history and archaeology; the Académie Celtique (1804), which in 1813 became the Société des Antiquaires de France (general index by M. Prou, 1894); the Société de l'Histoire de France (1834); the Société de l'École des Chartes (1839); the Société de l'Histoire de Paris et de l'Île-de-France (1874; four decennial indexes), etc. The details will be found in the excellent *Bibliographie générale des travaux historiques et archéologiques publiés par les sociétés savantes de France*, which appeared 1885-1911, under the direction of Robert de Lasteyrie and others. See also the *Bibliographie annuelle des travaux historiques* (1906, etc.).

Individual scholars also associated themselves with this great literary movement. F. P. J. Guizot published a *Collection de mémoires relatifs à l'histoire de France* (31 vols., 1824-35); J. A. C. Buchon, a *Collection des chroniques nationales françaises écrites en langue vulgaire du XIII^e au XVI^e siècle* (47 vols., 1824-29), and a *Choix de chroniques et mémoires sur l'histoire de France* (14 vols., 1836-41); A. Petitot and

L. J. N. Monmerqué, a *Collection de mémoires relatifs à l'histoire de France* (131 vols., 1819-29); J. F. Michaud and J. J. F. Poujoulat, a *Nouvelle Collection de mémoires pour servir à l'histoire de France* (32 vols., 1836-39); J. F. Barrière and M. F. A. de Lescure, a *Bibliothèque de mémoires relatifs à l'histoire de France pendant le XVIII^e siècle* (30 vols., 1855-75); and finally Sr. A. Berville and J. F. Barrière, a *Collection des mémoires relatifs à la Révolution Française* (55 vols., 1820-27). The details are to be found in the *Sources de l'histoire de France*, by Alfred Franklin (1876). The abbé J. P. Migne in his *Patrologia Latina* (221 vols., 1844-64) re-edited a number of texts anterior to the 13th century. Under the Second Empire, the administration of the imperial archives at Paris published ten volumes of documents (*Monuments historiques*, 1866; *Layettes du trésor des chartes*, 1863, which were afterwards continued up to 1270; *Actes du parlement de Paris*, 1863-67), not to mention several volumes of *Inventaires*. The administration of the Bibliothèque impériale had printed the *Catalogue général de l'histoire de France* (10 vols., 1855-70; vol. xi., containing the alphabetical index to the names of the authors, appeared in 1895). Other countries also supplied a number of useful texts; there is much in the English Rolls series, in the collection of *Chroniques belges*, and especially in the *Monumenta Germaniae historica*.

At the same time the scope of history and its auxiliary sciences becomes more clearly defined; the École des Chartes produces some excellent palaeographers, as for instance Natalis de Wailly (*Éléments de paléographie*, 1838), and L. Delisle (*q.v.*), who has also left traces of his profound researches in the most varied departments of mediaeval history (*Bibliographie des travaux de M. Léopold Delisle*, 1902); Anatole de Barthélemy made a study of coins and medals, Douët d'Arco and G. Demay of seals. The works of Alexandre Lenoir (*Musée des monuments français*, 1800-22), of Arcisse de Caumont (*Histoire de l'architecture du moyen âge*, 1837; *Abécédaire ou rudiment d'archéologie*, 1850), of A. Napoléon Didron (*Annales archéologiques*, 1844), of Jules Quicherat (*Mélanges d'archéologie et d'histoire*, published after his death, 1886), and the dictionaries of E. E. Viollet le Duc (*Dictionnaire raisonné de l'architecture française*, 1853-68; *Dictionnaire du mobilier français*, 1855) displayed to the best advantage one of the most brilliant sides of the French intellect, while the other sciences, such as geology, anthropology, the comparative study of languages, religions and folk-lore, and political economy, continued to enlarge the horizon of history. The task of writing the general history of a country became more and more difficult, especially for one man, but the task was none the less undertaken by several historians, and by some of eminence. François Guizot treated of the *Histoire de la civilisation en France* (1828-30); Augustin Thierry after the *Récits des temps mérovingiens* (1840) published the *Monuments de l'histoire du tiers état* (1849-56), the introduction to which was expanded into a book (1855); Charles Simonde de Sismondi produced a mediocre *Histoire des français* in 31 vols. (1821-44), and Henri Martin a *Histoire de France* in 16 vols. (1847-54), now of small use except for the two or three last centuries of the *ancien régime*. Finally J. Richelet, in his *Histoire de France* (17 vols., 1833-56) and his *Histoire de la Révolution* (7 vols., 1847-53), aimed at reviving the very soul of the nation's past.

After the Franco-German War begins a better organization of scientific studies, modelled on that of Germany. The École des Hautes Études, established in 1868, included in its programme the critical study of the sources, both Latin and French, of the history of France, and from the *séminaire* of Gabriel Monod came men of learning, already prepared by study at the École des Chartes: Paul Viollet, who revived the study of the history of French law; Julien Havet, who revived that of Merovingian diplomatics; Arthur Giry, who, resuming the study of municipal institutions where it had been left by A. Thierry, prepared the *Annales carolingiennes* (written by his pupils, Eckel, Favre, Lauer, Lot, Poupardin), and brought back into honour the study of diplomatics (*Manuel de diplomatique*, 1894); Auguste Molinier, author of the *Sources de l'histoire de France* (1902-1904; general index, 1906), etc. Auguste Longnon introduced at the École des Hautes Études the study of historical geography (*Atlas historique de la France* [1885-89] [no more published]). The universities, at last reorganized, popularized the employment of the new methods. The books of Fustel de Coulanges and Achille Luchaire on the middle ages, and those of A. Aulard on the Revolution, gave a strong, though well-regulated, impetus to historical production. The École de Louvre (1881) increased the value of the museums and placed the history of art among the studies of higher education, while the Musée archéologique de St.-Germain-en-Laye offered a fruitful field for research on Gallic and Gallo-Roman antiquities. Rich archives, hitherto inaccessible, were thrown open to students; at Rome those of the Vatican (*Registres pontificaux*, published by students at the French school of archaeology, since 1884); at Paris, those of the Foreign Office (*Recueil des instructions données aux ambassadeurs depuis le traité de Westphalie*, 16 vols., 1885-1901; besides various collections of diplomatic papers, inventories, etc.). Those of the War Office were used by officers who published numerous documents bearing on the wars of the Revolution and the Empire, and on that of 1870-71. In 1904 a commission, generously endowed by the French parlement, was entrusted with the task of publishing documents relating to economic and social life of the time of the Revolution, and the work is still in progress. Certain towns,

Paris, Bordeaux, etc., have made it a point of honour to have their chief historical monuments printed. The work now becomes more and more specialized. *L'Histoire de France*, edited by Ernest Lavisse (1900-22), is the work of a number of authors. The *Manuel de bibliographie historique* of Ch. V. Langlois (2nd edition, 1901-04) is a good guide, as is his *Archives de l'histoire de France* (1891, in collaboration with H. Stein).

Besides the special bibliographies mentioned above, it will be useful to consult the *Bibliothèque historique* of Père Jacques Lelong (1719; new ed. by Fevret de Fontette, 5 vols., 1768-78); the *Geschichte der historischen Forschung und Kunst* of Ludwig Wachler (2 vols., 1812-1816); the *Bibliographie de la France*, established in 1811 (1st series, 1811-56, 45 vols., 2nd series, 1 vol. per annum since 1857 as *Journal général de l'imprimerie et de la Librairie*); the publications of the Société Bibliographique (*Polybiblion* from 1868); the *Bibliographie de l'histoire de France*, by Gabriel Monod (1888); the *Répertoire* of the abbé Ulysse Chevalier (*Biobibliographie*; new ed. 1903-07; and *Topobibliographie*, 1894-99). Bearing exclusively on the middle ages are the *Bibliotheca historica aevi* of August Potthast (new ed. 1896) and the *Manuel (Les Sources de l'histoire de France, 1901)* of A. Molinier; but the latter is to be continued up to modern times, by H. Hauser (since 1906), and is still in progress. Finally, various special reviews, besides teaching historical method by criticism and example, try to keep their readers au courant with literary production; the *Revue critique d'histoire et de littérature* and *Revue des questions historiques* (both since 1866), the *Revue historique* (since 1876), the *Revue d'histoire moderne et contemporaine*, accompanied annually by a valuable *Répertoire méthodique* (since 1898); the *Revue de synthèse historique* (since 1900); etc.

Since the above bibliography was compiled the following works have appeared: E. Bourgeois, *Manuel historique de la politique étrangère* (1892-1906); A. Gauvain, *L'Europe avant la guerre* (1917); and *L'Europe au jour le jour* (1917-23); A. Albert-Petit, *La France de la guerre* (3 vols. 1918-19); E. Lavisse, *Histoire de France contemporaine* (10 vols., 1920-22); J. Aulneau, *Le Rhin et la France* (1921); E. Bourgeois et G. Pagès, *Les origines et les responsabilités de la Grande Guerre* (1921); J. Caillaux, *Mes Prisons* (1921); A. Dumaine, *La Dernière Ambassade de France en Autriche* (1921); A. Breton, *Les Commissions et la réforme de la procédure parlementaire* (1922); R. H. Soltan, *French Parties and Politics* (World of To-day Series, 1922); J. Carrère and G. Bourgin, *Manuel des parties politiques en France* (1924); P. Renourier, *Les origines immédiates de la Guerre* (1925); Denis Gwynn, *The "Action Française" Condemnation* (1928). See also bibliography to article EUROPEAN WAR; also *Les Recueils diplomatiques*; and the Yellow, Blue, Red, Orange, Green and White Books, published by the Governments concerned since 1914.

FRANCESCHI, JEAN BAPTISTE, BARON (1766-1813), French general, was born at Bastia, Corsica, on Dec. 5, 1766, and entered the French service in 1793. He served in Italy from 1795 to 1799, again as a general officer in the campaign of Marengo, in the Naples campaign of 1805-06, and in the Peninsular War from 1807 to 1809. He commanded a Neapolitan brigade in the Russian war of 1812, and died at Danzig on March 19, 1813.

Two other generals of brigade in Napoleon's wars bore the name of Franceschi, and the three have often been mistaken for each other. JEAN BAPTISTE MARIE FRANCESCHI-DELONNE (1767-1810), who served throughout the revolutionary campaign on the Rhine, took part in the campaign of Zürich in 1799, and escaped from, and returned to, Genoa, when in 1800 Masséna was besieged there. In the Peninsular War he won distinction as a cavalry general. He died, a prisoner of the Spaniards, at Carthage on Oct. 23, 1810. FRANÇOIS FRANCESCHI-LOSTO (1770-1810), born at Milan, served through the Italian campaign of 1796-97, and subsequently, like Franceschi-Delonne, with Masséna at Zürich and at Genoa, and at the headquarters of King Joseph in Italy and Spain. He was killed in a duel by the Neapolitan colonel Filangieri in 1810.

FRANCESCHI, PIERO DE', called PIERO DELLA FRANCESCA (c. 1418-1492), Italian painter of the Umbrian school. He was born at Borgo San Sepolcro in Umbria. His father, a well-to-do cloth merchant, was married twice; and it is supposed that the second wife, Francesca Cenci of Arezzo, was Piero's mother—hence his name "della Francesca." From early youth he showed a bent for mathematical sciences. His first studies in art were probably made in his native town. He may have chosen Sassetta as his master, the naïve and graceful inheritor of the decorative aims of the early school of Siena, who was then employed on an altarpiece for San Francesco in Borgo. The earliest record of Piero (1439) describes him as assisting Domenico Veneziano in painting the choir of Sta. Maria Nuova in Florence. His stay in that city brought him into touch with a group of artists, who were absorbed

in problems of form and perspective, which naturally appealed to his mathematical mind. He was indeed able to carry investigations farther than Brunelleschi and Uccello, for he was a great mathematician and he applied his science to his art. Vasari, who speaks of him with admiration, does not fail to emphasize his twofold accomplishment, and calls him the greatest geometrician of his time. In his first extant work, an altarpiece which he was commissioned to paint in 1445 for the Compagnia della Misericordia of Borgo San Sepolcro (now in the Palazzo Comunale), his style is already fully developed. In 1451 he was at Rimini painting Sigismondo Malatesta kneeling before his patron saint, on a fresco in the church of San Francesco. According to Vasari he then worked in Pesaro and in Ancona. He was called to Ferrara by Duke Borso d'Este, and to Rome by Pope Nicholas V.; but the paintings then executed by him no longer exist. Between 1452 and 1466 he was at work on his great masterpiece, the series of frescoes illustrating the "History of the Cross" in the choir of S. Francesco in Arezzo. This legend gave scope to many picturesque and suggestive incidents. The planting of the tree on Adam's grave at the beginning of things; the recognition of its destiny by the queen of Sheba on her visit to King Solomon, the dream of Constantine in his tent; his victorious battle; the finding of the cross by St. Helena, and finally its recovery from the Persians, 300 years later, by the emperor Heraclius. Here Piero can be seen at the height of his powers. The scenes are scientifically composed arrangements. Art and geometry combined in the creation of a severe and monumental style. Natural form was simplified and translated into decorative design. Moreover, his art reveals an interest in effects of light and "plein air"; and in more than one respect tends towards naturalism, when compared with the art of his predecessors. About this time Piero painted the impressive "Resurrection" in the Palazzo Comunale in Borgo, mystic in conception, considered by Vasari to be his masterpiece. In the '60s, we find him employed on work for Federigo of Montefeltro, the art-loving and cultured duke of Urbino. He painted Federigo's portrait and that of his wife, Battista Sforza, two clear-cut profiles facing each other in a diptych (Uffizi, Florence); also the "Flagellation" in the cathedral of Urbino, and the altarpiece representing the duke kneeling before the Madonna surrounded by saints (Brera, Milan). At the end of his life Piero retired to his native town in Umbria and wrote two mathematical treatises, one on perspective, and another on the five regular solids, with the object of providing a guide and mathematical foundation for the coming generation of artists. Fra Luca Pacioli, the mathematician and friend of Leonardo da Vinci, was his compatriot and pupil. Indeed Vasari accused the friar of plagiarizing Piero's mathematical writings. According to Vasari, Piero became blind at the age of sixty. In his will, however, dated July 5, 1487 he is described as fit both in body and mind. He died in Oct. 1492 and was buried on the 12th of that month in the family tomb in the Badia of Borgo San Sepolcro.

He was one of the greatest personalities of the Quattrocento, exercising a widespread influence on the development of art. Luca Signorelli was his most distinguished pupil. Though Piero was for some time neglected and forgotten, he has of late come into his own again, for his art, which so happily combines the decorative element of two-dimensional design with the representation of three-dimensional space, seems to contain much that certain modernists are striving after. The following works, besides those mentioned above, are generally recognized as being by the master:—"St. Jerome with a man kneeling in a landscape" (Academy at Venice); an altarpiece representing the "Madonna and Saints" and the "Annunciation" (Pinacoteca at Perugia), "St. Thomas of Aquinas" (Poldi-Pezzoli collection at Milan) and St. Louis of Toulouse (Palazzo Comunale at Borgo). Only very few of his pictures have left Italy. The National Gallery, London, is the fortunate possessor of two of these:—"The Baptism of Christ," an early work, the "Nativity," a late work. In Mrs. Gardner's collection at Boston is a young Hercules, a fresco from a palace in Borgo San Sepolcro.

See Vasari, *Milanesi II.*; Crowe-Cavalcaselle, *III.* (ed. 1914); W. G. Waters, *Piero della Francesca* (2nd ed., 1901); C. Ricci, *P. della*

Francesca (1912); Evelyn, *P. della Francesca* (1912). Piero's theoretical writings:—*De prospectiva pingendi*; published by C. Winterberg (1899); manuscripts in the Royal library at Parma, in the Ambrosiana at Milan, in the Bibliothèque Nationale in Paris, and in the library at Bordeaux; *Libellus de V corporibus regularibus*, manuscript in the Vatican library. (I. A. R.)

FRANCESCHINI, BALDASSARE (1611–1689), Italian painter of the Tuscan school, named, from Volterra the place of his birth, Il Volterrano, was the son of a sculptor in alabaster. At a very early age he started as an assistant to his father and then studied under the Florentine painter Matteo Rosselli. From 1652–1660 he was employed on paintings in the cupola of the Niccolini chapel in S. Croce, Florence, which constitute his most noted performance. Among his best oil paintings of large scale is the "St. John the Evangelist" in the church of S. Chiara at Volterra. One of his latest works was the fresco of the cupola of the Annunziata, Florence, which occupied him for two years towards 1683. Franceschini died of apoplexy at Volterra on Jan. 6, 1689. He is not to be confounded with Marco Antonio Franceschini (1648–1729), who was a Bolognese, a pupil of Carlo Cignani and a famous painter in his time.

FRANCESCHINI, MARCO ANTONIO (1648–1729), Italian painter, born at Bologna on April 5, 1648. He studied under G. M. Galli Bibiena and Carlo Cignani, whose assistant and collaborator he was for some time in works at Bologna, Forlì, Piacenza, Modena and Reggio. He rose to be one of the most favoured artists of his time, his reputation spreading beyond his native town. He received commissions from churches and monasteries all over the country, from the duke of Parma, from the elector of the Palatinate, the prince of Liechtenstein and others. Pope Clement XI. made him a knight of the order of Christ in 1712 in recognition of his services after he had designed two cartoons for mosaics in St. Peter's. He was called to Genoa twice, in 1702 and in 1714; and there decorated the Council palace with frescoes, no longer extant, representing scenes from the history of the republic, and there also painted pictures for the palaces of Pallavicini and Fil. Durazzo and frescoes for the church of the Padri Filippini. His most famous work was done for the church of Corpus Domini at Bologna (1687–94), where with the assistance of Luigi Quaini and Enrico Haffner, he decorated the cupola and ceiling with frescoes and painted a number of altarpieces, the most notable being the one representing the "Death of St. Joseph." He was elected director of the Academia Clementina at Bologna. He died on Dec. 14, 1729. Franceschini was the last great representative of the Bolognese school. He possessed a refined sense of colour and a power of disposing pictorially over vast surfaces with great variety and freedom of composition, with effective grouping of figures graceful in movement with boldly foreshortened poses. However, his style was somewhat superficial and not free from mannerism.

See G. P. Zanotti, *Storia dell' Accademia Clementina* (1745).

FRANCHE-COMTÉ, a province of France from 1674 to the Revolution. It was bounded on the east by Switzerland, on the south by Bresse and Bugey, on the north by Lorraine, and on the west by the duchy of Burgundy and by Bassigny, embracing to the east of the Jura the valley of the Saône and most of that of the Doubs. Under the Romans it corresponded to *Maxima Sequanorum*, and after having formed part of the kingdom of Burgundy was in the early part of the middle ages split up into the four countships of Porto, Varais, Amons and Escuens. In the 10th century these were united to form a whole, which came to be called the countship of Burgundy, and belonged at that time to the counts of Mâcon.

The limits of the countship were definitely settled under Otto William, son of Albert or Adalbert, king of Italy (d. 1027), who on the death of his father-in-law, Henry (1002) tried to seize the duchy of Burgundy, but without success. The countship, which formed a fief dependent on the kingdom of Burgundy, passed to Renaud I., the second son of Otto William. When the kingdom of Burgundy was joined to the Germanic empire, he refused to pay homage to the emperor Henry III., whose suzerainty over him never existed except in theory. William I. (1059–1087) still further added to the power of his house by marrying Etienne, the

heir of the count of Vienne, and by acquiring from his cousin Guy, when the latter became a monk at Cluny, the countship of Mâcon. One of his sons, Guy, became pope, under the name of Calixtus II. His grandson, Renaud III. (1097–1148) in his turn refused to pay homage to the emperor Lothair, who retaliated by confiscating his dominions and giving them to Conrad of Zähringen. Renaud, however, succeeded in maintaining until his death his possession of the countships of Burgundy, Vienne, and Mâcon. He left as sole heir a daughter, Beatrix, whom his brother William III. imprisoned in order to make an attempt on her inheritance; she was set free, however, by the emperor Frederick Barbarossa, who married her in 1156.

On the death of Beatrix (1185) the countship of Burgundy passed to Otto I. (1190–1200) the youngest but one of her sons, who had to dispute its possession with Stephen, count of Auxonne the grandson of William III. Beatrix, the daughter and heir of Otto I. (1200–31), married Otto, duke of Meran (d. 1234), under whose government the inhabitants of Besançon, which had been since the time of Frederick Barbarossa an imperial city, formed themselves definitely into a *commune*. Alix, daughter of Beatrix and of Otto of Meran, and heir to the countship of Burgundy, married Hugh of Chalon, son of John the Ancient or the Wise (d. 1248), a descendant of William III., restoring the countship to the family of its former lords. His son Otto IV. (1279–1303) engaged in war against the Bishop of Basle, and the German king Rudolph I., who supported the latter, entered Franche-Comté and besieged Besançon, but without success (1289). Otto, in fulfilment of the treaties of Ervennes and Vincennes (1291–95) gave Jeanne, his daughter by Mahaut of Artois, in marriage to Philip, count of Poitiers, son of Philip the Fair. The latter took over the administration of the countship, in spite of strong opposition from the nobles of the country. Another of Otto's daughters married Charles IV., the Handsome, and both princesses, together with their sister-in-law Margaret of Burgundy, were concerned in the celebrated trial of the Tour de Nesle. Jeanne, however, continued to govern her countship when her husband became king of France (Philip V., "the Long"). Jeanne, their daughter and heir, married Odo IV., duke of Burgundy (1330–47), and her sister Margaret became the wife of Louis II., count of Flanders. The countship returned to Margaret at the death of Odo IV., who was succeeded in his duchy by his grandson Philip of Rouvre.

The marriage of Philip the Bold with Margaret, daughter of Louis of Mâle, caused Franche-Comté to pass to the princes of the ducal house of Burgundy, who kept it until the death of Charles the Bold (1477). On his death Louis XI. claimed the government of the countship as well as of the duchy, as trustee for the property of the princess Mary, who was closely related to him and destined to marry the dauphin (later Charles VIII.). French garrisons occupied the principal towns, and the lord of Craon was appointed governor of the county. In consequence of his severity there was a general rising, and at the same time Mary married Maximilian, archduke of Austria, to whom her father had formerly betrothed her (Aug. 1477). The French were expelled from the fortified towns and Craon beaten by the people of Dôle. Charles of Amboise, who took his place, reconquered the province, and even Besançon submitted to the authority of the king of France, who promised to respect its privileges.

On the death of Louis XI. (1483), the estates of Franche-Comté recognized as sovereign his son Charles, who was betrothed to the little Margaret of Burgundy, daughter of Maximilian and Mary (d. 1482) but when Charles VIII. refused Margaret's hand in order to marry Anne of Brittany there was a fresh rising, and the French were again driven out. The treaty of Senlis (May 23, 1483) put an end to the struggle. Charles abandoned all his pretensions, and Maximilian was thus left in possession of Franche-Comté, the sovereignty of which he handed on to his son Philip and ultimately to the crown of Spain. He had, however, constituted his daughter Margaret sovereign-governess of Franche-Comté for life, and under the administration of this princess (d. 1530) as under the rule of Charles V., the county enjoyed comparative independence, paying a *don gratuit* of 200,000 livres

every three years, and being actually governed by the parliament of Dôle, and by governors chosen from the nobility of the country. Franche-Comté furnished Philip II. of Spain with one of his best counsellors, Cardinal Perrenot de Granvelle.

In the 16th century the country was disturbed by the preaching of Protestant doctrines, which gained adherents especially in the district of Montbéliard, and later by the wars between France and Spain. In 1595 the armies of Henry IV. levied contributions on Besançon and other towns; but the people of Franche-Comté succeeded in obtaining special terms of neutrality in order to shelter themselves from injury from either of the parties in the war, and enjoyed a period of calm under the government of the infanta Isabella Clara Eugénie and the archduke Albert (1599–1621). But the country suffered greatly from the ravages of the Thirty Years' War, from the presence of the army of the Condés, which besieged Dôle, from the devastation of the troops of Gallas, and later of those of Bernard of Saxe-Weimar. The Peace of Westphalia (1648) confirmed Spain in the possession of Franche-Comté. In 1668 the French again entered it, and the conquest, of which the foundations had been laid by the intrigues of the abbot of Watteville and the French party constituted by him, was easily accomplished by Condé and Luxemburg, Louis XIV. directing the army in Franche-Comté for some time in person. None the less, the country was restored to Spain at the Peace of Aix-la-Chapelle (1668), but in 1674 Louis headed another expedition there. Besançon capitulated after a siege of 27 days, and Dôle and Salins also fell into the hands of the invaders.

In 1678 the treaty of Nijmegen gave Franche-Comté to France (the principality of Montbéliard remaining in the possession of the house of Würtemberg which had acquired it by marriage. Franche-Comté became a military government (*gouvernement*). The estates ceased to meet, and the old *don gratuit* was replaced by a tax which became increasingly heavy. Louis made Besançon, which Vauban fortified, into the capital of the province, and transferred to it the parliament and the university, the seat of which had hitherto been Dôle. For purposes of administration, the county was divided among the four great *bailliages* of Besançon, Dôle, Amont, (chief town Vesoul) and Aval (chief town Salins). At the Revolution were formed from it the departments of Jura, Doubs, and Haute-Saône.

See Dunod, *Histoire de Sequanois: Hist. du comté de Bourgogne* (Dijon, 1735–40); E. Clerc, *Essai sur l'histoire de la Franche-Comté* (2nd ed., Besançon 1870). (R. P.)

FRANCHET D'ESPEREY, LOUIS (1856–), French soldier, was born at Mostaganem in Algeria on May 25, 1856. Commissioned to the infantry in 1876, he saw active service in Tunisia, Tongking and N. China. In 1908 he became general of brigade and made a careful study on the spot of Balkan conditions. In 1913, as general of division, he fought in Morocco, after which he was appointed to the I. Army Corps at Lille. This corps he commanded during the battle of the Frontiers, Aug. 1914, and on the eve of the battle of the Marne he succeeded Gen. Lanrezac as commander of the V. Army. In March 1916 he was advanced to command the eastern group of armies, and later the northern group. On the recall of Guillaumat in June 1918, Franchet d'Esperey was sent out to replace him as commander-in-chief at Salonika. Adopting and developing his predecessor's plan for an offensive in the Balkans, he ensured the success of his break-through by the skill with which he denuded the rest of the front to concentrate an overwhelming preponderance on the narrow Sokol-Dobropolye sector, west of the Vardar. Success beyond anticipation crowned the stroke; with their reserves pinned down by vigorous pressure elsewhere the Bulgarians were unable to repair the breach, and as the Serbian spearhead drove in deeper, the whole Bulgarian front collapsed, and on Sept. 29 Bulgaria capitulated—the first defection among the Central Powers. He cleared Serbia of the Austrian troops and later, on Jan. 5, 1919, took prisoner the German Marshal von Mackensen, in Hungary. He commanded the Allied forces in Turkey until Nov. 1920, and was created a marshal of France on Feb. 21, 1921.

See Graffet, *Le maréchal Franchet d'Esperey* (1922).

FRANCHISE, in English law, a royal privilege or branch of

the Crown's prerogative subsisting in the hands of a subject. A franchise arises either from royal grants or from prescription which presupposes a grant. Such franchises are bodies corporate, the right to hold a fair, market, ferry, free fishery, etc. The term is also applied to the right of voting at elections and the qualifications upon which that right is based (*see* REGISTRATION; REPRESENTATION; VOTE). In the United States the term is especially applied to the right or powers of partial appropriation of public property by exclusive use, or to a privilege of a public nature conferred on a corporation created for the purpose, and also to the right of voting at elections.

FRANCIA (c. 1450–1517), a Bolognese painter and goldsmith, whose real name was Francesco Raibolini, his father being Marco di Giacomo Raibolini, a carpenter, descended from an old and creditable family, was born at Bologna about 1450. Francia was originally a goldsmith and also an engraver of dies and niellos; in these arts he became eminent. Two niello Paxes executed between 1480–85 are to be seen at the Bologna academy. He was particularly famed for his dies for medals; he rose to be mint-master at Bologna, and retained that office to the end of his life. As a type-founder he made for Aldus Manutius the first italic type.

He may have studied painting under Francesco Cossa, who settled at Bologna in 1470. His earliest known picture, dated 1492, is the "Virgin and Child" in the Mond Collection, National Gallery, London. Another early work, dated 1494, is now in the Bologna gallery—the "Virgin enthroned, with Augustine and five other saints." It is an oil picture, and was originally painted for the church of St. Maria della Misericordia, at the desire of the Bentivoglio family, the rulers of Bologna. The same patrons employed him upon frescoes in their own palace; one of "Judith and Holofernes" is especially noted. Unfortunately these works were destroyed. Francia probably studied likewise the works of Perugino; and he became a friend and ardent admirer of Raphael, to whom he addressed an enthusiastic sonnet. Raphael cordially responded to the Bolognese master's admiration, and said, in a letter dated in 1508, that few painters or none had produced Madonnas more beautiful, more devout, or better portrayed than those of Francia. If we may trust Vasari the exceeding value which Francia set on Raphael's art brought him to his grave. Raphael had consigned to Francia his famous picture of "St. Cecilia," destined for the church of S. Giovanni in Monte, Bologna; and Francia, on inspecting it, took so much to heart his own inferiority, at the advanced age of about 66, to the youthful Umbrian, that he sickened and died on Jan. 6, 1517.

Distanced though he may have been by Raphael, Francia is rightly regarded as the greatest painter of the earlier Bolognese school. His style in some respects recalls the art of Lorenzo Costa. His figures are graceful and his work beautifully finished. The National Gallery contains two remarkably fine specimens of Francia, combined together as principal picture and lunette—the "Virgin and Child and St. Anna" enthroned, surrounded by saints, and (in the lunette) the "Pietà." They come from the Buonvisi chapel in the church of S. Frediano, Lucca, and were among the master's latest paintings. Other leading works are: in Munich "The Madonna within the Rose Garden"; in the Borghese gallery, Rome, "St. Stephen the Martyr"; in Bologna the frescoes in the church of St. Cecilia, illustrating the life of the saint, all of them from the design of Francia, but not all executed by himself. His landscape backgrounds are of uncommon excellence. The finest extant drawing of the master is the "Judgment of Paris" in the Albertina at Vienna. Francia had many scholars. Marcantonio Raimondi, the famous engraver, is the most renowned of them; next to him Amico Aspertini, and Francia's own sons Giacomo and Giulio. Lorenzo Costa was much associated with Francia in pictorial work.

FRANCIA, JOSÉ GASPAR RODRÍGUEZ (c. 1766–1840), "El Supremo," dictator of Paraguay, was born in Paraguay, about 1766, probably the son of a Brazilian coffee grower. He studied at the university of Córdoba de Tucumán, and obtained there the degrees of master of philosophy and doctor of theology. Relinquishing his intention of taking orders, he studied law and practised in Asunción, where he acquired a reputation for ability, energy and integrity. Under the colonial Government he filled several important posts, and when independence was declared in 1811, he became secretary to the national *junta*, exerting an influence far out of proportion to his position. In 1813, when a duumvirate replaced the national congress, Francia and Gen. Yegros, a gaucho, were chosen to fill the office. In 1814 he secured his election as dictator for three years, and in 1817 obtained the dictatorship for life. In his administration we find a strange mixture of far-sighted statesmanship and petty despotism. Seeing his precarious position among powerful neighbours, he pursued a policy of strict isolation; realizing that he must make the country self-supporting, he carefully fostered internal industries. He put a stop to foreign commerce; usurped the national revenues; organized and equipped an army, and imported modern methods of agriculture. Imbued with the principles of the French Revolution, he abolished the Inquisition, suppressed the college of theology, did away with the tithes, and deprived the aristocracy of their social and political privileges. While practising republican simplicity in his private life, he exacted imperial deference wherever he went, isolated himself in the most stringent manner, and punished with Draconian severity the slightest violation of his assumed prerogatives or hint of conspiracy against him. On Sept. 20, 1840, he was seized with a fit in Asunción, and died. Whatever may be the accusations brought against his rule, it is unlikely that except for him the country could have escaped incorporation in either Argentina or Brazil. (W. B. P.)

The first and fullest account of Dr. Francia was given to the world by two Swiss surgeons, Rengger and Longchamp, whom he had detained from 1819 to 1825—*Essai historique sur la révolution de Paraguay et la gouvernement dictatorial du docteur Francia* (Paris, 1827). Their work was almost immediately translated into English under the title of *The Reign of Doctor Joseph G. R. De Francia in Paraguay* (1827). About eleven years after there appeared at London *Letters on Paraguay*, by J. P. and W. P. Robertson, two young Scotsmen whose hopes of commercial success had been rudely destroyed by the dictator's interference. The account which they gave of his character and government was of the most unfavourable description, and they rehearsed and emphasized their accusations in *Francia's Reign of Terror* (1839) and *Letters on South America* (3 vols., 1843). From the very pages of his detractors Thomas Carlyle succeeded in extracting materials for a brilliant defence of the dictator "as a man or sovereign of iron energy and industry, of great and severe labour." It appeared in the *Foreign Quarterly Review* for 1843, and is reprinted in his *Critical and Miscellaneous Essays*. Sir Richard F. Burton gives a graphic sketch of Francia's life and a favourable notice of his character in his *Letters from the Battlefields of Paraguay* (1870), while C. A. Washburn takes up a hostile position in his *History of Paraguay* (1871).

FRANCIABIGIO (1482–1525), Florentine painter. His real name was Francesco di Cristofano; and he was currently termed Francia Bigio, Francia standing for Francesco and Bigio being the surname. His father was a Milanese weaver, settled in Florence. According to Vasari, Franciabigio when young worked in the company of Andrea del Sarto. He studied under Albertinelli for a few months, and he was devoted to the study of perspective. One of his early works is the so-called Madonna del Pozzo in the Uffizi gallery which was for some time ascribed to Raphael. In the Atrium of the Annunziata in Florence he painted in 1513 the "Marriage of the Virgin," as a portion of a series wherein Andrea del Sarto was chiefly concerned. The friars having uncovered this work before it was quite finished, Franciabigio was so incensed that, seizing a mason's hammer, he struck at the head of the Virgin, and some other heads; and the fresco, which would otherwise be his masterpiece in that method, remains thus mutilated. At the Chiostrò dello Scalzo, in an-

other series of frescoes in which Andrea was likewise employed, he executed in 1518–19 the "Departure of John the Baptist for the Desert," and the "Meeting of the Baptist with Jesus"; and, at the Medici palace at Poggio a Caiano, in 1521, the "Triumph of Cicero." Franciabigio was a first-rate portrait painter (Berlin, Pitti, National Gallery, London). The Dresden gallery contains one of his masterpieces, the "Bath of Bathsheba" (1523).

FRANCIS, a masculine proper name meaning "Frenchman" (Lat. *Franciscus*, Ital. *Francesco*, Fr. *François*, Ger. *Franz*). As a Christian name it originated with St. Francis of Assisi, whose baptismal name was Giovanni, but who was called Francesco by his father on returning from a journey in France. The saint's fame made the name exceedingly popular from his day onwards.

FRANCIS I. (1708–1765), Roman emperor and grand duke of Tuscany, second son of Leopold Joseph, duke of Lorraine, was born on Dec. 8, 1708. He married in 1736 Maria Theresa (q.v.), daughter of the emperor Charles VI. He succeeded his father as duke of Lorraine in 1729, but the emperor, at the end of the Polish War of Succession, desiring to compensate Stanislaus Leszczyński for the loss of his crown in 1735, persuaded Francis to exchange Lorraine for the reversion of the grand duchy of Tuscany. His wife secured his election to the Empire on Sept. 13, 1745, in succession to Charles VII., and she made him co-regent of her hereditary dominions. Francis was well content to leave the reality of power to his able wife. He died at Innsbruck on Aug. 18, 1765. See MARIA THERESA.

FRANCIS II. (1768–1835), the last Roman emperor, and, as Francis I., first emperor of Austria, was the son of Leopold II., grand-duke of Tuscany, afterwards emperor, and of his wife Maria Louisa, daughter of Charles III. of Spain. He was born at Florence on Feb. 12, 1768. In 1784 he was brought to Vienna to complete his education under the eye of his uncle the emperor Joseph II. Joseph is said to have treated his nephew with an impatient contempt which confirmed his natural timidity; but after the marriage of Francis to Elizabeth of Württemberg (1788) their relations improved. The death of his wife in childbirth on Feb. 18, 1790 was followed by the death of his uncle on the 20th; and Francis acted as regent with Prince Kaunitz until his father came from Florence. On Sept. 19, he married his first cousin Maria Theresa, daughter of Ferdinand, king of Naples, by whom he was the father of his successor Ferdinand I., of Maria Louisa, wife of Napoleon, and of the archduke Francis, father of the emperor Francis Joseph. After her death (1807) he married Maria Ludovica Beatrix of Este (1808), and when she died he made a fourth marriage with Carolina Augusta of Bavaria (1816).

He succeeded in his twenty-fifth year to the Austrian dominions and the empire on the death of his father on March 1, 1792. The dominions of the house of Austria, widely scattered in the Low Countries, Germany and Italy, were exposed to the attacks of the French revolutionary governments and of Napoleon. He was dragged into all the coalitions against France, and in the early days of his reign he had to guard against the ambition of Prussia, and the aggressions of Russia in Poland and Turkey. For long he had no adviser save such diplomatists as Prince Kaunitz and Thugut, who had been trained in the Old Austrian diplomacy. His own best quality was an invincible patience supported by reliance on the loyalty of his subjects, and a sense of his duty to the State. (For the general events of this reign till 1815 see EUROPE, AUSTRIA, NAPOLEON, FRENCH REVOLUTIONARY WARS, etc.) Seeing that the Empire was in the last stage of dissolution, and that, even were it to survive, it would pass from the house of Habsburg to that of Bonaparte, he in 1804 assumed the title of hereditary emperor of Austria, thus giving some semblance of unity to his complex dominions in Germany, Bohemia, Hungary and Italy, by providing a common title for the supreme ruler. His action was justified when, in 1806, the establishment of the Confederation of the Rhine forced him to abdicate the empty title of Holy Roman emperor.

In 1805 he changed the basis of his administration. He had hitherto been assisted by a cabinet minister who was in direct relation with all the "chanceries" and boards which formed

the executive government, and who acted as the channel of communication between them and the emperor and was in fact a prime minister. In 1805 Napoleon insisted on the removal of Count Colloredo, who held the post. From that time forward the emperor Francis acted as his own prime minister, superintending every detail of his administration. In foreign affairs after 1809 he reposed full confidence in Prince Metternich. But Metternich himself declared at the close of his life that he had sometimes held Europe in the palm of his hand, but never Austria. Francis was sole master, and the history of the Austrian empire under his rule and after his death bears testimony to both his merits and his limitations. His indomitable patience and loyalty to his inherited task enable him to triumph over Napoleon. By consenting to the marriage of his daughter, Marie Louise, to Napoleon in 1810, he gained a respite which he turned to good account. By following the guidance of Metternich in foreign affairs he was able to intervene with decisive effect in 1813. The settlement of Europe in 1815 left Austria stronger and more compact than she had been in 1792, and that this was the case was largely due to the emperor.

During the 20 years which preceded his death in 1835, Francis was wholly in sympathy with the policy of "repression" which came, in popular view, to be identified with the Holy Alliance; and though Metternich was primarily responsible for the part played by Austria in the "policing" of Europe, Francis cannot but be held personally responsible for the cruel and impolitic severities, associated especially with the sinister name of the fortress prison of the Spielberg, which made so many martyrs to freedom. He was denounced by Liberals throughout Europe as a tyrant and an obscurantist. Nevertheless he was always popular among the mass of his subjects, who called him "our good Kaiser Franz." His capital error as a ruler of Austria was that he persisted in a system of administration which depended upon the indefatigable industry of a single man. Government in Austria broke down under a successor who had not his capacity for work. Francis died on March 2, 1835.

See Wolfgruber, *Franz I. Kaiser von Österreich* (2 vols., 1899). Ample bibliographies will be found in Krones von Marchland's *Grundriss der österreichischen Geschichte* (Berlin, 1882). See also HABSBURG.

FRANCIS I. (1494-1547), king of France, son of Charles of Valois, count of Angoulême, and Louise of Savoy, was born at Cognac on Sept. 12, 1494. On the accession of Louis XII. in 1498, Francis became heir-presumptive. Louis invested him with the duchy of Valois, and gave him as tutor Marshal de Gié, and, after Gié's disgrace in 1503, the sieur de Bois, Artus Gouffier. François de Rochefort, abbot of St. Mesmin, instructed Francis and his sister Marguerite in Latin and history; Louise herself taught them Italian and Spanish.

The Knight.—Francis showed a great love for violent exercises, such as hunting, which was his ruling passion, and tennis, and for tournaments, masquerades and amusements of all kinds. His earliest gallantries are described by his sister in the 25th and 42nd stories of the *Heptameron*. He married Claude, daughter of Louis XII., on May 18, 1514, and succeeded to the throne on Jan. 1, 1515. In the early years of his reign the government was chiefly in the hands of Louise of Savoy, Chancellor Antoine Duprat, Secretary Florimond Robertet, and the two Gouffiers, Bois and Bonivet. The royal favour then elevated Anne de Montmorency and Philippe de Chabot, and in the last years of the reign Marshal d'Annebaud and Cardinal de Tournon. Women had a great influence over Francis—his sister, Marguerite d'Angoulême, and his mistresses. Whatever the number of these, he had only two titular mistresses—at the beginning of the reign Françoise de Châteaubriant, and from about 1526 to his death Anne de Pisseleu, whom he created duchesse d'Etampes and who entirely dominated him. It has not been proved that he was the lover of Diane de Poitiers, nor does the story of "La belle Ferronnière" appear to rest on any historical foundation. (See Paulin Paris, *Études sur le règne de François Ier*.)

The Statesman.—Circumstances alone gave a homogeneous character to the foreign policy of Francis. The struggle against the emperor Charles V. filled the greater part of the reign. In reality,

the policy of Francis, save for some flashes of sagacity, was irresolute and vacillating. Attracted at first by Italy, he led the triumphal Marignano expedition (1515), which gained him reputation as a knightly king and as the most powerful prince in Europe. In 1519, in spite of wise counsels, he stood as candidate for the imperial crown. The election of Charles V. caused an inevitable rivalry between the two monarchs which accentuated the light and chivalrous temper of the king and the cold and politic character of the emperor. Francis's personal intervention in this struggle was seldom happy. He did not succeed in gaining the support of Henry VIII. of England in 1520; his want of tact goaded the Constable de Bourbon to extreme measures in 1522-1523; and in the Italian campaign of 1525 he proved himself a vacillating and foolhardy leader, and by his blundering led the army to the disaster of Pavia (Feb. 25, 1525), where, however, he fought with great bravery (see ITALY: History). "Of all things," he wrote to his mother after the defeat, "nothing remains to me but honour and life, which is safe"—the authentic version of the legendary phrase "All is lost save honour." He strove to play the part of royal captive heroically, but the prison life galled him. He fell ill at Madrid and was on the point of death. For a moment he thought of abdicating rather than of ceding Burgundy. But this was too great a demand upon his fortitude, and he yielded and signed the treaty of Madrid (1526). After Madrid he wavered unceasingly between two courses: that of continuing hostilities, and the policy favoured by Montmorency of peace and understanding with the emperor. At times he had the sagacity to recognize the utility of alliances, as was shown by those he concluded with the Porte and with the Protestant princes of Germany. But he could never pledge himself frankly in one sense or the other, and this vacillation prevented him from attaining any decisive results. At his death, however, France was in possession of Savoy and Piedmont.

Religion.—In his religious policy Francis showed the same instability. Drawn between various influences, that of Marguerite d'Angoulême, the du Bellays, and the duchesse d'Etampes, who was in favour of the Reformation or at least of toleration, and the contrary influence of the uncompromising Catholics, Duprat, and then Montmorency and de Tournon, he gave pledges successively to both parties. In the first years of the reign, following the counsels of Marguerite, he protected Jacques Lefèvre d'Étaples and Louis de Berquin, and showed some favour to the new doctrines. But the violence of the Reformers threw him into the arms of the opposite party. The affair of the Placards in 1534 determined him to adopt a policy of severity. From that time, in spite of occasional indulgences shown to the Reformers, due to his desire to conciliate the Protestant powers, Francis gave a free hand to the party of repression, of which the most active and most pitiless member was Cardinal de Tournon; and the end of the reign was sullied by the massacre of the Waldenses (1545).

The Ruler.—Francis introduced new methods into government. In his reign the monarchical authority became more imperious and more absolute. His was the government "*du bon plaisir*." By the unusual development he gave to the court he converted the nobility into a brilliant household of dependents. The Concordat brought the clergy into subjection, and enabled him to distribute benefices at his pleasure among the most docile of his courtiers. He governed in the midst of a group of favourites, who formed the *conseil des affaires*. The states-general did not meet, and the remonstrances of the *parlement* were scarcely tolerated. By centralizing the financial administration by the creation of the *Trésor de l'Épargne*, and by developing the military establishments, Francis still further strengthened the royal power. His government had the vices of his foreign policy. It was uncertain, irregular and disorderly. The finances were squandered in gratifying the king's unbridled prodigality, and the treasury was drained by his luxurious habits, by the innumerable gifts and pensions he distributed among his mistresses and courtiers, by his war expenses and by his magnificent buildings. His government, too, weighed heavily upon the people, and he was less popular than is sometimes imagined.

Francis owes the greater measure of his glory to the artists and

men of letters who vied in celebrating his praises. He was pre-eminently the king of the Renaissance. Of a quick and cultivated intelligence, he had a sincere love of letters and art. He holds a high place in the history of humanism by the foundation of the Collège de France; he did not found an actual college, but after much hesitation instituted in 1530, at the instance of Guillaume Budé (Budaëus), *Lecteurs royaux*, who in spite of the opposition of the Sorbonne were granted full liberty to teach Hebrew, Greek, Latin, mathematics, etc. The humanists Budé, Jacques Colin and Pierre Duchâtel were the king's intimates, and Clément Marot was his favourite poet. Francis sent to Italy for artists and for works of art, but he protected his own countrymen also. Here, too, he showed his customary indecision, wavering between the two schools. At his court he installed Benvenuto Cellini, Francesco Primaticcio and Rosso del Rosso, but in the buildings at Chambord, St. Germain, Villers-Cotterets and Fontainebleau the French tradition triumphed over the Italian.

Francis died on March 31, 1547. By his first wife Claude (d. 1524) he had three sons and four daughters: Louise, who died in infancy; Charlotte, who died at the age of eight; Francis (d. 1536); Henry, who came to the throne as Henry II.; Madeleine, who became queen of Scotland; Charles (d. 1545); and Margaret, duchess of Savoy. In 1530 he married Eleanor, the sister of the emperor Charles V.

BIBLIOGRAPHY.—For the official acts of the reign, the *Catalogue des actes de François Ier*, published by the Académie des Sciences morales et politiques (1887-1907), is a valuable guide. The Bibliothèque Nationale, the National Archives, etc., contain a mass of unpublished documents. Of the published documents, see N. Camuzat, *Mélanges historiques* . . . (Troyes, 1619); G. Ribier, *Lettres et mémoires d'état* (1666); *Lettres de Marguerite d'Angoulême*, ed. by F. Genin (1841 and 1842); the *Correspondance de Castillon et Marillac* (ed. Kaulek, 1885); of *Odé de Selve* (ed. by Lefèvre-Pontalis, 1888), and of *Guillaume Pellucier* (ed. Tausserat-Radel, 1900); *Captivité du roi François Ier*, and *Poésies de François Ier* (both ed. by Champollion-Figeac, 1847, of doubtful authenticity); *Relations des ambassadeurs vénitiens*, etc. Of the memoirs and chronicles, see the journal of Louise of Savoy in S. Guichenon's *Histoire de la maison de Savoie*, vol. iv. (ed. of 1778-80); *Journal d'un bourgeois de Paris*, ed. by Lalanne (1854); *Cronique du roy François Ier*, ed. by Guiffrey (1868); *Journal de Jean Barillon*, ed. by de Vaissière (1897-99); and the memoirs of Fleuranges, Montluc, Tavannes, Vieilleville, Brantôme and especially Martin du Bellay (coll. Michaud and Poujoulat). Of the innumerable secondary authorities, see especially Paulin Paris, *Études sur le règne de François Ier* (1885), in which the apologetic tendency is excessive; and H. Lemonnier in vol. v. (1903-04) of E. Lavisse's *Histoire de France*, which gives a list of the principal secondary authorities. There is a more complete bibliographical study by V. L. Bourrilly in the *Revue d'histoire moderne et contemporaine*, vol. iv. (1902-03). The printed sources have been catalogued by H. Hauser, *Les Sources de l'histoire de France, XVI^e siècle*, tome ii. (1907). (J. I.; X.)

FRANCIS II. (1544-1560), king of France, eldest son of Henry II. and of Catherine de' Medici, was born at Fontainebleau on Jan. 19, 1544. He married Mary Stuart (see MARY, QUEEN OF SCOTS), daughter of James V. of Scotland, on Aug. 25, 1558, and ascended the French throne on July 10, 1559. During his short reign the young king, a sickly youth and of feeble understanding, was the mere tool of his uncles Francis, duke of Guise, and Charles, cardinal of Lorraine, into whose hands he virtually delivered the reins of government. After the failure of the conspiracy of Amboise, directed against the Guises the duke of Guise became lieutenant-general of the kingdom, but his Catholic leanings were somewhat held in check by the chancellor Michel de l'Hôpital (*q.v.*). Francis II. died on March 5, 1560.

See Ernest Lavisse, *Histoire de France* (vol. vi. by J. H. Mariéjol, 1904), which contains a bibliography.

FRANCIS I. (1777-1830), king of the Two Sicilies, was the son of Ferdinand IV. (I.) and Maria Carolina of Austria. He married Clementina, daughter of the emperor Leopold II. of Austria, in 1796, and at her death Isabella, daughter of Charles IV. of Spain. Francis was appointed regent in Sicily in 1812. On the fall of Napoleon his father returned to Naples and suppressed the Sicilian constitution and autonomy, incorporating his two kingdoms into that of the Two Sicilies (1816); Francis then assumed the revived title of duke of Calabria. On succeeding to the throne in 1825 he showed himself as reactionary as his father.

He left the government in the hands of favourites and police officials, and lived with his mistresses, surrounded by soldiers, ever in dread of assassination. During his reign the only revolutionary movement was the outbreak on the Cilento (1828), savagely repressed by the marquis Delcarretto, an ex-Liberal turned reactionary.

See N. Nisco, *Il Reame di Napoli sotto Francesco I.* (Naples, 1893).

FRANCIS II. (1836-1894), king of the Two Sicilies, son of Ferdinand II. and Maria Cristina of Savoy, was the last of the Bourbon kings of Naples. He ascended the throne on May 22, 1859. He at once appointed Carlo Filangieri (*q.v.*), as prime minister but did not take his sensible advice, and Filangieri soon resigned. On June 7 a part of the Swiss Guard mutinied, and while the king mollified them by promising to redress their grievances, General Nunziante collected other troops, who surrounded the mutineers and shot them down. Cavour repeated an earlier proposal for an alliance to divide the papal states between Piedmont and Naples, the province of Rome excepted, but Francis rejected an idea which to him savoured of sacrilege. Meanwhile the revolutionary parties were conspiring for the overthrow of the Bourbons in Calabria and Sicily, and Garibaldi was preparing for the conquest of Sicily (see GARIBALDI). These events at last frightened Francis into granting a constitution, but its promulgation was followed by disorders in Naples and the resignation of ministers, and Liborio Romano became head of the government. Garibaldi who had crossed the straits of Messina, was advancing northwards. Francis, after long hesitations and even an appeal to Garibaldi himself, left Naples (Sept. 6) with his wife Maria Sophia, the court, the diplomatic corps (the French and English ministers excepted), and went by sea to Gaeta, where a large part of the army was concentrated. The next day Garibaldi entered Naples, was enthusiastically welcomed, and formed a provisional government. Garibaldi's troops defeated the Neapolitan royalists on the Volturno (Oct. 1-2), while the Piedmontese under Victor Emmanuel captured Capua. The siege of Gaeta by the Piedmontese began on Nov. 6, 1860. The fortress capitulated on Feb. 12, 1861, and Francis was driven from his kingdom. He died on Dec. 27, 1894 at Arco in Tirol.

BIBLIOGRAPHY.—R. de Cesare, *La Fine d'un regno*, vol. ii. (Città di Castello, 1900) gives a detailed account of the reign of Francis II., while H. R. Whitehouse's *Collapse of the Kingdom of Naples* (1899) may be recommended to English readers; G. Nisco's *Francesco II.* (Naples, 1887) should also be consulted. See under NAPLES; GARIBALDI; BIXIO NINO; CAVOUR; ITALY; FILANGIERI; etc.

FRANCIS IV. (1779-1846), duke of Modena, was the son of the archduke Ferdinand, Austrian governor of Lombardy, who acquired the duchy of Modena through his wife Marie Beatrice, heiress of the house of Este as well as of many fiefs of the Malaspina, Pio da Carpi, Pico della Mirandola, Cibo, and other families. At the time of the French invasion (1796) Francis was sent to Vienna to be educated, and in 1809 was appointed governor of Galicia. He married the daughter of the exiled king of Sardinia, Victor Emmanuel I., and a secret family compact was made whereby if the king and his two brothers died without male issue, the Salic law would be changed so that Francis should succeed to the kingdom instead of Charles Albert of Carignano (N. Bianchi, *Storia della diplomazia europea in Italia*, vol. i. 42-43; 1865-72). (For the family connection see the genealogical table s.v. SAVOY.) On the fall of Napoleon in 1814 Francis received the duchy of Modena, including Massa-Carrara and Lunigiana.

The duke soon showed himself one of the most reactionary despots in Italy. Against the Carbonari and other Liberals he issued the severest edicts, and although there was no revolt at Modena in 1821 as in Piedmont and Naples, he immediately instituted judicial proceedings against the supposed conspirators. Some 350 persons were arrested and tortured, 56 being condemned to death (only a few of them were executed) and 237 to imprisonment; a large number, however, escaped, including Antonio Panizzi (afterwards director of the British Museum). The ferocious police official Besini who conducted the trials was afterwards murdered. The duke actually proposed to Prince Metternich, the Austrian chancellor, an agreement whereby the various Italian rulers were to arrest every Liberal in the country on a

certain day, but the project fell through owing to opposition from the courts of Florence and Rome. At the congress of Verona Metternich made another attempt to secure the Piedmontese succession for Francis, but without success. Modena swarmed with spies and informers, and the least expression of liberalism, or even failure to denounce a Carbonaro, involved arrest and imprisonment.

But strange to say, in 1830 we find Francis actually coquetting with revolution, in the person of Ciro Menotti, who seems to have offered help in the matter of the Piedmontese succession. But Menotti failed, and after the abortive revolution of 1831 Francis had him executed.

On Feb. 20, 1846, Francis died. He was certainly the ablest of the Italian despots, but Liberalism was in his eyes the most heinous of crimes, and his reign is one long record of barbarous persecution.

FRANCIS V. (1819–1875), duke of Modena, son of Francis IV., succeeded his father in 1846. His reign began with disturbances at Fivizzano and Pontremoli, which Tuscany surrendered to him according to treaty but against the wishes of the inhabitants (1847), and also at Massa and Carrara, where the troops shot down the people. The duke asked for and obtained an Austrian garrison, but on the outbreak of revolution throughout Italy and at Vienna in 1848, he fled with his family to Mantua. A provisional government was formed, and volunteers were raised who fought with the Piedmontese against Austria. After the Piedmontese defeat Francis returned to Modena, with Austrian assistance, in August and conferred many appointments on Austrian officers. The disturbances at Carrara were ruthlessly suppressed, and the prisons filled with "politicals." In 1859 numbers of young Modenese fled across the frontier to join the Piedmontese army, as war with Austria seemed imminent; and after the Austrian defeat at Magenta the duke left Modena to lead his army in person against the Piedmontese. The events of 1859–1860 made his return impossible; and after a short spell of provisional government the duchy was united to Italy. He retired to Austria, and died at Munich in November 1875.

FRANCIS, SIR PHILIP (1740–1818), English politician and pamphleteer, the supposed author of the *Letters of Junius*, and the chief antagonist of Warren Hastings, was born in Dublin on Oct. 22, 1740. He was educated at a Dublin free school, privately, and at St. Paul's school, London. In 1756, immediately on his leaving school, he was appointed to a junior clerkship in the secretary of State's office by Henry Fox (afterwards Lord Holland), and this post he retained under the succeeding administration. In 1758 he was employed as secretary to Gen. Bligh in the expedition against Cherbourg; and in the same capacity he accompanied the earl of Kinnoul on his special embassy to the court of Portugal in 1760.

In 1762 he was appointed to a principal clerkship in the War Office, where he formed an intimate friendship with Christopher D'Oyly, the secretary of State's deputy, whose dismissal from office in 1772 was hotly resented by "Junius"; and in the same year he married Miss Macrabie, the daughter of a retired London merchant. In 1763 the great constitutional questions arising out of the arrest of Wilkes began to be sharply canvassed. It was natural that Francis, who from a very early age had been in the habit of writing occasionally to the newspapers, should be eager to take an active part in the discussion, though his position as a Government official made it necessary that his intervention should be carefully disguised. He is known to have written to the *Public Ledger* and *Public Advertiser*, as an advocate of the popular cause, on many occasions about and after the year 1763. His chief title to fame as a writer, however, is his supposed authorship of the *Letters of Junius*, of which the first appeared in Jan. 1769, and the series was continued till Jan. 21, 1772 (see JUNIUS).

In March 1772 Francis finally left the War Office, and in the following July started a continental tour which lasted until Dec. 1772. In June 1773 Lord North appointed him a member of the newly constituted supreme council of Bengal at a salary of £10,000 per annum. Along with his colleagues Monson and Clavering he reached Calcutta in Oct. 1774, and a long struggle with Warren Hastings, the governor-general, immediately began. These three formed a majority of the council in opposition to the governor-general's policy, accusing him of corruption, mainly on the evidence of Nuncomar. The death of Monson (1776) and of Clavering (1777) made Hastings again supreme in the council, and a dispute with Francis, led in Aug. 1780 to a minute being delivered to the council board by Hastings, in which he stated that "he judged of the public conduct of Mr. Francis by his experience of his private, which he had found to be void of truth and honour." A duel was the consequence, in which Francis received a dangerous wound (see HASTINGS, WARREN). His recovery was rapid and complete and he left for England where, on his arrival in Oct. 1781, he was received with little favour.

In 1784 Francis was returned by the borough of Yarmouth, Isle of Wight; and on the return of Hastings in 1785, did all in his power to bring forward and support the charges which ultimately led to the impeachment resolutions of 1787. He sympathized warmly with the French revolutionary doctrines, in 1793 supported Grey's motion for a return to the old constitutional system of representation, and was one of the founders of the "Society of the Friends of the People." The acquittal of Hastings in April 1795 disappointed Francis of the governor-generalship, and in 1798 he had to submit to the additional mortification of a defeat in the general election. He was once more successful, however, in 1802, when he sat for Appleby, but was not offered the governor-generalship on the Whig success in 1806, though he accepted a K.C.B. He was not re-elected for Appleby in 1807 and the remainder of his life was spent in comparative privacy.

Among the later productions of his pen were, besides the *Plan of a Reform in the Election of the House of Commons*, pamphlets entitled *Proceedings in the House of Commons on the Slave Trade* (1796), *Reflections on the Abundance of Paper in Circulation and the Scarcity of Specie* (1810), *Historical Questions Exhibited* (1818), and a *Letter to Earl Grey on the Policy of Great Britain and the Allies towards Norway* (1814). His first wife, by whom he had six children, died in 1806, and in 1814 he married his second wife, Emma Watkins, who long survived him, and who left voluminous manuscripts relating to his biography. Francis died on Dec. 23, 1818.

FRANCISCANS (otherwise called Friars Minor, or Minorites; and in England Grey Friars, from the colour of the habit, which, however, is now brown rather than grey), a religious order founded by St. Francis of Assisi (q.v.). It was in 1206 that St. Francis left his father's house and devoted himself to a life of poverty and to the service of the poor, the sick and the lepers; and in 1209 that he felt the call to add preaching to his other ministrations, and to lead a life in the closest imitation of Christ's. Within a few weeks disciples began to join themselves to him; the condition was that they should dispose of all their possessions. When their number was twelve Francis led the little flock to Rome to obtain the pope's sanction for their undertaking. Innocent III. received them kindly, but with some misgivings as to the feasibility of the proposed manner of life; these difficulties were overcome, and the pope accorded a provisional approval by word of mouth: they were to become clerics and to elect a superior. Francis was elected and made a promise of obedience to the pope, and the others promised obedience to Francis.

An Unorganized Fraternity.—This formal inauguration of the institute was in 1209 or (as seems more probable) 1210. On their return to Assisi they obtained from the Benedictine abbey on Mount Subasio the use of the little chapel of St. Mary of the Angels, called the Portiuncula, in the plain below Assisi, which became the cradle and headquarters of the order. Around the Portiuncula they built themselves huts of branches and twigs, but they had no fixed abode; they wandered in pairs over the country, dressed in the ordinary clothes of the peasants, working in the fields to earn their daily bread, sleeping in barns or in the hedge-rows or in the porches of the churches, mixing with the labourers and the poor, with the lepers and the outcasts. The key-note of the movement was the imitation of the public life of Christ, especially the poverty of Christ. Francis and his disciples were to aim at possessing nothing, absolutely nothing, so far as was compatible with life; they were to earn their bread from day to day by the work of their hands, and only when they could not do so were they to beg; they were to make no provision for the morrow, lay by no store, accumulate no capital, possess no land; but no austerities were practised beyond those inseparable from the life they lived.

Thus the institute in its original conception was a confraternity rather than an order, and there was no formal novitiate, no organization. But the number of brothers increased with extraordinary rapidity, and the field of work soon extended itself beyond the neighbourhood of Assisi and even beyond Umbria—within three or four years there were settlements in Perugia, Cortona, Pisa, Florence and elsewhere, and missions to the Saracens and Moors were attempted by Francis himself. About 1217 Franciscan missions set out for Germany, France, Spain, Hungary and the Holy Land; and in 1219 a number of provinces were formed, each governed by a provincial minister. These developments, whereby the little band of Umbrian apostles had grown into an institute, spread all over Europe and even penetrating to the East, and numbering thousands of members, rendered impossible the continuance of the original free organization whereby Francis's word and example were the sufficient practical rule of life for all: it was necessary as a condition of efficiency and even of existence and permanence that some kind of organization should be provided.

A Monastic Order.—From an early date yearly meetings or chapters had been held at the Portiuncula, at first attended by the whole body of friars; but as the institute extended this became unworkable, and after 1219 the chapter consisted only of the officials, provincial ministers and others. During Francis's absence in the East (1219–1220) a deliberate movement was initiated by the two vicars whom he had left in charge of the order, towards assimilating it to the monastic orders. Francis hurried back, bringing with him Elias of Cortona, the provincial minister of Syria, and immediately summoned an extraordinary general chapter (September 1220). Before it met he had an interview on the situation with Cardinal Hugolino of Ostia (afterwards Gregory IX.), the great friend and supporter of both Francis and Dominic, and he went to Honorius III. at Orvieto and begged that Hugolino should be appointed the official protector of the order. The request was granted, and a bull was issued formally approving the order of Friars Minor, and decreeing that before admission every one must pass a year's novitiate, and that after profession it was not lawful to leave the order. By this bull the Friars Minor were constituted an order in the technical sense of the word. When the chapter assembled, Francis, no doubt from a genuine feeling that he was not able to govern a great world-wide order, practically abdicated the post of minister-general by appointing a vicar, and the policy of turning the Friars Minor into a great religious order was consistently pursued, especially by Elias, who a year later became Francis's vicar (*see FRANCIS OF ASSISI; ELIAS OF CORTONA*).

On Francis's death in 1226 the government of the order rested in the hands of Elias until the chapter of 1227. At this chapter Elias was not elected minister-general; the building of the great basilica and monastery at Assisi was so manifest a violation of St. Francis's ideas and precepts that it produced a reaction, and John Parenti became St. Francis's first successor. He held fast to St.

Francis's ideas, but was not a strong man. At the chapter of 1230 a discussion arose concerning the binding force of St. Francis's Testament, and the interpretation of certain portions of the Rule, especially concerning poverty, and it was determined to submit the questions to Pope Gregory IX. (formerly the cardinal Hugolino mentioned above). He issued a bull, *Quo elongati*, which declared that as the Testament had not received the sanction of the general chapter it was not binding on the order, and also allowed trustees to hold and administer money for the order.

Wealth.—John Parenti and those who wished to maintain St. Francis's institute intact were greatly disturbed by these relaxations; but a majority of the chapter of 1232, by a sort of *coup d'état*, proclaimed Elias minister-general, and John retired, though in those days the office was for life. Under Elias the order entered on a period of extraordinary extension and prosperity: the number of friars in all parts of the world increased wonderfully, new provinces were formed, new missions to the heathen organized, the Franciscans entered the universities and vied with the Dominicans as teachers of theology and canon law, and as a body they became influential in church and state. With all this side of Elias's policy the great bulk of the order sympathized; but his rule was despotic and tyrannical and his private life was lax—at least according to any Franciscan standard, for no charge of grave irregularity was ever brought against him. And so a widespread movement against his government arose, the backbone of which was the university element at Paris and Oxford, and at a dramatic scene in a chapter held in the presence of Gregory IX. Elias was deposed (1239).

At this time the Franciscans were divided into three parties: there were the Zealots, or Spirituals, who called for a literal observance of St. Francis's Rule and Testament. They deplored all the developments since 1219, and protested against turning the institute into an order, the frequentation of the universities and the pursuit of learning; in a word, they wished to restore the life to what it had been during the first few years—the hermitages and the huts of twigs, and the care of the lepers and the nomadic preaching. The Zealots were few in number but of great consequence from the fact that to them belonged most of the first disciples and the most intimate companions of St. Francis. At the other extreme was a party of relaxation, that abandoned any serious effort to practise Franciscan poverty and simplicity of life. Between these two stood the great middle party of Moderates, who desired indeed that the Franciscans should be really poor and simple in their manner of life, and really pious, but on the other hand approved of the development of the order on the lines of other orders, of the acquisition of influence, of the cultivation of theology and other sciences, and of the frequenting of the universities.

Moderates and Spirituals.—The Moderate party was by far the largest, and embraced nearly all the friars of France, England and Germany. It was the Moderates and not the Zealots that brought about Elias's deposition, and the next general ministers belonged to this party. Further relaxations of the law of poverty, however, caused a reaction, and John of Parma, one of the Zealots, became minister-general, 1247–1257. Under him the more extreme of the Zealots took up and exaggerated the theories of the Eternal Gospel of the Calabrian Cistercian abbot Joachim of Floris (*q.v.*); some of their writings were condemned as heretical, and John of Parma, who was implicated in these apocalyptic tendencies, had to resign. He was succeeded by St. Bonaventura (1257–1274), one of the best type of the middle party. He was a man of high character, a theologian, a mystic, a holy man and a strong ruler. He set himself with determination to effect a working compromise, and proceeded with firmness against the extremists on both sides. But controversy and recrimination and persecution had stiffened the more ardent among the Zealots into obstinate fanatics—some of them threw themselves into a movement that may best be briefly described as a recrudescence of Montanism (*see* Émile Gebhart's *Italie mystique*, 1899, cc. v. and vi.), and developed into a number of sects, some on the fringe of Catholic Christianity and others beyond its pale (*see* FRATICELLI). But the majority of the Zealot party,

or Spirituals, did not go so far, and adopted as the principle of Franciscan poverty the formula "a poor and scanty use" (*usus pauper et tenuis*) of earthly goods, as opposed to the "moderate use" advocated by the less strict party.

The question thus posed came before the Council of Vienne, 1312, and was determined, on the whole, decidedly in favour of the stricter view. Some of the French Zealots were not satisfied and formed a semi-schismatical body in Provence; twenty-five of them were tried before the Inquisition, and four were burned alive at Marseilles as obstinate heretics, 1318. After this the schism in the Order subsided. But the disintegrating forces produced by the papal schism and other disorders of the 14th century caused among the Franciscans the same relaxations and corruptions, and also the same reactions and reform movements, as among the other orders.

The chief of these reforms was that of the Observants, which began at Foligno about 1370. The Observant reform was on the basis of the "poor and scanty use" of worldly goods, but it was organized as an order and its members freely pursued theological studies; thus it did not represent the position of the original Zealot party, nor was it the continuation of it. The Observant reform spread widely throughout Italy and into France, Spain and Germany. The great promoters of the movement were St. Bernardine of Siena and St. John Capistran. The council of Constance, 1415, allowed the French Observant friars to be ruled by a vicar of their own, under the minister-general, and the same privilege was soon accorded to other countries. By the end of the middle ages the Observants had some 1,400 houses divided into 50 provinces. This movement produced a "half-reform" among the Conventuals or friars of the mitigated observance; it also called forth a number of lesser imitations or congregations of strict observance.

Division.—After many attempts had been made to bring about a working union among the many observances, in 1517 Leo X. divided the Franciscan order into two distinct and independent bodies, each with its own minister-general, its own provinces and provincials and its own general chapter: (1) The Conventuals, who were authorized to use the various papal dispensations in regard to the observance of poverty, and were allowed to possess property and fixed income, corporately, like the monastic orders: (2) The Observants, who were bound to as close an observance of St. Francis's Rule in regard to poverty and all else as was practically possible.

At this time a great number of the Conventuals went over to the Observants, who have ever since been by far the more numerous and influential branch of the order. Among the Observants in the course of the sixteenth century arose various reforms, each striving to approach more and more nearly to St. Francis's ideal; the chief of these reforms were the Alcantarines in Spain (St. Peter of Alcantara, St. Teresa's friend, d. 1562), the Riformati in Italy and the Recollects in France: all of these were semi-independent congregations. The Capuchins (*q.v.*), established c. 1525, who claim to be the reform which approaches nearest in its conception to the original type, became a distinct order of Franciscans in 1619. Finally Leo XIII. grouped the Franciscans into three bodies or orders—the Conventuals; the Observants, embracing all branches of the strict observance, except the Capuchins; and the Capuchins—which together constitute the "First Order." For the "Second Order," or the nuns, see CLARA, ST., and CLARES, POOR; and for the "Third Order" see TERTIARIES. Many of the Tertiaries live a fully monastic life in community under the usual vows, and are formed into Congregations of Regular Tertiaries, both men and women. They have been and are still very numerous, and give themselves up to education, to the care of the sick and of orphans and to good works of all kinds.

No order has had so stormy an internal history as the Franciscans; yet in spite of all the troubles and dissensions and strivings that have marred Franciscan history, the Friars Minor of every kind have in each age faithfully and zealously carried on St. Francis's great work of ministering to the spiritual needs of the poor. Always recruited in large measure from among the

poor, they have ever been the order of the poor, and in their preaching and missions and ministrations they have ever laid themselves out to meet the needs of the poor. Another great work of the Franciscans throughout the whole course of their history has been their missions to the Mohammedans, both in western Asia and in North Africa, and to the heathens in China, Japan and India, and North and South America; a great number of the friars were martyred. The news of the martyrdom of five of his friars in Morocco was one of the joys of St. Francis's closing years. Many of these missions exist to this day. In the universities, too, the Franciscans made themselves felt alongside of the Dominicans, and created a rival school of theology, wherein, as contrasted with Dominican Aristotelianism, the Platonism of the early Christian doctors has been perpetuated.

The Franciscans came to England in 1224 and immediately made foundations in Canterbury, London and Oxford (for lists see Gasquet, *English Monastic Life*). Though nearly all the English houses belonged to what has been called the "middle party," as a matter of fact they practised great poverty, and the commissioners of Henry VIII. often remark that the Franciscan Friary was the poorest of the religious houses of a town. The English province was one of the most remarkable in the order, especially in intellectual achievement; it produced Friar Roger Bacon, and, with the single exception of St. Bonaventure, all the greatest doctors of the Franciscan theological school—Alexander Hales, Duns Scotus and Occam.

The Franciscans have always been the most numerous by far of the religious orders; it is estimated that about the period of the Reformation the Friars Minor must have numbered nearly 100,000. At the present day the statistics are roughly (including lay-brothers): Observants, 17,000, Conventuals, 2,400; to these should be added 16,000 Capuchins, making the total number of Franciscan friars about 35,000. There are various houses of Observants and Capuchins in England and Ireland; and the old Irish Conventuals survived the penal times and still exist.

BIBLIOGRAPHY.—The great source for Franciscan history is Wadding's *Annales*; it has been many times continued, and now extends in 25 vols. fol. to the year 1622. The story is also told by Helyot, *Hist. des ordres religieux* (1714), vol. vii. Abridgments, with references to recent literature, will be found in Max Heimbucher, *Orden und Kongregationen* (1896), i. §§ 37-51; in Wetzer and Welte, *Kirchenlexicon* (2nd ed.), articles "Armut (III.)," "Franciscaner orden" (this article contains the best account of the inner history and the polity of the order up to 1886); in Herzog-Hauck, *Realencyclopädie* (3rd ed.), articles "Franz von Assisi" (fullest references to literature up to 1899), "Fratricellen"; articles "Francis, Saint" and kindred topics in the *Catholic Encyclopedia*. Of modern critical studies on Franciscan origins, K. Müller's *Anfänge des Minoritenordens und der Bussbruderschaften* (1885), and various articles by F. Ehrle in *Archiv für Literatur- und Kirchengeschichte des Mittelalters* and *Zeitschrift für Katholische Theologie*, deserve special mention. Eccleston's charming chronicle of "The Coming of the Friars Minor into England" has been translated into English by the Capuchin Fr. Cuthbert, who has prefixed an Introductory Essay giving by far the best account in English of "the Spirit and Genius of the Franciscan Friars" (*The Friars and how they came to England*, 1903). A complete account of Franciscan history was produced in 1909 in German and Latin by H. Holzapfel, a Friar Minor. Fuller information on the English Franciscans will be found in A. G. Little's *Grey Friars in Oxford* (Oxford Hist. Soc., 1892); N. Davis, *The Old Missions of California* (1926); F. Palou, *Historical Memoirs of New California* (1926); T. P. O'Rourke, *The Franciscan Missions in Texas* (1927); and Henry Thode, *Franz von Assisi und die Anfänge der Kunst der Renaissance in Italien* (2 vols., 1904). (E. C. B.)

FRANCIS FERDINAND (1863-1914), archduke of Austria, was born at Graz on Dec. 18, 1863. The eldest son of the Archduke Charles Louis and a nephew of the Emperor Francis Joseph, he became, after the death of the Crown Prince Rudolph, the heir to the Austro-Hungarian monarchy. In 1875 he took the title of archduke of Austria-Este, as heir to his uncle the duke of Modena, with whose death the male line of this branch of the house became extinct, and to his possessions in Austria-Hungary and Italy.

Until the death on Jan. 30, 1889, of the Crown Prince Rudolph, Francis Ferdinand was only known in limited circles and even then he was not invited by the Emperor Francis Joseph to take part in State affairs. On July 1, 1900, he married Countess Sophie

Chotek (1868-1914), after having overcome, by tenacious persistence, the obstacle due to the fact that the lady was not of royal family, and renounced a few days before the ceremony the succession rights of any children of the union. This renunciation was not only inscribed in the records of the imperial family, but ratified in the Austrian and Hungarian parliaments and sanctioned by a law of Dec. 4, 1900.

After that time the emperor gradually allotted to him responsibilities of his own, not only in military matters but occasionally in questions of domestic politics. The difference of outlook of the two men, however, became more and more marked; for with advancing age Francis Joseph was less and less willing to consider far-reaching reforms and was anxious to avoid any conflict with the nationalities. Francis Ferdinand was convinced that the Magyar preponderance in the affairs of the dual monarchy must be broken in the interests of the monarchy and the dynasty. For some time he held that Federalism was the best solution. At another period he inclined to "Trialism." Later, influenced by the Hungarian minister Kristoffy, he inclined to strengthen unity by changing the Delegations into a central parliament and attaching the annexed provinces Bosnia and Hercegovina, with a State organization of their own, to the empire. The opposition which he met on all sides from the ruling party in Hungary strengthened his conviction that here lay the essential obstacle to the healthy recovery of the monarchy. In the severe conflicts between the Magyars and the Crown from the beginning of the 20th century onwards he, therefore, maintained the opinion that no concession must be made, and that there should be no shrinking even from the use of armed force for the defence of the rights of the monarchy and the dynasty.

The zeal with which he sought the solution of domestic political problems by strengthening the central power is explained by his firm conviction that this was the indispensable condition of the monarchy as a Great Power, which he desired to maintain and to increase. He considered that friendly relations with Great Britain were desirable, but towards France, and still more towards Italy, his attitude was cool and negative. He was convinced that there must inevitably be a day of reckoning between the monarchy and Italy. He never adopted an anti-Slav policy. He wished to avoid conflicts with the principal representatives of the Slav nationalities, and recognized in the tsar of Russia the strongest support against revolutionary movements in monarchical States. At the same time he expressed the decided opinion that the encroachments of the Greater Serbia movement on Austro-Hungarian soil should be resisted with all the forces of the monarchy. He stood by Germany, yet was determined that the monarchy should not fall into dependence on her powerful ally.

Francis Ferdinand was a man of more than average ability. He would immediately recognize the essential point in any business in which he was engaged. What he lacked was knowledge of men and calmness and constancy in his relations with the men who had been placed in high offices of State by his influence. He asked from the citizens of the monarchy not affection, but submission to the will of the ruler. To him the State was identified with the divinely appointed person of the monarch. He was shot on June 28, 1914, with his wife, by Bosnians of Serbian nationality at Serajevo. (See EUROPE.)

BIBLIOGRAPHY.—Some account of Francis Ferdinand's life is contained in his *Tagebuch meiner Reise um die Erde* (Vienna, 1895); T. von Sosnosky, "Franz Ferdinand," in *Deutsches Biographisches Jahrbuch* (1916); F. Erinnerungen an Erzherzog Franz Ferdinand* (1925).

FRANCIS JOSEPH I. (1830-1916), emperor of Austria and king of Hungary, was born on Aug. 18, 1830, eldest son of the archduke Francis Charles, second son of the reigning emperor Francis I., and Sophia, daughter of Maximilian I., king of Bavaria. Francis Joseph was educated in a severe and clerical atmosphere, his preceptors including Metternich himself. On the outbreak of the revolution of 1848 he served in Italy, under Radetzky; and

when the revolution was crushed, as the leaders of the reaction, Schwarzenberg and Windischgrätz, wished to start afresh with a monarch not compromised by any concessions or promises to the revolutionaries, Ferdinand was persuaded to abdicate in favour of his nephew (Dec. 2, 1848). During the first years of his reign (for details see AUSTRIA) Francis Joseph was wholly under the influence of Schwarzenberg, his mother, and his tutor, Cardinal Rauscher. His rule began un auspiciously with the suppression of liberty in Germany, in Italy and in Hungary, where Russian help was called in to crush the Magyars. Even in Austria, the parliament of Kremsier was suppressed, and on Dec. 31, 1851, the young sovereign revoked the constitution which he himself had enacted two years previously to establish a centralist absolutism in which the monarch assumed the entire weight and responsibility of government. After Schwarzenberg's death (April 1852), Francis Joseph appointed no successor, but acted as his own Minister President. His conscientious diligence was untiring, and this period of his reign, for all its lack of liberty, did not lack wise administrative reforms. Unfortunately, in his youth even more than his age, Francis Joseph was convinced both of the impossibility and the impiety of constitutional methods. While leaving his bureaucracy to control a docile people, he embarked himself on an ambitious foreign policy. The army was increased; and his natural piety heightened by his escape from an assassin's knife in 1853, and combined with visions of a revival of the old Holy Roman Empire, found vent in the conclusion of the Concordat of 1855. Francis Joseph dreamed of a brilliant autocracy, resting on the church and the sword; but the foreign ventures of his early years was as unlucky as they were ambitious. His vacillating policy in the Crimean War left Austria isolated, and earned him the personal antagonism of the Tsar; the war of 1859 ended ill; his most brilliant plan of all, the convocation of a *Fürstentag* in Frankfurt, under his own presidency, to discuss German affairs, was frustrated by the shrewdness of Bismarck in preventing the king of Prussia from attending. The hegemony in Germany passed definitively to Prussia at the end of the Seven Weeks War of 1866.

These 18 years of misfortune constitute the first period of Francis Joseph's career—the period of hope, ambition and self-confidence at home and abroad. During this period he might have justly been called a militarist; acts of repression and severity amounting to cruelty were perpetrated in his name, and the responsibility for them must lie with him, since he claimed the right to autocracy. Hitherto, also, he had believed in his ability (he always believed in his right) to enforce an absolute system, and to be sole judge of his peoples' welfare. But the consistent failure of his ambitions, involving Austria, as it did, in a disastrous financial crisis, compelled him to come to terms with his subjects, first and foremost the Magyars, but also the Poles, Czechs and Germans. With the plainest reluctance and opposition, he was forced step by step into the path of constitutionalism. Francis Joseph's inner resistance to this necessity was manifested in the impatience and instability of his decisions. He was still far from the idea of letting the *people* govern; the idea of sharing responsibility with the centralizing German bureaucracy alternated in his mind with that of concessions to the politically less desirable, but socially intelligible Magyar magnates. As each in turn disappointed him, and seemed intolerably distasteful, he flew to the extreme of the other; so that all the period 1859-67 was marked by extraordinary vacillations which revealed another of the Emperor's weaknesses; he never trusted his ministers fully or for long, and looking on the most faithful of them only as servants and instruments, he threw them aside without a second thought when he was done with them.

The years 1866-67 formed the turning-point in Francis Joseph's life. He had been forced to accept the constitutional principle, had come to terms with the Magyars, in token of which he was at last crowned king in Hungary, and to admit definitively a constitutional regime in Austria. The period of adventure was over at home, and to a large extent abroad, for if up to 1870 he dreamed of revenge on Prussia, the decisive step was never taken, and after the foundation of the German Empire, Francis

Joseph accommodated himself—joylessly but without resistance—to his diminished rôle in the west. In his private life, too, a period was closed. His marriage (April 24, 1854) with the beautiful Elizabeth of Wittelsbach had been a true love-match; but the couple soon became estranged, partly owing to the Emperor's fault, and partly to his mother's intrigues. His brother Maximilian perished in Mexico in 1867; his only son Rudolph was no joy to him.

His word once pledged to Constitutionalism, Francis Joseph stood by it. In his heart he probably always looked on the Magyars as rebels; but he was socially sympathetic to their magnates, and held loyally by the compromise of 1867; the prolonged crisis of 1903 on was caused by Magyar endeavours to alter the basis of the compromise, particularly of that prerogative to which Francis Joseph held above all others—his undisputed control over the army. His natural sympathies were for the German race; but the leading German party was that of the Liberals—middle-class, anti-clerical and opposed to military expenditure—while the Slav districts were the stronghold of the feudal magnates. So Francis Joseph stood above party, at heart unsympathetic to all, and playing off one against the other with a sole eye to the integrity of the monarchy. So far did his indifference to parliamentarism go, that he was actually largely instrumental in the introduction of general suffrage into Austria, as a last attempt to play off a new factor against all the unsatisfactory parties alike.

His foreign policy became increasingly pacific. He did, indeed, seek some compensation for his early losses in the occupation, and later annexation, of Bosnia and the Hercegovina; but these measures, especially the latter, were far more defensive than is generally admitted. His personal influence was always on the side of peace, and although deeply shocked by the murder of the Archduke, he would probably have found some means of averting war with Serbia in 1914, had the conduct of foreign policy not slipped from his hands with advancing age. War once declared, he remained wholly loyal to his German ally, although he would gladly have seen peace restored. For his illusions regarding successful war were gone; and he declared now that Austria "would be lucky if she got off with a black eye."

His disillusionment was due in part to the unceasing bickering of his subjects, in part to the increasing loneliness of his private life; for his wife was assassinated in 1897, his son Rudolph (*q.v.*) committed suicide in 1889, his nephew and heir, Francis Ferdinand (*q.v.*), was unsympathetic to him. In his old age he consorted with few persons except his lifelong friend, Katharine Schratz, and his young grandchildren. The hostility between him and his subjects (to whose welfare he was always devoted) had vanished; but their reverence for him was too remote to become active affection.

Francis Joseph's invariable reserve, due partly to his consciousness of his exalted position, was such that character-sketches or even anecdotes of him are rare. In his old age his character softened; and he was always courteous, conscientious, industrious, and above all dignified. He had a prodigious memory and experience, but an intellect not above the average, and a cold and somewhat ungenial nature, with no taste for the arts. His only passion was the chase. His great failing as a ruler was his distrust of ability. Two of his phrases are illuminating: to the citizens of Frankfurt, in 1866, he said: "I have an unlucky hand"; and to the Field Marshal Conrad, at the end of his life: "Believe me, this realm cannot be ruled constitutionally." He died peacefully on Nov. 21, 1916.

FRANCIS OF ASSISI, ST. (1181/82–1226), founder of the Franciscans (*q.v.*), was born at Assisi, his father, Pietro Bernardone, being one of the larger merchants. His education appears to have been of the slightest, even for those days, and it is diffi-

cult to decide whether the early biographers imply that his youth was not free from irregularities. In any case, he was the recognized leader of the young men of the town in their revels, though he was always conspicuous for his charity to the poor.

After a serious illness in 1202 during which he became dissatisfied with his way of life, he set out on a military expedition, but at the end of the first day fell ill, and had to return to Assisi. This disappointment brought on again the spiritual crisis experienced in his illness. One day he gave a banquet to his friends, and after it they sallied forth through the streets, Francis being crowned as the king of the revellers; after a time they missed him, and on retracing their steps they found him in a trance, a permanently altered man. He devoted himself to solitude, prayer and the service of the poor, and before long went on a pilgrimage to Rome. The determining episode of his life followed soon after his return to Assisi. Having a special horror of lepers, he passed by a begging leper; but immediately an heroic act of self-conquest made him return, give the leper his money, and kiss his hand. From that day he gave himself to the service of the lepers and the hospitals. In consequence of his profuse alms to the poor and to the restoration of the church of St. Damian, his father fearing the dissipation of his property took Francis before the bishop of Assisi to have him legally disinherited; but without waiting for the documents to be drawn up, Francis cast off his clothes and having received a cloak from the bishop, went off to the woods of Mount Subasio.

The next three years he spent in abject poverty, ministering to lepers and outcasts. He began to frequent the ruined little chapel of St. Mary of the Angels, known as the Portiuncula, and one day during Mass, the words of the Gospel came to him as a call: "Everywhere on your road preach and say—The kingdom of God is at hand. Cure the sick, raise the dead, cleanse the lepers, drive out devils. Freely have you received, freely give. Carry neither gold nor silver nor money in your girdles, nor bag, nor two coats, nor sandals, nor staff, for the workman is worthy of his hire" (Matt. x. 7–10). Layman as he was, he went up to Assisi to preach to the poor (1209). Disciples joined him, and when they were twelve in number they obtained the sanction of Innocent III., and gave themselves up to apostolic preaching and work among the poor.

The character and development of the order are traced in the article FRANCISCANS; here the story of Francis will be attempted. To delineate his character in a few words is a difficult task. There is such a many-sided richness, such a tenderness, such a poetry, such an originality, such a distinction revealed by the innumerable anecdotes in the memoirs of his disciples, that his personality is brought home to us as one of the most lovable and one of the strongest of men. Probably no one has ever set himself so seriously to imitate the life of Christ and to carry out so literally Christ's work in Christ's own way. His enthusiastic love of poverty is certainly the keynote of St. Francis's spirit; hence one of his disciples in an allegorical poem (Eng. trans. as *The Lady of Poverty* by Montgomery Carmichael, 1901), and Giotto in one of the frescoes at Assisi, celebrated the "holy nuptials of Francis with Lady Poverty."

Another striking feature was his constant joyousness, a precept in his rule, and one that he enforced strictly. His love of nature, animate and inanimate, was keen and manifested itself in ways that appear somewhat naïve. His preaching to the birds is a favourite theme in art. All creatures he called his "brothers" or "sisters" and in the poem, "Praises of the Creatures," calls on "brother Sun," "sister Moon," "brother Wind," and "sister Water" to praise God. In his last illness he was cauterized, and on seeing the burning iron he addressed "brother Fire," reminding him how he had always loved him and asking him to deal kindly with him. It would be an anachronism to think of Francis as a philanthropist or a "social worker" or a revivalist preacher, though he fulfilled the best functions of all these. Before everything he was an ascetic and a mystic—an ascetic who, though gentle to others, wore out his body by self-denial, so much so that when he came to die he begged pardon of "brother Ass the body" for having unduly ill-treated it. He was a mystic irradiated with the

love of God, and endowed in an extraordinary degree with the spirit of prayer.

The effect of the preaching of the friars, and their example and their work among the poor, was a great religious revival throughout Umbria and many new members for the order. In 1212 Francis invested St. Clara (*q.v.*) with the Franciscan habit, and so instituted the "Second Order," that of the nuns. As the friars became more numerous their labours extended to other countries. Francis himself set out, probably in 1212, for the Holy Land, but he was shipwrecked and had to return. A year or two later he went to the Moors in Spain, but had again to return without accomplishing his object. In 1219, he went to Egypt, where the crusaders were besieging Damietta, and on being taken prisoner was led before the sultan, to whom he preached the Gospel. The sultan sent him back to the Christian camp, and he passed on to the Holy Land where he remained until Sept. 1220. During his absence the troubles in the order that were to attain to such magnitude after his death began. The circumstances under which, at an extraordinary general chapter, he resigned the office of minister-general (Sept. 1220) are explained in the article FRANCISCANS: here, as illustrating the spirit of the man, it is in place to cite the words of his abdication: "Lord, I give Thee back this family which Thou didst entrust to me. Thou knowest, most sweet Jesus, that I have no more the power and the qualities to continue to take care of it. I entrust it, therefore, to the ministers. Let them be responsible before Thee at the Day of Judgment, if any brother by their negligence, or their bad example, or by a too severe punishment, shall go astray." These words seem to contain the mere truth: Francis's peculiar religious genius was probably not adapted for the government of an enormous society.

The chief works of the next years were the revision and final redaction of the Rule and the formation of the "Third Order" "Brothers and Sisters of Penance," a vast lay confraternity trying to carry out, without withdrawing from the world, the fundamental principles of Franciscan life (see TERTIARIES).

If for no other reason than the prominent place they hold in art, the Stigmata must be mentioned. Two years before his death Francis went up Mount Alverno in the Apennines with some of his disciples, and after forty days of fasting and prayer and contemplation, on Sept. 14, 1224 (to use Sabatier's words), "he had a vision: in the warm rays of the rising sun he discerned suddenly a strange figure. A seraph with wings extended flew towards him from the horizon and inundated him with pleasure unutterable. At the centre of the vision appeared a cross, and the seraph was nailed to it. When the vision disappeared Francis felt sharp pains mingling with the delights of the first moment. Disturbed to the centre of his being he anxiously sought the meaning of it all, and then he saw on his body the Stigmata of the Crucified." The early authorities represent the Stigmata not as bleeding wounds, but as fleshy excrescences resembling the nails. In the first edition of the *Vie*, Sabatier rejected the Stigmata; but in the later editions he accepts their objective reality as historically established and gives the evidence. There exists what is most probably an autograph of Br. Leo, the saint's favourite disciple and companion on Mount Alverno at the time, which describes the circumstances of the stigmatization. Elias of Cortona (*q.v.*), the acting superior, wrote on the day after his death a circular letter wherein he clearly implies that he himself had seen the Stigmata. There is also much contemporary second hand evidence.

Francis was so exhausted by the sojourn on Mount Alverno that he had to be carried back to Assisi. His remaining months were passed in great bodily suffering, and though he became almost blind, he worked on with joyousness. He died in the Portiuncula on Oct. 3, 1226. Two years later he was canonized by Gregory IX., whom, as Cardinal Hugolino of Ostia, he had chosen as protector of his order.

The works of St. Francis consisting of the Rule (in two redactions), the Testament, spiritual admonitions, canticles and a few letters were first edited by Wadding (Antwerp 1623). In 1904 critical editions were published by the Franciscans of Quaracchi (near Florence) and by H. Boehmer of Bonn. (Eng. trs. Philadelphia 1906 and London 1907.) Besides the works, there is a

considerable amount of traditional matter— anecdotes, sayings, sermons—preserved in the biographies and in the *Fioretti* (ed. Sabatier, 1902. Eng. trs. in Everyman's Library, 1910).

Of the numerous sources for the life of St. Francis and early Franciscan history the chief materials are in the following collections: *Archiv für Literatur und Kirchengeschichte des Mittelalters* (ed. Ehrle and Denifle, 1885, etc.); publications of the Franciscans of Quaracchi (list to be obtained from Herder, Freiburg im Breisgau); and Sabatier, *Collection d'études et de documents sur l'histoire religieuse et littéraire du moyen âge* (5 vols. 1898 fol.) and *Opusculs de critique historique* (12 fascicules): the easiest and most consecutive way of following the controversy is by the aid of the "Bulletin Hagiographique" in *Analecta Bollandiana*. Popular accounts of the sources are given in Sabatier's *Vie de S. François* and *Speculum perfectionis*, and Lempp's *Frère Élie de Cortone*.

Concerning the life of St. Francis and the beginnings of the order, the chief documents are: the two *Lives* by Thomas of Celano (1228 and 1248 respectively; Eng. trans. A. G. Ferrers Howell, 1908), critical edition by Ed. d'Alençon 1906 and the Quaracchi Franciscans (1926); the so-called *Legenda trium sociorum* (ed. Foligno 1898, Eng. trans. by G. Gurney Salter, 1902); the *Speculum perfectionis*, discovered by Sabatier and edited in 1898 (Eng. trans. by De la Warr 1902, and in Everyman's Library, 1910). Sabatier contended that the *Speculum perfectionis* was the first of all the Lives of the saint, written in 1227 by Br. Leo, his favourite disciple, and that the *Legenda 3 Soc.* was the handiwork of Leo and the two other intimate companions of Francis, compiled in 1246; these are the most authentic accounts, Celano's Lives being written in opposition and in the interests of those who favoured mitigations of the Rule. The whole ground was reviewed by W. Goetz in *Die Quellen zur Geschichte des hl. Franz von Assisi* (1904). His conclusions are substantially those of van Ortroy, the Bollandist, and Friar Lemmens, and the direct contrary of Sabatier's: the *Legenda 3 Soc.* is a forgery; the *Speculum perfectionis* is a compilation of the 14th century, also largely a forgery, but containing an element derived from Br. Leo; on the other hand, Celano's two Lives are free from the "tendencies" ascribed to them by Sabatier, and that of 1248 was written with the collaboration of Leo and the other companions. Thus the best sources are those portions of the *Speculum* that can with certainty be carried back to Br. Leo, and the Lives by Thomas of Celano, especially the second *Life*. The official life of St. Francis is St. Bonaventura's *Legenda*, published by the Franciscans of Quaracchi (1898), Eng. trs. in Everyman's Library (1910).

Sabatier's fascinating and in many ways sympathetic *Vie de S. François* (1893; 33rd ed., 1906; Eng. trans. by L. S. Houghton, 1901) seems to depict St. Francis too much from the standpoint of modern religiosity, and has exaggerated his attitude to the church. In articles in the *Hist. Vierteljahrsschrift* (1902, 1903) Goetz has shown that Sabatier's presentation of St. Francis's relations with the ecclesiastical authority in general, and with Cardinal Hugolino (Gregory IX.) in particular, is misconceived; that the development of the order was not forced on Francis against his will; and that the differences in the order did not during Francis's lifetime attain to such a magnitude as to cause him the suffering depicted by Sabatier. This from a Protestant historian like Goetz is most valuable criticism. In truth Sabatier's St. Francis as a modern pietistic French Protestant of the most liberal type, with a veneer of 13th century Catholicism, is an anachronism.

FRANCIS OF PAOLA (or PAULA), ST. (c. 1416-1507), founder of the Minims, one of the Mendicant orders of the Roman Catholic Church, was born of humble parentage at Paola in Calabria. He entered a Franciscan friary, but left it to live as a hermit. Soon disciples joined him, and with the bishop's

approval he built a church and monastery. They proposed to go beyond even the strict Franciscans in fasts and bodily austerities, in poverty and in humility; and therefore, as the Franciscans were the Minors (*minores*, less), the new order took the name of Minims (*minimi*, least). By 1474 the order was approved by the pope. In 1482 Louis XI. of France, being on his deathbed sent for Francis to attend him. Louis' successor, Charles VIII., held him in such high esteem that he kept him in Paris, and enabled him to found various houses of his order. He died in the monastery at Plessis-les-Tours, and his feast is celebrated on April 2nd.

The Rule was so strict that it was not finally sanctioned until 1506. It enjoins perpetual abstinence, even from such animal products as eggs, milk, butter, cheese. The strongly ascetical spirit of the Minims manifested itself in the title borne by the superiors—not abbot (father), or prior, or guardian, or minister, or rector, but corrector. At the death of the founder, the order had five provinces—Italy, France, Tours, Germany, Spain.

FRANCIS (FRANÇOIS) OF SALES, ST. (1567–1622), noted bishop of Geneva and doctor of the Church, was born in Aug. 1567 at the castle of Sales, near Annecy, Savoy. He studied at the Jesuit College of Clermont at Paris and then at Padua, where in 1588 he took his degree in law. He returned to Savoy in 1592, and took the diploma of advocate to the senate. He was then made provost of the chapter of Geneva, and a year later, was sent by the bishop, Claude de Granier, to win back the province of Chablais, which had embraced Calvinism in 1535. By 1598 the whole country was Catholic again. In Oct. of this year, Duke Charles Emmanuel of Savoy, who participated in the celebrations of the return of the country to the faith, expatriated such of the leading men as obstinately refused even to listen to the Catholic arguments. He also forbade Calvinist ministers to reside in the Chablais, and substituted Catholic for Huguenot officials. St. Francis concurred in these measures, and, three years later, even requested that those who, as he said, "follow their heresy, rather as a party than a religion," should be ordered either to conform or to leave their country, with leave to sell their goods. At this time Francis was nominated to the pope as coadjutor of Geneva, with the title of Nicopolis *in partibus*, and after a visit to Rome he assisted Bishop de Granier in the administration of the newly converted countries.

In 1602 he re-visited Paris where he came into the closest relations with the court of Henry IV. In Sept. of the same year he succeeded De Granier as bishop. With Jeanne Françoise Frémyot (1572–1641), widow of the baron de Chantal, he founded the order of the Visitation, in favour of "strong souls with weak bodies," as he said, deterred from entering other orders because of physical weakness. In 1618 he again went to Paris to assist in negotiating the marriage of the prince of Piedmont with Chrétienne of France, but nearly all his time was spent in preaching and works of mercy, spiritual or corporal. St. Vincent has given the most extraordinary testimonies (as yet unpublished) of his heroic virtues, and Mère Angélique Arnaud put herself under his direction and wished to join the Order of the Visitation. He returned to Savoy, and after three years of unwearying labour died at Lyons on Dec. 28, 1622. He was canonized in 1665.

The first edition of his complete works was published at Toulouse in 1637. A critical edition was published by the Visitation of Annecy (21 vols., 1892). There are Eng. translations of various selections of his works, of the *Spiritual Conferences* (1868) and of the *Introduction to the Devout Life* (1924).

A biography of St. Francis de Sales was produced immediately after his death by the celebrated P. de La Rivière and Dom John de St. François (Goulu), and another by his nephew, Charles Auguste de Sales, in 1635 (reprinted Paris, 1866). M. Hamon's *Vie de S. François* (1856, 7th ed., 1922) has been adapted by H. Burton as *The Life of St. Francis de Sales* (1925). See also H. B. Mackey, *Four Essays on St. Francis de Sales* (1883); A. Delplanque, *S. François de Sales, Humaniste et Écrivain* (Lille, 1907); and article in Herzog-Hauck, *Realencyklopädie*.

FRANCIS OF MAYRONE (d. c. 1326), scholastic philosopher, was born at Mayrone, Provence. He joined the Franciscans

and subsequently went to Paris, where he was a pupil of Duns Scotus. At the Sorbonne his teaching and ability in discussion gained him the title *Doctor Illuminatus*. He died at Piacenza c. 1326. Depreciating Aristotle, he developed the Platonic theory of ideas and declared that universals are prior in nature to individuals. His elaborate subtleties made him the real producer of the system known as Scotism. His numerous works include the *De Primo Principio*, *De univocatione entis*, *Quodlibeta*, and commentaries on the *Isagoge* of Porphyry, on the logical works and *Physics* of Aristotle, and on the *Sentences*. Partial collections appeared at Venice in 1517 and 1520.

FRANCK. The name of Franck has been given indiscriminately but improperly to painters of the school of Antwerp who belong to the families of Francken (*q.v.*) and of Vrancx. One artist truly entitled to be called Franck is Gabriel, who entered the gild of Antwerp in 1605, became its president in 1636 and died in 1639. But his works cannot now be traced.

FRANCK, CÉSAR (1822–1890), French musical composer, a Belgian by birth, who came of German stock, was born at Liège on Dec. 10, 1822. After some studies at Liège he came to Paris in 1837 and entered the conservatoire. His early compositions date from this period, and include four trios for piano and strings, besides several piano pieces. *Ruth*, a biblical cantata was produced with success at the conservatoire in 1846. An opera entitled *Le Valet de ferme* was written about this time, but has never been performed. For many years Franck led a retired life, devoting himself to teaching and to his duties as organist, first at Saint-Jean-Saint-François, then at Ste. Clotilde, where he acquired a great reputation as an improviser. He also wrote a mass, heard in 1861, and a quantity of motets, organ pieces and other works of a religious character.

Franck was appointed professor of the organ at the Paris conservatoire, in succession to Benoist, his old master, in 1872, and the next year he was naturalized a Frenchman. A revival of his early oratorio, *Ruth*, had brought his name again before the public, and this was followed by the production of *Rédemption*, a work for solo, chorus and orchestra, given under the direction of M. Colonne on the 10th of April 1873. The unconventionality of the music rather disconcerted the general public, but the work nevertheless made its mark. The following is a list of his subsequent compositions: *Rebecca* (1881), a biblical idyll for solo, chorus and orchestra; *Les Béatitudes*, an oratorio composed between 1870 and 1880, perhaps his greatest work; the symphonic poems, *Les Éolides* (1876), *Le Chasseur maudit* (1883), *Les Djinns* (1884), for piano and orchestra; *Psyche* (1888), for orchestra and chorus; symphonic variations for piano and orchestra (1885); symphony in D (1889); quintet for piano and strings (1880); sonata for piano and violin (1886); string quartet (1889); prelude, choral and fugue for piano (1884); prelude, aria and finale for piano (1889); various songs, notably "La Procession" and "Les Cloches du Soir." Franck also composed two four-act operas, *Hulda* and *Giselle*, both of which were produced at Monte Carlo after his death, which took place in Paris on the 8th of November 1890. The second of these was left by the master in an unfinished state, and the instrumentation was completed by several of his pupils.

César Franck's influence on his younger contemporaries was very great. An inspiring teacher, who by the simplicity and beauty of his own nature won the love and devotion of all who came in contact with him, he numbered among his own actual pupils D'Indy, Duparc, Chaussan, Ropartz, Pierné, de Bréville, Bordes and LeKeu. A more sincere, modest, self-respecting composer probably never existed. In the centre of the brilliant French capital he was able to lead a laborious existence consecrated to his threefold career of organist, teacher and composer. He never sought to gain the suffrages of the public by unworthy concessions, but kept straight on his path, ever mindful of an ideal to be reached and never swerving therefrom. A statue was erected to his memory in Paris on Oct. 22, 1904, the occasion producing a panegyric from Alfred Bruneau, in which he spoke of the composer's works as "cathedrals in sound."

Derepas, *César Franck* (1897); V. d'Indy, *César Franck* (1906, Eng. trans., 1910).

FRANCK or **FRANK** (latinized *FRANCUS*), **SEBASTIAN** (c. 1499-c. 1543), German freethinker, was born about 1499 at Donauwörth, whence he styled himself Franck von Wörd. He entered the university of Ingoldstadt (1515) and proceeded thence to the Dominican College, incorporated with the university, at Heidelberg. Having taken priest's orders, he held in 1524 a cure in the neighbourhood of Augsburg, but in 1525 went over to the Reformed party at Nuremberg and became preacher at Gustenfelden. His first work was a German translation with additions (1528) of the first part of the *Diallage*, or *Conciliatio locorum Scripturae*, directed against Sacramentarians and Anabaptists by Andrew Althamer, then deacon of St. Sebald's at Nuremberg. On March 17, 1528 he married Ottilie Beham, whose brothers, pupils of Albrecht Dürer, had got into trouble through Anabaptist leanings. In 1529 he produced a free version (*Klagbrief der armen Dürftigen in England*) of the famous *Supplicacyon of the Beggars*, of Simon Fish. In the autumn of 1529 he went to Strasbourg, and here began his intimacy with Caspar Schwenkfeld. Here, too, he published, in 1531, his most important work, the *Chronica, Zeitbuch und Geschichtsbibel*, largely a compilation on the basis of the Nuremberg Chronicle (1493). It is too much to call him "the first of German historians"; he is a forerunner of Gottfried Arnold, with more vigour and directness of purpose. Driven from Strasbourg by the authorities, after a short imprisonment in 1531, he tried to make a living as a soapboiler at Esslingen, removing in 1533 for a better market to Ulm, where (1534) he was admitted as a burgess.

His *Weltbuch*, a supplement to his *Chronica*, was printed at Tübingen in 1534; the publication, in the same year, of his *Paradoxa* at Ulm brought him into trouble with the authorities, and after the publication of his *Guldin Arch* (with pagan parallels to Christian sentiments) (Augsburg 1538) and *Germaniae chronicon* (Frankfort 1538) he had to leave Ulm (1539). At Basel he found work as a printer, and here, probably, he died in the winter of 1542-43. He had published in 1539 *Kriegbüchlein des Friedens* (pseudonymous), *Schriftliche und ganz gründliche Auslegung des 64 Psalms*, and *Das verbütschierte mit sieben Siegeln verschlossene Buch* (a biblical index, exhibiting the dissonance of Scripture); in 1541 his *Spruchwörter* (a collection of proverbs, several times reprinted with variations); in 1542 a new edition of his *Paradoxa*; and some smaller works.

Franck combined the humanist's passion for freedom with the mystic's devotion to the religion of the spirit. His breadth of human sympathy led him to positions which the comparative study of religions has made familiar, but for which his age was unprepared. Luther contemptuously dismissed him as a "devil's mouth." Pastor Frecht of Nuremberg pursued him with bitter zeal. In his last year, in a public Latin letter, he exhorted his friend John Campanus to maintain freedom of thought in face of the charge of heresy.

FRANCKE, AUGUST HERMANN (1663-1727), German Protestant divine, was born on Mar. 22, 1663, at Lübeck. He studied at Erfurt and at Kiel, where he came under the influence of the pietist Christian Kortholt (1633-94), then at Leipzig where he graduated and where, in 1685 he became a *Privatdocent*. A year later, by the help of his friend P. Anton, and with the approval and encouragement of P. J. Spener, he founded the Collegium Philobiblicum for the systematic study of the Bible, philologically and practically. Interdicted from preaching at Erfurt and Dresden, he found a place in the new university of Halle, first as professor of Greek and oriental languages, and then as professor of theology. Here he continued to teach and preach for the next 36 years, until his death on June 8, 1727, and Halle became a centre of pietism.

At Halle in 1695 he instituted what is often called a "ragged school," supported by public charity. In 1698 there were 100 orphans under his charge to be clothed and fed, besides 500 children who were taught as day scholars. The schools grew in importance and are still known as the *Francke'sche Stiftungen*.

See H. E. F. Guericke, *A. H. Francke* (1827 Eng. trs., 1837); A. Stein, *A. H. Francke* (3rd ed., 1894); Herzog-Hauck's *Realencyklopädie* (ed., 1899); Knuth, *Die Francke'schen Stiftungen* (2nd ed., 1903).

FRANCKE, MEISTER, German painter, active in Hamburg during the first half of the 15th century. His name occurs in a contract with the travellers to England, dated 1424, in which the artist undertakes to paint an altarpiece for a chapel in the church of St. John at Hamburg. Nine separate portions of this work are now in the museum at Hamburg. Two represent scenes from the life of Thomas of Canterbury, and seven scenes from the life of Christ, including a fragment of "the Crucifixion." Besides these, but few pictures can with certainty be ascribed to him. One of these is the "Christ as the Man of Sorrows" in the museum at Leipzig, an early work, and another is a later representation of the same subject in the museum at Hamburg. Meister Francke's style, though doubtless the product of the art of his time, is that of a strong personality; and all attempts to relate it to other schools have failed. With feeling for the decorative value of colour and for two dimensional design he combined a realistic rendering of detail and a somewhat exaggerated expression of emotions. To judge from numerous altarpieces in the north of Germany, which recall his style, his influence must have been widespread.

See A. Lichtwark, *Meister Francke* (Hamburg, 1899).

FRANCKEN. Eleven painters of this family cultivated their art in Antwerp during the 16th and 17th centuries. Several of these were related to each other, whilst many bore the same Christian name in succession. Hence unavoidable confusion in the subsequent classification of paintings not widely differing in style or execution. When Franz Francken the first found a rival in Franz Francken the second, he described himself as the "elder." In contradistinction to his son, who signed himself the "younger." But when Franz the second was threatened with competition from Franz the third, he took the name of "the elder," whilst Franz the third adopted that of Franz "the younger." It is possible, though not by any means easy, to sift the works of these artists. The eldest of the Franckens, Nicholas of Herenthals, died at Antwerp in 1596, but none of his works have survived.

Jerom Francken, the eldest son, after leaving his father's house, studied under Franz Floris. In 1566 he was one of the masters employed to decorate the palace of Fontainebleau, and in 1574 he obtained the appointment of court painter from Henry III., who had just returned from Poland and visited Titian at Venice. In 1603, when Van Mander wrote his biography of Flemish artists, Jerom Francken was still in Paris. Among his earliest works we should distinguish a "Nativity" in the Dresden museum, executed in co-operation with Franz Floris. Another of his important pieces is the "Abdication of Charles V." in the Amsterdam museum. Equally interesting is a "Portrait of a Falconer," dated 1558, in the Brunswick gallery.

Franz, the second son of Nicholas of Herenthals, is to be kept in memory as Franz Francken the first. He was born about 1544, matriculated at Antwerp in 1567, and died there in 1616. He, too, studied under Floris. Several of his pictures are in the museum of Antwerp; one dated 1597 in the Dresden museum represents "Christ on the Road to Golgotha," and is signed by him as D. 6 (Den ouden) F. Franck.

Ambrose, the third son of Nicholas of Herenthals, has bequeathed to us more specimens of his skill than Jerom or Franz the first. He first started as a partner with Jerom at Fontainebleau, then he returned to Antwerp, where he passed for his gild in 1573, and he lived at Antwerp till 1618. His best works are the "Miracle of the Loaves and Fishes" and the "Martyrdom of St. Crispin," both in the Antwerp museum.

Franz Francken the first trained three sons to his profession, the eldest of whom, though he practised as a master of gild at

Antwerp from 1600 to 1610, left no visible trace of his labours behind. Jerom the second took service with his uncle Ambrose. He was born in 1578, passed for his gild in 1607, and in 1620 produced that curious picture of "Horatius Cocles defending the Sublician Bridge" in the Antwerp museum.

The third son of Franz Francken the first is Franz Francken the second, who signed himself in pictures till 1616 "the younger," from 1630 till his death "the elder" F. Francken.

Franz Francken the second was born in 1581. In 1605 he entered the gild, of which he subsequently became the president, and in 1642 he died. His earliest composition is the "Crucifixion" in the Belvedere at Vienna, dated 1606. His latest compositions as "the younger" F. Francken are the "Adoration of the Virgin" (1616) in the gallery of Amsterdam, and the "Woman taken in Adultery" (1628) in Dresden. From 1616 to 1630 many of his pieces are signed F. Francken; then come the "Seven Works of Charity" (1630) at Munich, signed "the elder F. F.," the "Prodigal Son" (1633) at the Louvre.

F. Francken the third, the last of his name who deserves to be recorded, passed in the Antwerp gild in 1639 and died at Antwerp in 1667. His practice was chiefly confined to adding figures to the architectural or landscape pieces of other artists. As Franz Pourbus sometimes put in the portrait figures for Franz Francken the second, so Franz Francken the third often introduced the necessary personages into the works of Pieter Neefs the younger (museums of St. Petersburg, Dresden and The Hague). In a "Moses striking the Rock," dated 1654, of the Augsburg gallery, this last of the Franckens signs D. 6 (Den ouden) F. Franck.

FRANCO, an expression in foreign commerce, meaning that a price quoted includes not only the cost of the goods, but all the costs entailed in delivering them to the purchaser's address, *i.e.*, cost, insurance, shipping freight, the import duty levied by the importing country, foreign carriage, etc.

FRANCO-GERMAN WAR (1870-1871). The victories of Prussia in 1866 over the Austrians and their German allies (*see SEVEN WEEKS' WAR*) rendered it evident to the statesmen and soldiers of France that a struggle between the two nations could only be a question of time. Belated measures were initiated in France to place the armament and equipment of the troops on a level with the requirements of the times. The chassepot, a new breech-loading rifle, immensely superior to the Prussian needle-gun, was issued; the artillery trains were overhauled, and a new machine-gun, the *mitrailleuse*, from which much was expected, introduced. Wide schemes of reorganization (due mainly to Marshal Niel) were formulated, but little was done to put them into effect. The emperor Napoleon III. also nourished illusory hopes of an alliance with Austria and Italy. In the first week of June 1870, General Lebrun, as his confidential agent, was sent to Vienna to try to concert a plan of joint operations with Austria against Prussia. Italy was also to be included in the alliance.

What grounds there were for Napoleon's trust in the project remains uncertain, but in any case they were discounted by the fact that Moltke's plans were based on an accurate estimate of the time it would take Austria to mobilize and on the effect of a series of victories on French soil. In strong contrast to the French, plans for the strategic deployment of the Prussian army were prepared by the General Staff and kept up to date year by year as fresh circumstances (*e.g.*, the co-operation of the minor German armies) arose and new means of communication came into existence. The campaign was actually opened on a revise of 1868-1869, to which was added, on May 6, 1870, a secret memorandum for the General Staff.

Strategic Deployment of German Armies.—Under the German organization then existing the preliminary to all active operations was of necessity full and complete mobilization. Then followed transport by road and rail to the line selected for the "strategic deployment," and it was essential that no part of these operations should be disturbed by action on the part of the enemy. But no such delay imposed itself of necessity upon the French, and a vigorous offensive was so much in harmony with their traditions that the German plan had to be framed so as to

meet such emergencies. On the whole, Moltke concluded that the enemy could not undertake this offensive before the eighth day after mobilization. At that date about five French army corps (150,000 men) could be collected near Metz, and two corps (70,000) near Strasbourg; and as it was six days' march from Metz to the Rhine, no serious attack could be delivered before the fourteenth day, by which day it could be met by superior forces near Kirchheimbolanden. As, however, the transport of the bulk of the Prussian forces could not begin till the ninth day, their ultimate line of detrainment need not be fixed until the French plans were disclosed, and, as it was important to strike at the earliest moment possible, the deployment was provisionally fixed to be beyond the Rhine on the line Wittlich-Neunkirchen-Landau. Of the thirteen North German corps three had to be left behind to guard the eastern frontier and the coast, one other, the VIII., was practically on the ground already and could concentrate by road, and the remaining nine were distributed to the nine through railway lines available. These ten corps were grouped in three armies, and as the French might violate Belgian neutrality or endeavour to break into southern Germany, two corps (Prussian Guard and Saxon XII. corps) were temporarily held back at a central position around Mainz, whence they could move rapidly up or down the Rhine valley. If Belgian neutrality remained unmolested, the reserve would join the III. army on the left wing, giving it a two to one superiority over its adversary; all three armies would then wheel to the right and combine in an effort to force the French army into a decisive battle on the Saar on or about the twenty-third day. As in this wheel the army on the right formed the pivot and was required only to stand fast, two corps only were allotted to it; two corps for the present formed the III. army, and the remaining five were assigned to the II. army in the centre.

When (16th-17th July) the South German states decided to throw in their lot with the rest, their three corps were allotted to the III. army, the Guards and Saxons to the II. army, whilst the three corps originally left behind were finally distributed one to each army, so that up to the investment of Metz the order of battle was as follows:

Headquarters:	
The king of Prussia	(General v. Moltke, chief of staff).
I. Army:	(I. corps, Manteuffel)
General v. Steinmetz	VII. " Zastrow
(C. of S., Sperling)	VIII. " Goeben
	(1st and 3rd cavalry divisions
	Total 85,000
II. Army:	(Guard Pr. August of Württemberg
Prince Frederick	(II. corps, Fransecky)
Charles (C. of S.,	III. " Alvensleben II.
Stiehle)	IV. " Alvensleben I.
	IX. " Manstein
	X. " Voigts-Rhetz
	XII. " (Saxons) crown prince
	of Saxony
	5th and 6th cavalry divisions
	Total 210,000
III. Army:	(V. corps, Kirchbach
crown prince of	(VI.) " Tümping
Prussia (C. of S.,	XI. " Bose
Blumenthal)	I. Bavarian, der Tann
	II. " Hartmann
	Württemberg div. } Werder
	Baden div. }
	(2nd and 4th cavalry divisions
	Total 180,000
	Grand Total . . . 475,000

(The units within brackets were those at first retained in Germany.)

Positions of the French Forces.—On the French side no such plan of operations was in existence when on the night of the 15th of July *Kriegs mobil* was telegraphed all over Prussia. An outline scheme had indeed been prepared as a basis for agreement with Austria and Italy, but practically no details were fixed, and the troops were without transport and supplies. Nevertheless, as speed was the essence of the contract, the troops were hurried up without waiting for their reserves—whose mobilization was then a

slow and complicated system—and the Prussian Intelligence Department was able to inform Moltke on the 22nd of July (seventh day of mobilization) that the French stood from right to left in the following order, on or near the frontier:

I. Corps	. . .	Marshal MacMahon, duke of Magenta (Strasbourg)
V. "	. . .	General de Failly (Saargemund and Bitche)
II. "	. . .	General Frossard (St. Avold)
IV. "	. . .	General de Ladmirault (Thionville)
		With, behind them:
III. "	. . .	Marshal Bazaine (Metz)
Guard	. . .	General Bourbaki (Nancy)
VI. Corps	. . .	Marshal Canrobert (Châlons)
VII. "	. . .	General Félix Douay (Belfort)

If therefore they began a forward movement on the 23rd (eighth day) the case foreseen by Moltke had arisen, and it became necessary to detain the II. army upon the Rhine. Without waiting for further confirmation of this intelligence, Moltke, with the consent of the king, altered the arrangements accordingly, a decision which, though foreseen, exercised the gravest influence on the course of events. As it happened this decision was premature, for the French could not yet move. The French rear services were chaotic. Supply trains had to be organized by requisition from the inhabitants, and even arms and ammunition procured for such reserves as had succeeded in joining. Nevertheless, by almost superhuman exertions on the part of the railways and administrative services, all essential deficiencies were made good, and by July 28 (13th day) the troops had received all that was absolutely indispensable and might well have been led against the enemy, who, thanks to Moltke's premature action, were for the moment at a very serious disadvantage. But the French generals did not utilise this opportunity to concentrate upon the heads of the Prussian columns as they struggled through the defiles of the Hardt.

To meet the possible danger, which came to his knowledge during the course of the 29th, Moltke sent a confidential staff officer, Colonel v. Verdy du Vernois, to the III. army to impress upon the crown prince the necessity of an immediate advance to distract the enemy's attention from the I. and II. armies; but, like the French generals, the crown prince pleaded that he could not move until his trains were complete. Fortunately for the Germans, the French intelligence service not only failed to inform the staff of this opportunity, but it allowed itself to be hypnotized by rumours. In imagination they saw oncoming men behind every forest, and, to guard against these dangers, the French troops were marched and counter-marched along the frontiers in the vain hope of discovering an ideal defensive position which should afford full scope to the power of their new weapons.

As these delays were exerting a most unfavourable effect on public opinion not only in France but throughout Europe, the emperor decided on Aug. 1 to initiate a movement towards the Saar, for its moral effect.

On this day the French corps held the following positions from right to left:

I. Corps	. . .	Hagenau
II. "	. . .	Forbach
III. "	. . .	St. Avold
IV. "	. . .	Bouzonville
V. "	. . .	Bitche
VI. "	. . .	Châlons
VII. "	. . .	Belfort and Colmar
Guard	. . .	near Metz

Saarbrücken.—The French II. corps was directed to advance on the following morning direct on Saarbrücken, supported on the flanks by two divisions from the V. and III. corps. The order was duly carried out, and the Prussians (one battalion, two squadrons and a battery), seeing the overwhelming numbers opposed to them, fell back fighting and vanished to the northward, having given a very excellent example of steadiness and discipline to their enemy. The latter contented themselves by occupying Saarbrücken and its suburb St. Johann, and here, as far as the troops were concerned, the incident closed. Its effect,

however, proved far-reaching. The Prussian staff could not conceive that nothing lay behind this display of five whole divisions, and immediately took steps to meet the expected danger. In their excitement, although they had announced the beginning of the action to the king's headquarters at Mainz, they forgot to notify the close and its results, so that Moltke was not in possession of the facts till noon on the 3rd of August. Meanwhile, Steinmetz, left without instructions and fearing for the safety of the II. army, the heads of whose columns were still in the defiles of the Hardt, moved the I. army from the neighbourhood of Merzig obliquely to his left front, so as to strike the flank of the French army if it continued its march towards Kaiserslautern, in which direction it appeared to be heading.

Whilst this order was in process of execution, Moltke, aware that the II. army was behind time in its march, issued instructions to Steinmetz for Aug. 4, which entailed a withdrawal to the rear, the idea being that both armies should, if the French advanced, fight a defensive battle in a selected position farther back. Steinmetz obeyed, though bitterly resenting the idea of retreat. This movement, further, drew his left across the roads reserved for the right column of the II. army, and on receipt of a peremptory order from Prince Frederick Charles to evacuate the road, Steinmetz telegraphed for instructions direct to the king, over Moltke's head. In reply he received a telegram from Moltke, ordering him to clear the road at once, and couched in terms which he considered as a severe reprimand. An explanatory letter, meant to soften the rebuke, was delayed in transmission and did not reach him till too late to modify the orders he had already issued. It must be remembered that Steinmetz at the front was in a better position to judge the apparent situation than was Moltke at Mainz, and that all through the day of Aug. 5 he had received intelligence indicating a change of attitude in the French army.

Battle of Spicheren.—The news of the German victory at Weissenburg on the 4th (*see below*) had in fact completely paralysed the French headquarters, and orders were issued by them during the course of the 5th to concentrate the whole army of the Rhine on the selected position of Cadenbronn. As a preliminary, Frossard's corps withdrew from Saarbrücken and began to entrench a position on the Spicheren heights, 3,000 yd. to the southward. Steinmetz, therefore, being quite unaware of the scheme for a great battle on the Saar about Aug. 9, felt that the situation would best be met, and the letter of his instructions strictly obeyed, by moving his whole command forward to the line of the Saar, and orders to this effect were issued on the evening of the 5th. In pursuance of these orders, the advance guard of the 14th division (Lieutenant General von Kameke) reached Saarbrücken about 9 A.M. on the 6th, where the Germans found to their amazement that the bridges were intact. To secure this advantage was the obvious duty of the commander on the spot, and he at once ordered his troops to occupy a line of low heights beyond the town to serve as a bridge-head. As the leading troops deployed on the heights Frossard's guns on the Spicheren Plateau opened fire, and the advanced guard battery replied. The sound of these guns unchained the whole fighting instinct carefully developed by a long course of Prussian manoeuvre training. Everywhere, generals and troops hurried towards the cannon thunder. Kameke, even more in the dark than Steinmetz as to Moltke's intentions and the strength of his adversaries, attacked at once, precisely as he would have done at manoeuvres, and in half an hour his men were committed beyond recall. As each fresh unit reached the field it was hurried into action where its services were most needed, and each fresh general as he arrived took a new view of the combat and issued new orders. On the other side, Frossard, knowing the strength of his position, called on his neighbours for support, and determined to hold his ground. Victory seemed certain. There were sufficient troops within easy reach to have ensured a crushing numerical superiority. But the other generals had not been trained to mutual support, and thought only of their own immediate security, and their staffs were too inexperienced to act upon even good intentions; and, finding himself in the course of the afternoon left to his own devices, Frossard began gradually to withdraw, even before the pressure

of the 13th German division on his left flank (about 8 P.M.) compelled his retirement. When darkness ended the battle the Prussians were scarcely aware of their victory. Steinmetz, who had reached the field about 6 P.M., rode back to his headquarters without issuing any orders, while the troops bivouacked where they stood, the units of three army corps being mixed up in almost inextricable confusion. But whereas out of 42,900 Prussians with 120 guns, who in the morning lay within striking distance of the enemy, no fewer than 27,000, with 78 guns were actually engaged; of the French, out of 64,000 with 210 guns only 24,000 with 90 guns took part in the action.

Action of Weissenburg.—Meanwhile on the German left wing the III. army had begun its advance. Early on Aug. 4 it crossed the frontier and fell upon a French detachment under Abel Douay, which had been placed near Weissenburg, partly to cover the Pigeonnier pass, but principally to consume the supplies accumulated in the little dismantled fortress, as these could not easily be moved. Against this force of under 4,000 men of all arms, the Germans brought into action successively portions of three corps, in all over 25,000 men with 90 guns. After six hours' fighting, in which the Germans lost some 1,500 men, the gallant remnant of the French withdrew deliberately and in good order, notwithstanding the death of their leader at the critical moment. The Germans were so elated by their victory over the enemy, whose strength they naturally overestimated, that they forgot to send cavalry in pursuit, and thus entirely lost touch with the enemy.

Next day the advance was resumed, the two Bavarian corps moving via Mattstall through the foothills of the Vosges, the V. corps on their left towards Preuschoorf, and the XI. farther to the left again, through the wooded plain of the Rhine valley. The 4th cavalry division scouted in advance, and army headquarters moved to Sulz. About noon the advanced patrols discovered MacMahon's corps in position on the left bank of the Sauer (*see WÖRTH: Battle of*). As his army was dispersed over a wide area, the crown prince determined to devote the 6th to concentrating the troops, and, probably to avoid alarming the enemy, ordered the cavalry to stand fast.

At night the outposts of the I. Bavarians and V. corps on the Sauer saw the fires of the French encampment and heard the noise of railway traffic, and rightly conjectured the approach of reinforcements. MacMahon had in fact determined to stand in the very formidable position he had selected, and he counted on receiving support both from the VII. corps (two divisions of which were being rallied up from Colmar) and from the V. corps, which lay around Bitche.

Battle of Wörth.—At dawn on Aug. 6 the commander of the V. corps outposts noticed certain movements in the French lines, and to clear up the situation brought his guns into action. As at Spicheren, the sound of the guns set the whole machinery of battle in motion. The French artillery immediately accepted the Prussian challenge. The I. Bavarians, having been ordered to be ready to move if they heard artillery fire, immediately advanced against the French left, encountering presently such a stubborn resistance that parts of their line began to give way. The Prussians of the V. corps felt that they could not abandon their allies, and Kirchbach, calling on the XI. corps for support, attacked with the troops at hand. When the crown prince tried to break off the fight it was too late. Both sides were feeding troops into the firing line, as and where they could lay hands on them. Up to 2 P.M. the French fairly held their own, but shortly afterwards their right yielded to the overwhelming pressure of the XI. corps, and by 3.30 it was in full retreat. The centre held on for another hour, but in its turn was compelled to yield, and by 4.30 all organized resistance was at an end. The débris of the French army was hotly pursued by the German divisional squadrons towards Reichshofen, where serious panic showed itself. When at this stage the tardy supports sent by de Failly from Bitche came on the ground they saw the hopelessness of intervention, and retired whence they had come. Fortunately for the French, the German 4th cavalry division, on which the pursuit should have devolved, had been forgotten by the German staff, and

did not reach the front before darkness fell. Out of a total of 82,000 within reach of the battlefield, the Germans succeeded in bringing into action 77,500. The French, who might have had 50,000 on the field, deployed only 37,000, and these suffered a collective loss of no less than 20,100; some regiments losing up to 90% and still retaining some semblance of discipline and order.

Under cover of darkness the remnants of the French army escaped. When at length the 4th cavalry division had succeeded in forcing a way through the confusion of the battlefield, all touch with the enemy had been lost, and being without firearms the troopers were checked by the French stragglers in the woods and the villages, and thus failed to establish the true line of retreat of the French. Ultimately the latter, having gained the railway near Lunéville, disappeared from the German front altogether, and all trace of them was lost until they were discovered, about Aug. 26, forming part of the army of Châlons, whither they had been conveyed by rail via Paris. This is a remarkable example of the strategical value of railways to an army operating in its own country.

In the absence of all resistance, the III. army now proceeded to carry out the original programme of marches laid down in Moltke's memorandum of May 6, events having nullified the plan for a battle on the Saar, and marching on a broad front through a fertile district it reached the line of the Moselle in excellent order about Aug. 17, where it halted to await the result of the great battle of Gravelotte-St. Privat.

Movements on the Saar.—We return now to the I. army at Saarbrücken. Its position on the morning of Aug. 7 gave cause for the gravest anxiety. At daylight a dense fog lay over the country, and through the mist sounds of heavy firing came from the direction of Forbach, where French stragglers had rallied during the night. The confusion on the battlefield was appalling, and the troops in no condition to go forward. Except the 3rd, 5th and 6th cavalry divisions no closed troops were within a day's march; hence Steinmetz decided to spend the day in reorganizing his infantry, under cover of his available cavalry. But the German cavalry and staff were unequal to their task. The 6th cavalry division, which had bivouacked on the battlefield, sent on only one brigade towards Forbach, retaining the remainder in reserve. The 5th, thinking that the 6th had already undertaken all that was necessary, withdrew behind the Saar, and the 3rd, also behind the Saar, reported that the country in its front was unsuited to cavalry movements, and only sent out a few officers' patrols. These were well led, but were too few in number, and their reports were consequently unconvincing.

In the course of the day Steinmetz became very uneasy, and ultimately he decided to concentrate his army by retiring the VII. and VIII. corps behind the river on to the I. (which had arrived near Saarlouis), thus clearing the Saarbrücken-Metz road for the use of the II. army. But at this moment Prince Frederick Charles suddenly modified his views. During the 6th of August his scouts had reported considerable French forces near Bitche (these were the V., de Failly's corps), and early in the morning of the 7th he received a telegram from Moltke informing him that MacMahon's beaten army was retreating on the same place (the troops observed were in fact those which had marched to MacMahon's assistance). The prince forthwith deflected the march of the Guards, IV. and X. corps, towards Rohrbach, whilst the IX. and XII. closed up to supporting distance behind them. Thus, as Steinmetz moved away to the west and north, Frederick Charles was diverging to the south and east, and a great gap was opening in the very centre of the German front. This was closed only by the III. corps, still on the battlefield, and by portions of the X. near Saargemünd, whilst within striking distance lay 130,000 French troops, prevented only by the incapacity of their chiefs from a decisive counter-stroke.

Fortunately for the Prussians, Moltke at Mainz took a different view. Receiving absolutely no intelligence from the front during the 7th, he telegraphed orders to the I. and II. armies (10.25 P.M.) to halt on the 8th, and impressed on Steinmetz the necessity of employing his cavalry to clear up the situation. The I. army had already begun the marches ordered by Steinmetz. It was now

led back practically to its old bivouacs amongst the unburied dead. Prince Frederick Charles only conformed to Moltke's order with the III. and X. corps; the remainder executed their concentration towards the south and east.

During the night of Aug. 7 Moltke decided that the French army must be in retreat towards the Moselle and forthwith busied himself with the preparation of fresh tables of march for the two armies, his object being to swing up the left wing to outflank the enemy from the south. This work, and the transfer of headquarters to Homburg, needed time, hence no fresh orders were issued to either army, and neither commander would incur the responsibility of moving without any. The I. army therefore spent a fourth night in bivouac on the battle-field. But Constantin von Alvensleben, commanding the III. corps, a man of very different stamp from his colleagues, hearing at first hand that the French had evacuated St. Avold, set his corps in motion early in the morning of Aug. 10 down the St. Avold-Metz road, reached St. Avold and obtained conclusive evidence that the French were retreating.

Advance to the Moselle.—During the 9th after 48 wasted hours the orders for the advance to the Moselle were issued. These were based, not on an exact knowledge of where the French army actually stood, but on the opinion Moltke had formed as to where it ought to have been on military grounds solely.

Actually on Aug. 7 the emperor had decided to attack the Germans on the 8th with the whole Rhine Army, but this decision was upset by alarmist reports from the beaten army of MacMahon. He then decided to retreat to the Moselle, as Moltke had calculated, and there to draw to himself the remnants of MacMahon's army (now near Lunéville). At the same time he assigned the strictly executive command of the Rhine Army to Marshal Bazaine. This retreat was begun during the course of Aug. 8 and 9; but on the night of the 9th urgent telegrams from Paris induced the emperor to suspend the movement, and during the 10th the whole army took up a strong position on the French Nied.

Meanwhile the II. German army had received its orders to march in a line of army corps on a broad front in the general direction of Pont-à-Mousson, well to the south of Metz. The I. army was to follow by short marches in échelon on the right; only the III. corps was directed on Falkenberg, a day's march farther towards Metz along the St. Avold-Metz road. The movement was begun on the 10th, and towards evening the French army was located on the right front of the III. corps. This entirely upset Moltke's hypothesis, and called for a complete modification of his plans, as the III. corps alone could not be expected to resist the impact of Bazaine's five corps. The III. corps therefore received orders to stand fast for the moment, and the remainder of the II. army was instructed to wheel to the right and concentrate for a great battle to the east of Metz on the 16th or 17th. Before, however, these orders had been received the sudden retreat of the French completely changed the situation. The Germans therefore continued their movement towards the Moselle. On the 12th Bazaine had been definitely invested with the command-in-chief of the Army of the Rhine and next day the French took up a fresh position 5 m. to the east of Metz, where they were located by the cavalry and the advanced guards of the German I. army.

Battle of Colombey-Borny.—Again Moltke ordered the I. army to observe and hold the enemy, whilst the II. was to swing round to the north. The cavalry was to scout beyond the Moselle and intercept all communication with the heart of France (*see* Metz). By this time the whole German army had imbibed the idea that the French were in full retreat and endeavouring to evade a decisive struggle. When therefore during the 14th their outposts observed signs of retreat in the French position, their impatience could no longer be restrained; as at Wörth and Spicheren, an outpost commander brought up his guns, and at the sound of their fire, every unit within reach spontaneously got under arms (battle of Colombey-Borny). In a short time, with or without orders, the I., VII., VIII. and IX. corps were in full

march to the battle-field. But the French, too, turned back to fight, and an obstinate engagement ensued, at the close of which the Germans barely held the ground and the French withdrew during the night under cover of the Metz forts.

Still, though the fighting had been indecisive, the conviction of victory remained with the Germans, and the idea of a French retreat became an obsession. To this idea Moltke gave expression in his orders issued early on the 15th, in which he laid down that the "fruits of the victory" of the previous evening could only be reaped by a vigorous pursuit towards the passages of the Meuse, where it was hoped the French might yet be overtaken. This order, however, did not allow for the hopeless inability of the French staff to regulate the movement of congested masses of men, horses and vehicles, such as were now accumulated in the streets and environs of Metz. Whilst Bazaine had come to no definite decision whether to stand and fight or continue to retreat, and was merely drifting under the impressions of the moment, the Prussian leaders, in particular Prince Frederick Charles, saw in imagination the French columns in rapid orderly movement towards the west, and calculated that at best they could not be overtaken short of Verdun.

In this order of ideas the whole of the II. army, followed on its right rear by two-thirds of the I. army (the I. corps being detached to observe the eastern side of the fortress), were pushed on towards the Moselle, the cavalry far in advance towards the Meuse, whilst only the 5th cavalry division was ordered to scout towards the Metz-Verdun road, and even that was disseminated over far too wide an area.

Later in the day (15th) Frederick Charles sent orders to the III. corps, which was on the right flank of his long line of columns and approaching the Moselle at Corny and Novéant, to march via Gorze to Mars-la-Tour on the Metz-Verdun road; to the X. corps, strung out along the road from Thiaucourt to Pont-à-Mousson, to move to Jarny; and for the remainder to push on westward to seize the Meuse crossings. No definite information as to the French army reached him in time to modify these instructions.

Meanwhile the 5th (Rheinbaben's) cavalry division, at about three in the afternoon, had come into contact with the French cavalry in the vicinity of Mars-la-Tour, and gleaned intelligence enough to show that no French infantry had as yet reached Rezonville. The commander of the X. corps at Thiaucourt, informed of this, became anxious for the security of his flank during the next day's march and decided to push out a strong flanking detachment under Caprivi, to support Rheinbaben and maintain touch with the III. corps marching on his right rear.

Battle of Vionville-Mars-la-Tour.—Alvensleben, to whom the 6th cavalry division had meanwhile been assigned, seems to have received no local intelligence whatsoever; and at daybreak on the 16th he began his march in two columns, the 6th division on Mars-la-Tour, the 5th towards the Rezonville-Vionville plateau. And shortly after 9.15 A.M. he suddenly discovered the truth. The entire French army lay on his right flank, and his nearest supports were almost a day's march distant. In this crisis he made up his mind at once to attack with every available man, and to continue to attack, in the conviction that his audacity would serve to conceal his weakness. All day long, therefore, the Brandenburgers of the III. corps, supported ultimately by the X. corps and part of the IX., attacked again and again, despite repulse. The enemy was thrice their strength, but very differently led, and made no adequate use of his superiority (battle of Vionville-Mars-la-Tour).

Meanwhile Prince Frederick Charles, at Pont-à-Mousson, was still confident in the French retreat to the Meuse, and had even issued orders for the 17th on that assumption. Firing had been heard since 9.15 A.M., and about noon Alvensleben's first report had reached him, but it was not till after 2 that he realized the situation. Then, mounting his horse, he covered the 15 m. to Flavigny over crowded and difficult roads within the hour, and on his arrival abundantly atoned for his strategic errors by his unconquerable determination and tactical skill. When darkness put a stop to the fighting, he considered the position. Cancelling

all previous orders, he called all troops within reach to the battlefield and resigned himself to wait for them. The situation was indeed critical. The whole French army of five corps, only half of which had been engaged, lay in front of him. His own army lay scattered over an area of 30 m. by 20, and only some 20,000 fresh troops—of the IX. corps—could reach the field during the forenoon of the 17th. He did not then know that Moltke had already intervened and had ordered the VII., VIII. and II corps¹ to his assistance. Daylight revealed the extreme exhaustion of both men and horses. The men lay around in hopeless confusion amongst the killed and wounded, each where sleep had overtaken him, and thus the extent of the actual losses, heavy enough, could not be estimated. Across the valley, bugle sounds revealed the French already alert, and presently a long line of skirmishers approached the Prussian position. But they halted just beyond rifle range, and it was soon evident that they were only intended to cover a further withdrawal. Presently came the welcome intelligence that the reinforcements were well on their way.

About noon the king and Moltke drove up to the ground, and there was an animated discussion as to what the French would do next. Aware of their withdrawal from his immediate front, Prince Frederick Charles reverted to his previous idea and insisted that they were in full retreat towards the north, and that their entrenchments near Point du Jour and St. Hubert (*see map in article Metz*) were at most a rearguard position. Moltke was inclined to the same view, but considered the alternative possibility of a withdrawal towards Metz, and about 2 P.M. orders were issued to meet these divergent opinions. The whole army was to be drawn up at 6 A.M. on the 18th in an échelon facing north, so as to be ready for action in either direction. The king and Moltke then drove to Pont-à-Mousson, and the troops bivouacked in a state of readiness. The rest of the 17th was spent in restoring order in the shattered III. and X. corps, and by nightfall both corps were reported fit for action. Strangely enough, there were no organized cavalry reconnaissances, and no intelligence of importance was collected during the night of the 17th–18th.

Battle of Gravelotte-Saint Privat.—Early on the 18th the troops began to move into position in the following order from left to right: XII. (Saxons), Guards, IX., VIII. and VII. The X. and III. were retained in reserve.

The idea of the French retreat was still uppermost in the prince's mind, and the whole army therefore moved north. But between 10 and 11 A.M. part of the truth—viz., that the French had their backs to Metz and stood in battle order from St. Hubert northwards—became evident, and the II. army, pivoting on the I., wheeled to the right and moved eastward. Suddenly the IX. corps fell right on the centre of the French line at Amanvillers, where it had been imagined that the French flank rested, and a most desperate encounter began, superior control, as before, ceasing after the guns had opened fire. Prince Frederick Charles, however, a little farther north, again asserted his tactical ability, and about 7 P.M. he brought into position three fresh army corps for the final attack. The sudden collapse of French resistance, due to the frontal attack of the Guards (St. Privat) and the turning movement of the Saxons (Roncourt), rendered the use of this mass unnecessary, but the resolution to use it was there. On the German right (I. army), about Gravelotte, all superior leading ceased quite early in the afternoon, and at night the French still showed an unbroken front. Until midnight, when the prince's victory was reported, the suspense at headquarters was terrible. The I. army was exhausted, no steps had been taken to ensure support from the III. army, and the IV. corps (II. army) lay inactive 30 m. away.

Having let slip the great opportunity of August 16 and 17 which fortune had flung into his hands, Bazaine had now allowed himself to be driven back into Metz, where he was content to stay. His motives and the question of his conduct are discussed under BAZAINE.

On the German side the victory at St. Privat was at once followed up by the headquarters. Early on the 19th the investment of Bazaine's army in Metz was commenced. A new army, the Army of the Meuse (often called the IV.), was as soon as possible formed of all troops not required for the maintenance of the investment, and, under the command of the crown prince of Saxony, marched on towards Châlons, where MacMahon was known to be reorganizing the remainder of the French field army. The III. army also continued its assigned course in the direction of Paris.

Campaign of Sedan.—The operations which led to the capture of MacMahon's army in Sedan call for little explanation. Given seven corps, each capable of averaging 15 m. a day for a week in succession, opposed to four corps only, shaken by defeat and unable as a whole to cover more than 5 m. a day, the result could hardly be doubtful. But Moltke's method of conducting operations left his opponent many openings which could only be closed by excessive demands on the marching power of the men. Trusting only to his cavalry screen to secure information, he was always without any definite fixed point about which to manoeuvre, for whilst the reports of the screen and orders based thereon were being transmitted, the enemy was free to move, and Moltke based his calculations of such movements on strictly military grounds.

Thus whilst the German army, on a front of nearly 50 m., was marching due west on Paris, MacMahon, under political pressure, was moving parallel to them, but on a northerly route, to attempt the relief of Metz.

So unexpected was this move and so uncertain the information which called attention to it, that Moltke did not venture to change at once the direction of march of the whole army, but he directed the Army of the Meuse northward on Damvillers and ordered Prince Frederick Charles to detach two corps from the forces investing Metz to reinforce it. For the moment, therefore, MacMahon's move had succeeded, and the opportunity existed for Bazaine to break out. But at the critical moment the hopeless want of real efficiency in MacMahon's army compelled the latter so to delay his advance that it became evident to the Germans that there was no longer any necessity for the III. army to maintain the direction towards Paris, and that the probable point of contact between the Meuse army and the French lay nearer to the right wing of the III. army than to Prince Frederick Charles's investing force before Metz.

The detachment from the II. army was therefore countermanded, and the whole III. army changed front to the north, while the Meuse army headed the French off from the east. The latter came into contact with the head of the French columns, during the 29th, about Nouart, and on the 30th at Buzancy (battle of Beaumont); and the French, yielding to the force of numbers combined with superior moral, were driven north-westward upon Sedan (*q.v.*), right across the front of the III. army, which was now rapidly coming up from the south.

The morning of Sept. 1 found the French crowded around the little fortress of Sedan, with only one line of retreat to the north-west still open. By 11 A.M. the XI. corps (III. army) had already closed that line, and about noon the Saxons (Army of the Meuse) moving round between the town and the Belgian frontier joined hands with the XI., and the circle of investment was complete. The battle of Sedan was closed about 4.15 P.M. by the hoisting of the white flag. Terms were agreed upon during the night, and the whole French army, with the emperor, passed into captivity.

(F. N. M.)

Later Operations.—Thus in five weeks one of the French field armies was imprisoned in Metz, the other destroyed, and the Germans were free to march upon Paris. This seemed easy. There could be no organized opposition to their progress,¹ and Paris, if not so defenceless as in 1814, was more populous. Starvation was the best method of attacking an over-crowded fortress, and the Parisians were not thought to be proof against the deprivation of

¹The XIII. corps (Vinoy), which had followed MacMahon's army at some distance, was not involved in the catastrophe of Sedan, and by good luck as well as good management evaded the German pursuit and returned safely to Paris.

¹Of the I. army the I. corps was retained on the east side of Metz. The II. corps belonged to the II. army, but had not yet reached the front.

their accustomed luxuries. Even Moltke hoped that by the end of October he would be "shooting hares at Creisau," and with this confidence the German III. and IV. armies left the vicinity of Sedan on the 4th of September. The march called for no more than good staff arrangements, and the two armies arrived before Paris a fortnight later and gradually encircled the place—the III. army on the south, the IV. on the north side—in the last days of September. Headquarters were established at Versailles. Meanwhile the Third Empire had fallen, giving place on Sept. 4 to a republican Government of National Defence, which made its appeal to, and evoked, the spirit of 1792. Henceforward the French nation, which had left the conduct of the war to the regular army and had been little more than an excited spectator, took the burden upon itself.

Although of the regular army units only six regiments of infantry and ten of cavalry were left—outside Metz and other beleaguered garrisons—a great number of regular recruits and reservists were available. From these the government organized 280 battalions of infantry, or 280,000 men, 31 regiments of the Garde Mobile, framed by Marshal Niel in 1868, totalling 110,000 men, and 80,000 formed in battalions of the Garde Nationale, called into existence on Sept. 15, and including all able-bodied men of from 31 to 60 years of age. With cavalry regiments and corps of francs-tireurs the total was 583,000, and this initial figure was far exceeded before the war finished. The German staff had of course to reckon on the Garde Mobile, and did so beforehand, but they wholly underestimated both its effective members and its willingness, while, possessing themselves a system in which all the military elements of the German nation stood close behind the troops of the active army, they ignored the potentialities of the Garde Nationale.

Meanwhile, both as a contrast to the events that centered on Paris and because in point of time they were decided for the most part in the weeks immediately following Sedan, we must briefly allude to the sieges conducted by the Germans—Paris (*q.v.*), Metz (*q.v.*) and Belfort (*q.v.*) excepted. Old and ruined as many of them were, the French fortresses possessed considerable importance in the eyes of the Germans. Strassburg, in particular, the key of Alsace, the standing menace to South Germany and the most conspicuous of the spoils of Louis XIV.'s *Raubkriege*, was an obvious target. Operations were begun on Aug. 9, three days after Wörth, Werder's corps (Baden troops and Prussian Landwehr) making the siege. The French commandant, Urich, surrendered after a stubborn resistance on Sept. 28. Of the smaller fortresses many, being practically unarmed and without garrisons, capitulated at once. Toul, defended by Major Huck with 2,000 mobiles, resisted for forty days, and drew upon itself the efforts of 13,000 men and 100 guns. Verdun, commanded by Guérin de Waldersbach, held out till after the fall of Metz. Some of the fortresses lying to the north of the Prussian line of advance on Paris, *e.g.*, Mézières, resisted up to January 1871, though of course this was very largely due to the diminution of pressure caused by the appearance of new French field armies in October. On Sept. 9 a strange incident took place at the surrender of Laon. A powder magazine was blown up by the soldiers in charge and 300 French and a few German soldiers were killed by the explosion. But as the Germans advanced, their lines of communication were thoroughly organized, and the belt of country between Paris and the Prussian frontier subdued and garrisoned. Most of these fortresses were small town enceintes, dating from Vauban's time, and open, under the new conditions of warfare, to concentric bombardment from positions formerly out of range, upon which the besieger could place as many guns as he chose to employ. In addition they were usually deficient in armament and stores and garrisoned by newly-raised troops. Belfort, where the defenders strained every nerve to keep the besiegers out of bombarding range, and Paris formed the only exceptions to this general rule.

The "Défense Nationale."—The policy of the new French government was defined by Jules Favre on the 6th of September. "It is for the king of Prussia, who has declared that he is making war on the Empire and not on France, to stay his hand; we shall

not cede an inch of our territory or a stone of our fortresses." These proud words, so often ridiculed as empty bombast, were the prelude of a national effort which re-established France in the eyes of Europe as a great power, even though provinces and fortresses were ceded in the peace that that effort proved unable to avert. They were translated into action by Léon Gambetta, who escaped from Paris in a balloon on Oct. 7, and established the headquarters of the defence at Tours, where already the "Delegation" of the central government—which had decided to remain in Paris—had concentrated the machinery of government. Thenceforward Gambetta and his principal assistant de Freycinet directed the whole war in the open country, co-ordinating it, as best they could with the precarious means of communication at their disposal, with Trochu's military operations in and round the capital. His critics—Gambetta's personality was such as to ensure him numerous enemies among the higher civil and military officials, over whom, in the interests of *La Patrie*, he rode rough-shod—have acknowledged the fact, which is patent enough in any case, that nothing but Gambetta's driving energy enabled France in a few weeks to create and to equip twelve army corps, representing thirty-six divisions (600,000 rifles and 1,400 guns), after all her organized regular field troops had been destroyed or neutralized. It is claimed that by undue interference with the generals at the front, by presuming to dictate their plans of campaign, and by forcing them to act when the troops were unready, Gambetta and de Freycinet nullified the efforts of themselves and the rest of the nation and subjected France to a humiliating treaty of peace. But even the brief narrative given below must at least suggest to the reader the existence amongst the generals and higher officials of a dead weight of passive resistance to the Delegation's orders, of unnecessary distrust of the qualities of the improvised troops, and above all of the utter fear of responsibility that twenty years of literal obedience had bred. The closest study of the war cannot lead to any other conclusion than this, that whether or not Gambetta as a strategist took the right course in general or in particular cases, no one else would have taken any course whatever.

On the approach of the enemy Paris hastened its preparations for defence to the utmost, while in the provinces, out of reach of the German cavalry, new army corps were rapidly organized out of the few constituted regular units not involved in the previous catastrophes, the depot troops and the mobile national guard. The first-fruits of these efforts were seen in Beauce, where early in October important masses of French troops prepared not only to bar the further progress of the invader but actually to relieve Paris. The so-called "fog of war"—the armed inhabitants, francs-tireurs, sedentary national guard and volunteers—prevented the German cavalry from venturing far out from the infantry camps around Paris, and behind this screen the new XV. army corps assembled on the Loire. But an untimely demonstration of force alarmed the Germans, all of whom, from Moltke downwards, had hitherto disbelieved in the existence of the French new formations, and the still unready XV. corps found itself the target of an expedition of the I. Bavarian corps, which drove the defenders out of Orleans after a sharp struggle, while at the same time another expedition swept the western part of Beauce, sacked Châteaudun as a punishment for its brave defence, and returned via Chartres, which was occupied.

After these events the French forces disappeared from German eyes for some weeks. D'Aurelle de Paladines, the commander of the "Army of the Loire" (XV. and XVI. corps), improvised a camp of instruction at Salbris in Sologne, several marches out of reach, and subjected his raw troops to a stern régime of drill and discipline. At the same time an "Army of the West" began to gather on the side of Le Mans. This army was almost imaginary, yet rumours of its existence and numbers led the German commanders into the gravest errors, for they soon came to suspect that the main army lay on that side and not on the Loire, and this mistaken impression governed the German dispositions up to the very eve of the decisive events around Orleans in December. Thus when at last D'Aurelle took the offensive from Tours (whither he had transported his forces, now 100,000 strong) against the posi-

tion of the I. Bavarian corps near Orleans, he found his task easy. The Bavarians, outnumbered and unsupported, were defeated with heavy losses in the battle of Coulmiers (November 9), and, had it not been for the inexperience, want of combination, and other technical weaknesses of the French, they would have been annihilated. What the results of such a victory as Coulmiers might have been, had it been won by a fully organized, smoothly working army of the same strength, it is difficult to overestimate. As it was, the retirement of the Bavarians rang the alarm bell all along the line of the German positions, and that was all.

Then once again, instead of following up its success, the French army disappeared from view. The victory had emboldened the "fog of war" to make renewed efforts, and resistance to the pressure of the German cavalry grew day by day. The Bavarians were reinforced by two Prussian divisions and by all available cavalry commands, and constituted as an "army detachment" under the grand-duke Friedrich Franz of Mecklenburg-Schwerin to deal with the Army of the Loire, the strength of which was far from being accurately known. Meantime the capitulation of Metz on Oct. 28 had set free the veterans of Prince Frederick Charles, the best troops in the German army, for field operations. The latter were at first misdirected to the upper Seine, and yet another opportunity arose for the French to raise the siege of Paris. But D'Aurelle utilized the time he had gained in strengthening the army and in imparting drill and discipline to the new units which gathered round the original nucleus of the XV. and XVI. corps. All this was, however, unknown and even unsuspected at the German headquarters, and the invaders, feeling the approaching crisis, became more than uneasy as to their prospects of maintaining the siege of Paris.

The Orleans Campaign.—At this moment, in the middle of November, the general situation was as follows: the German III. and Meuse armies, investing Paris, had had to throw off important detachments to protect the enterprise, which they had undertaken on the assumption that no further field armies of the enemy were to be encountered. The maintenance of their communications with Germany, relatively unimportant when the struggle took place in the circumstances of field warfare, had become supremely necessary, now that the army had come to a standstill and undertaken a great siege, which required heavy guns and constant replenishment of ammunition and stores. The rapidity of the German invasion had left no time for the proper organization and full garrisoning of these communications, which were now threatened, not merely by the Army of the Loire, but by other forces assembling on the area protected by Langres and Belfort. The latter, under General Cambriels, were held in check and no more by the Baden troops and reserve units (XIV. German corps) under Werder, and eventually without arousing attention they were able to send 40,000 men to the Army of the Loire. This army, still around Orleans, thus came to number perhaps 150,000 men, and opposed to it, about Nov. 14 the Germans had only the Army Detachment of about 40,000, the II. army being still distant. It was under these conditions that the famous Orleans campaign took place. After many vicissitudes of fortune, and with many misunderstandings between Prince Frederick Charles, Moltke and the grand-duke, the Germans were ultimately victorious, thanks principally to the brilliant fighting of the X. corps at Beaune-la-Rolande (Nov. 28), which was followed by the battle of Loigny-Poupry on Dec. 2 and the second capture of Orleans after heavy fighting on Dec. 4.

The result of the capture of Orleans was the severance of the two wings of the French army, henceforward commanded respectively by Chanzy and Bourbaki. The latter fell back at once and hastily, though not closely pursued, to Bourges. But Chanzy, opposing the detachment between Beaugency and the Forest of Marchenoir, was of sterner metal, and in the five days' general engagement around Beaugency (December 7-11) the Germans gained little or no real advantage. Indeed their solitary material success, the capture of Beaugency, was due chiefly to the fact that the French there were subjected to conflicting orders from the military and the governmental authorities. Chanzy then abandoned little but the field of battle, and on the grand-duke's repre-

sentations Prince Frederick Charles, leaving a mere screen to impose upon Bourbaki (who allowed himself to be deceived and remained inactive), hurried thither with the II. army. After that Chanzy was rapidly driven north-westward, though always presenting a stubborn front. The Delegation left Tours and betook itself to Bordeaux, whence it directed the government for the rest of the war. But all this continuous marching and fighting, and the growing severity of the weather, compelled Prince Frederick Charles to call a halt for a few days. About Dec. 19, therefore, the Germans (II. army and Detachment) were closed up in the region of Chartres, Orleans, Auxerre and Fontainebleau, Chanzy along the river Sarthe about Le Mans and Bourbaki still passive towards Bourges.

During this, as during other halts, the French government and its generals occupied themselves with fresh plans of campaign, the former with an eager desire for results, the latter (Chanzy excepted) with many misgivings. Ultimately, and fatally, it was decided that Bourbaki, whom nothing could move towards Orleans, should depart for the south-east, with a view to relieving Belfort and striking perpendicularly against the long line of the Germans' communications. This movement, bold to the point of rashness with such raw troops, seems to have been suggested by de Freycinet. As the execution of it fell actually into incapable hands, it is difficult to judge what would have been the result had a Chanzy or a Faiderbe been in command of the French. At any rate it was vicious in so far as immediate advantages were sacrificed to hopes of ultimate success which Gambetta and de Freycinet did wrong to base on Bourbaki's powers of generalship. Late in December, for good or evil, Bourbaki marched off into Franche-Comté and ceased to be a factor in the Loire campaign. A mere calculation of time and space sufficed to show the German headquarters that the moment had arrived to demolish the stubborn Chanzy.

Le Mans.—Prince Frederick Charles resumed the interrupted offensive, pushing westward with four corps and four cavalry divisions which converged on Le Mans. There on Jan. 10, 11, and 12, 1871, a stubbornly contested battle, in which the Germans engaged 75,000 against 90,000 French "improvised" troops, ended with the retreat of the French, who owed their defeat solely to the misbehaviour of the Breton mobiles. These, after deserting their post on the battlefield at a mere threat of the enemy's infantry, fled in disorder and infected with their terrors the men in the reserve camps of instruction, which broke up in turn. But Chanzy, resolute as ever, drew off his field army intact towards Laval, where a freshly raised corps joined him. The prince's army was far too exhausted to deliver another effective blow, and the main body of it gradually drew back into better quarters, while the grand duke departed for the north to aid in opposing Faiderbe. Some idea of the strain to which the invaders had been subjected may be gathered from the fact that army corps, originally 30,000 strong, were in some cases reduced to 10,000 and even fewer bayonets. And at this moment Bourbaki was at the head of 120,000 men! Indeed, so threatening seemed the situation on the Loire, though the French south of that river between Gien and Blois were mere isolated brigades, that the prince hurried back from Le Mans to Orleans to take personal command. A fresh French corps, bearing the number XXV., and being the twenty-first actually raised during the war, appeared in the field towards Blois. Chanzy was again at the head of 156,000 men. He was about to take the offensive against the 40,000 Germans left near Le Mans when to his bitter disappointment he received the news of the armistice. "We have still France," he had said to his staff, undeterred by the news of the capitulation of Paris, but now he had to submit, for even if his improvised army was still cheerful, there were many significant tokens that the people at large had sunk into apathy and hoped to avoid worse terms of peace by discontinuing the contest at once.

So ended the critical period of the "*Défense nationale*." It may be taken to have lasted from the day of Coulmiers to the last day of Le Mans, and its central point was the battle of Beaune-la-Rolande. Its characteristics were, on the German side, inadequacy of the system of strategy practised, which became palpable as soon

as the organs of reconnaissance met with serious resistance, misjudgment of and indeed contempt for the fighting powers of "new formations," and the rise of a spirit of ferocity in the man in the ranks, born of his resentment at the continuance of the war and the ceaseless sniping of the franc-tireur's rifle and the peasant's shot-gun. On the French side the continual efforts of the statesmen to stimulate the generals to decisive efforts, coupled with actual suggestions as to the plans of the campaign to be followed (in default, be it said, of the generals themselves producing such plans), and the professional soldiers' distrust of half-trained troops, acted and reacted upon one another in such a way as to neutralize the powerful, if disconnected and erratic, forces that the war and the Republic had unchained. As for the soldiers themselves, their most conspicuous qualities were their uncomplaining endurance of fatigues and wet bivouacs during an unusually bitter winter, and in action their capacity for a single great effort and no more. But they were unreliable in the hands of the veteran regular general, because they were heterogeneous in recruiting, and unequal in experience and military qualities, and the French staff was wholly incapable of moving masses of troops with the rapidity demanded by the enemy's methods of war, so that on the whole it is difficult to know whether to wonder more at their missing success or at their so nearly achieving it.

Faidherbe's Campaign.—The decision, as we have said, was fought out on the Loire and the Sarthe. Nevertheless the glorious story of the "*Défense nationale*" includes two other important campaigns—that of Faidherbe in the north and that of Bourbaki in the east.

In the north the organization of the new formations was begun by Dr. Testelin and General Farre. Bourbaki held the command for a short time in November before proceeding to Tours, but the active command in field operations came into the hands of Faidherbe, a general whose natural powers, so far from being cramped by years of peace routine and court repression, had been developed by a career of pioneer warfare and colonial administration. General Farre was his capable chief of staff. Troops were raised from fugitives from Metz and Sedan, as well as from depot troops and the Garde Mobile, and several minor successes were won by the national troops in the Seine valley, for here, as on the side of the Loire, mere detachments of the investing army round Paris were almost powerless. But the capitulation of Metz came too soon for the full development of these sources of military strength, and the German I. army under Manteuffel, released from duty at Metz, marched north-eastward, capturing the minor fortresses on its way. Before Faidherbe assumed command, Farre had fought several severe actions near Amiens, but, greatly outnumbered, had been defeated and forced to retire behind the Somme. Another French general, Friand, had also engaged the enemy without success near Rouen. Faidherbe assumed the command on Dec. 3, and promptly moved forward. A general engagement on the little river Hallue (Dec. 23), east-north-east of Amiens, was fought with no decisive results, but Faidherbe, feeling that his troops were only capable of winning victories in the first rush, drew them off on the 24th. His next effort, at Bapaume (Jan. 2-3, 1871), was more successful, but its effects were counterbalanced by the surrender of the fortress of Péronne (Jan. 9) and the consequent establishment of the Germans on the line of the Somme. Meanwhile the Rouen troops had been contained by a strong German detachment, and there was no further chance of succouring Paris from the north. But Faidherbe, like Chanzy, was far from despair, and in spite of the deficiencies of his troops in equipment (50,000 pairs of shoes, supplied by English contractors, proved to have paper soles), he risked a third great battle at St. Quentin (Jan. 19). This time he was severely defeated, though his loss in killed and wounded was about equal to that of the Germans, who were commanded by Goeben. Still the attempt of the Germans to surround him failed and he drew off his forces with his artillery and trains unharmed. The Germans, who had been greatly impressed by the solidity of his army, did not pursue him far, and Faidherbe was preparing for a fresh effort when he received orders to suspend hostilities.

The last episode is Bourbaki's campaign in the east, with its

mournful close at Pontarlier. Before the crisis of the last week of November, the French forces under General Crémier, Cambriels' successor, had been so far successful in minor enterprises that, as mentioned above, the right wing of the Loire army, severed from the left by the battle of Orleans and subsequently held inactive at Bourges and Nevers, was ordered to Franche Comté to take the offensive against the XIV. corps and other German troops there, to relieve Belfort and to strike a blow across the invaders' line of communications. But there were many delays in execution. The staff work, which was at no time satisfactory in the French armies of 1870, was complicated by the snow, the bad state of the roads, and the mountainous nature of the country, and Bourbaki, a brave general of division in action, but irresolute and pretentious as a commander-in-chief, was not the man to cope with the situation. Only the furious courage and patient endurance of hardships of the rank and file, and the good qualities of some of the generals, such as Clinchant, Crémier and Billot, and junior staff officers such as Major Brugère (afterwards generalissimo of the French army), secured what success was attained.

The Campaign in the East.—Werder, the German commander, warned of the imposing concentration of the French, evacuated Dijon and Dôle just in time to avoid the blow and rapidly drew together his forces behind the Ognon above Vesoul. A furious attack on one of his divisions at Villersexel (Jan. 9) cost him 2,000 prisoners as well as his killed and wounded, and Bourbaki, heading for Belfort, was actually nearer to the fortress than the Germans. But at the crisis more time was wasted, Werder (who had almost lost hope of maintaining himself and had received both encouragement and stringent instructions to do so) slipped in front of the French, and took up a long weak line of defense on the river Lisaine, almost within cannon shot of Belfort. The cumbrous French army moved up and attacked him there with 150,000 against 60,000 (Jan. 15-17, 1871). It was at last repulsed, thanks chiefly to Bourbaki's inability to handle his forces, and, to the bitter disappointment of officers and men alike, he ordered a retreat, leaving Belfort to its fate.

Ere this, so urgent was the necessity of assisting Werder, Manteuffel had been placed at the head of a new Army of the South. Bringing two corps from the I. army opposing Faidherbe and calling up a third from the armies around Paris, and a fourth from the II. army, Manteuffel hurried southward by Langres to the Saône. Then, hearing of Werder's victory on the Lisaine, he deflected the march so as to cut off Bourbaki's retreat, drawing off the left flank guard of the latter (commanded with much *éclat* and little real effect by Garibaldi) by a sharp feint attack on Dijon. The pressure of Werder in front and Manteuffel in flank gradually forced the now thoroughly disheartened French forces towards the Swiss frontier, and Bourbaki, realizing at once the ruin of his army and his own incapacity to re-establish its efficiency, shot himself, though not fatally, on Jan. 26. Clinchant, his successor, acted promptly enough to remove the immediate danger, but on the 29th he was informed of the armistice without at the same time being told that Belfort and the eastern theatre of war had been on Jules Favre's demand expressly excepted from its operation. Jules Favre, it appears, neglected to inform Gambetta of the exception. Thus the French, the leaders distracted by doubts and the worn-out soldiers fully aware that the war was practically over, stood still, while Manteuffel completed his preparations for hemming them in. On Feb. 1 General Clinchant led his troops into Switzerland, where they were disarmed, interned and well cared for by the authorities of the neutral state. The rearguard fought a last action with the advancing Germans before passing the frontier. On the 16th, by order of the French government, Belfort capitulated, but it was not until the 11th of March that the Germans took possession of Bitché, the little fortress on the Vosges, where in the early days of the war de Failly had illustrated so signally the want of concerted action and the neglect of opportunities which had throughout proved the bane of the French armies.

The losses of the Germans during the whole war were 28,000 dead and 101,000 wounded and disabled, those of the French, 156,000 dead (17,000 of whom died of sickness and wounds, as

prisoners in German hands, and 143,000 wounded and disabled. 720,000 men surrendered to the Germans or to the authorities of neutral states, and at the close of the war there were still 250,000 troops on foot, with further resources not immediately available to the number of 280,000 more. In this connection, and as evidence of the respective numerical yields of the German system working normally and of the French improvised for the emergency, we quote from Berndt (*Zahl im Kriege*) the following comparative figures:—

End of July	French 250,000,	Germans 384,000 under arms.
Middle of November	" 500,000,	" 425,000 " "
After the surrender of Paris and the disarmament of Bourbaki's army	" 534,000,	" 835,000 " "

The date of the armistice was Jan. 28, and that of the ratification of the treaty of Frankfurt May 23, 1871.

BIBLIOGRAPHY.—The literature of the war is of immense volume, and the following list only includes a short selection of the most important works.

General.—German official history, *Der deutsch-französische Krieg* (Berlin, 1872–1881; English and French translations); monographs of the German general staff (*Kriegsgesch. Einzelschriften*); Moltke, *Gesch. des deutsch-französischen Krieges* (Berlin, 1891; English translation) and *Gesammelte Schriften des G. F. M. Grafen v. Moltke* (Berlin, 1900–); French official history, *La Guerre de 1870–1871* (Paris, 1902–) (the fullest and most accurate account); P. Lehautcourt (General Palat), *Hist. de la guerre de 1870–1871* (Paris, 1901–1907); v. Verdy du Vernois, *Studien über den Krieg . . . auf Grundlage 1870–1871* (Berlin, 1892–1896); G. Cardinal von Widdern, *Kritische Tage 1870–1871* (French translation, *Journées critiques*). Events preceding the war are dealt with in Bernhardt, *Zwischen zwei Kriegen*; Baron Stoffel, *Rapports militaires 1866–1870* (Paris, 1871; English translation); G. Lehmann, *Die Mobilmachung 1870–1871* (Berlin, 1905).

For the war in Lorraine: Prince Kraft of Hohenlohe-Ingelfingen, *Briefe über Strategie* (English translation, *Letters on Strategy*); F. Foch, *Conduite de la guerre*, pt. ii.; H. Bonnal, *Manoeuvre de Saint Privat* (Paris, 1904–1906); Maistre, *Spicheren* (Paris, 1908); v. Schell, *Die Operationen der I. Armee unter Gen. von Steinmetz* (Berlin, 1872; English translation); F. Hoenig, *Taktik der Zukunft* (English translation), and *24 Stunden Moltke'schen Strategie* (Berlin, 1892; English and French translations).

For the war in Alsace and Champagne: H. Kunz, *Schlacht von Wörth* (Berlin, 1891), and later works by the same author; H. Bonnal, *Fröschweiler* (Paris, 1899); Hahnke, *Die Operationen der III. Armee bis Sedan* (Berlin, 1873; French translation).

For the war in the Provinces: v. der Goltz, *Léon Gambetta und seine Armeen* (Berlin, 1877); *Die Operationen der II. Armee an die Loire* (Berlin, 1875); *Die sieben Tage von Le Mans* (Berlin, 1873); Kunz, *Die Zusammensetzung der französ. Provinzialheeren*; de Freycinet, *La Guerre en province* (Paris, 1871); L. A. Hale, *The People's War* (London, 1904); Hoenig, *Volkskrieg an die Loire* (Berlin, 1892); Blume, *Operationen v. Sedan bis zum Ende d. Krieges* (Berlin, 1872; English translation); v. Schell, *Die Operationen der I. Armee unter Gen. v. Goeben* (Berlin, 1873; English translation); Count Wartensleben, *Feldzug der Nordarmee unter Gen. v. Manteuffel* (Berlin, 1872), *Operationen der Südararmee* (Berlin, 1872; English translation); Faidherbe, *Campagne de l'armée du nord* (Paris, 1872).

For the sieges: Frobenius, *Kriegsgesch. Beispiele d. Festungskrieges aus d. deutsch-franz. Kg.* (Berlin, 1899–1900); Goetze, *Tätigkeit der deutschen Ingenieure* (Berlin, 1871; English translation).

The most useful bibliography is that of General Palat ("P. Lehautcourt"). (C. F. A.)

FRANÇOIS (1717–1769), French etcher and engraver, born at Nancy. He studied art under Claude Charles at Nancy. He experimented on his own in copper engraving, worked at Dijon and Lyons, where he published in 1740 the *Principes de dessein faciles*, with descriptions of a new process imitating the effect of crayon drawings in engraving. He perfected this process in the following years and in 1758 he received a pension of 100 livres from the king with the title "graveur des desseins du Cabinet du Roi." His most important work is the series of portraits for Saverien's *Histoire des Philosophes modernes* (1761–69). François' work is not artistic. Its importance is due to his claim of having introduced the crayon method. He himself stated in a letter addressed to Saverien (1760) that he made experiments in the method in 1740; and the fact that he attained recognition from the French Royal Academy in 1757 seems to substantiate his statement. Two other engravers claimed for themselves the honour of the discovery, Gilles Demarteau and L. M. Bonnet.

FRANÇOIS DE NEUFCHÂTEAU, NICOLAS LOUIS, COUNT (1750–1828), French statesman and poet, was born at Saffais, Lorraine, on April 17, 1750, the son of a school-teacher. He studied at the Jesuit college of Neufchâteau in the Vosges, and at 14 published verses which were praised by Rousseau and Voltaire. Neufchâteau conferred on him its name, and he was elected member of some of the principal academies of France. From 1783 to 1789 he was *procureur-général* to the council of Santo Domingo. After the Revolution he was elected deputy *suppléant* to the National Assembly, organized the Department of the Vosges, and was elected later to the Legislative Assembly, of which he first became secretary and then president. In 1793 he was imprisoned on account of his drama *Pamela ou la vertu récompensée* (Théâtre de la Nation, Aug. 1, 1793), but was set free a few days afterwards at the revolution of the 9th Thermidor. In 1797 he became minister of the interior; he developed inland navigation; inaugurated the museum of the Louvre, and was one of the promoters of the first universal exhibition of industrial products. From 1804 to 1806 he was president of the Senate, and in 1808 he received the dignity of count. Retiring from public life in 1814, he occupied himself chiefly in the study of agriculture, until his death on Jan. 10, 1828.

François de Neufchâteau edited the *Lettres Provinciales* and *Pensées* of Pascal (1822–26) and *Gil Blas* (1820). His principal poetical works are *Poésies diverses* (1765); *Ode sur les parlements* (1771); *Nouveaux Contes moraux* (1781); *Les Vosges* (1796); *Fables et contes* (1814); and *Les Tropes, ou les figures de mots* (1817). He was also the author of a large number of works on agriculture.

Simian, *François de Neufchâteau et les expositions* (1889); J. L. Lhumer, *Un homme politique Corrain, François de Neufchâteau* (1913).

FRANCOLIN, the name for birds of the genus *Francolinus* and allied genera, related to the partridge (*q.v.*). There are upwards of 50 forms, which inhabit Asia and Africa. The type species (*F. francolinus*) is found in Cyprus, Palestine, Asia Minor and thence through Persia and India.

FRANCONIA, one of the stem-duchies of mediaeval Germany. It stretched along the valley of the Main from the Rhine to Bohemia, and was bounded on the north by Saxony and Thuringia, and on the south by Suabia and Bavaria. It also included a district around Mainz, Spires and Worms, on the left bank of the Rhine.

This territory, occupied by the most easterly portion of the Frankish people, formed part of the kingdom of Austrasia. After the treaty of Verdun in 843 it became the centre of the East Frankish or German kingdom, and remained for a time the most important of the duchies which arose on the ruins of the Carolingian empire. Its influence began to decline under the kings of the Saxon house (see GERMANY). It lacked political unity, had no opportunities for extension, and soon became divided into Rhenish Franconia and Eastern Franconia. The most influential family in Rhenish Franconia was that of the Salians, the head of which early in the 10th century was Conrad the Red, duke of Lorraine and son-in-law of Otto the Great. In 1024 his great-grandson Conrad, duke of Franconia, was elected German king as Conrad II. and founded the line of Franconian or Salian emperors. Rhenish Franconia gradually became a land of free towns and lesser nobles, and under the earlier Franconian emperors considerable portions passed to the count palatine of the Rhine, the archbishop of Mainz and the bishops of Worms and Spires, and the name Franconia was confined to the eastern portion of the duchy. Clerical authority was becoming predominant in this region. A series of charters dating from 822 to 1025 had granted considerable powers to the bishops of Würzburg, who, by the time of the emperor Henry II., possessed judicial authority over the whole of Eastern Franconia. The duchy was nominally retained by the emperors in their own hands until 1115, when the emperor Henry V., wishing to curb the episcopal influence in this neighbourhood, appointed his nephew Conrad of Hohenstaufen as duke of Franconia. Conrad's son Frederick took the title of duke of Rothenburg instead of duke of Franconia, but in 1196, on the death of Conrad of Hohenstaufen,

son of the emperor Frederick I., the title fell into disuse. Meanwhile the bishop of Würzburg had regained his formal power in the duchy, and this was confirmed in 1168 by the emperor Frederick I.

The title was assumed by John II., bishop of Würzburg early in the 15th century, and retained by his successors until the bishopric was secularized in 1802. The name Franconia was revived in 1837, when Louis I., king of Bavaria, gave to three northern portions of his kingdom the names of Upper, Middle and Lower Franconia. When Germany was divided into circles by the emperor Maximilian I. in 1500, the name Franconia was given to that circle which included the eastern part of the old duchy. The lands formerly comprised in the duchy of Franconia are now divided among Bavaria, Württemberg, Baden, Hesse and the Prussian province of Hesse-Nassau.

See T. Henner, *Die herzogliche Gewalt der Bischöfe von Würzburg* (Würzburg, 1874); F. Stein, *Geschichte Frankens* (Schweinfurt, 1885-86).

FRANCS-ARCHERS. The institution of the *francs-archers* was the first attempt at the formation of regular infantry in France. They were created by the ordinance of Montils-les-Tours on Aug. 28, 1448, which prescribed that in each parish an archer should be chosen from among the most apt in the use of arms; this archer to be exempt from the *taille* and certain obligations, to practise shooting with the bow on Sundays and feast-days and to hold himself ready to march fully equipped at the first signal. Under Charles VII. the *francs-archers* distinguished themselves in numerous battles with the English. During the succeeding reigns the institution languished and finally disappeared in the middle of the 16th century. The *francs-archers* were also called *francs-taupins*.

See Daniel, *Histoire de la milice française* (1721); and E. Boutaric, *Institutions militaires de la France avant les armées permanentes* (1863).

FRANCS-TIREURS, irregular troops, almost exclusively infantry ("free-shooters"), employed by the French in the war of 1870-71. They were originally rifle clubs or unofficial military societies formed in the east of France at the time of the Luxembourg crisis of 1867. The members were chiefly concerned with the practice of rifle-shooting, and were expected in war to act as light troops. As under the then system of conscription the greater part of the nation's military energy was allowed to run to waste, the *francs-tireurs* were not only popular, but efficient workers in their sphere of action. As they wore no uniforms, were armed with the best rifles and elected their own officers, the Government made repeated attempts to bring the societies, which were at once a valuable asset to the armed strength of France and a possible menace to internal order, under military discipline. This was strenuously resisted by the societies, to their sorrow as it turned out, for the Germans treated captured *francs-tireurs* as irresponsible non-combatants found with arms in their hands and usually exacted the death penalty. In July 1870, at the outbreak of the war, the societies were brought under the control of the minister of war and organized for field service, but it was not until November—by which time the *levée en masse* was in force—that they were placed under the orders of the generals in the field. After that they were sometimes organized in large bodies and incorporated in the mass of the armies, but more usually they continued to work in small bands, blowing up culverts on the invaders' lines of communication, cutting off small reconnoitring parties, surprising small posts, etc. It is now acknowledged, even by the Germans, that though the *francs-tireurs* did relatively little active mischief, they paralyzed large detachments of the enemy, contested every step of his advance (as in the Loire campaign), and prevented him from gaining information. Their most celebrated feats were the blowing up of the Moselle railway bridge at Fontenoy on Jan. 22, 1871 (see *Les Chasseurs des Vosges* by St. Etienne, Toul, 1906), and the heroic defence of Châteaudun by Lipowski's Paris corps and the *francs-tireurs* of Cannes and Nantes (Oct. 18, 1870). Although the original members of the rifle clubs were joined by many bad characters, the patriotism of the majority was unquestionable, for little mercy was shown

by the Germans to those *francs-tireurs* who fell into their hands. The severity of the German reprisals is itself the best testimony to the fear and anxiety inspired by the presence of active bands of *francs-tireurs* on the flanks and in rear of the invaders.

FRANEKER, in the province of Friesland, Holland, 5 m. E. of Harlingen. Pop. (1927) 8,239. It was at one time a favourite residence of the Frisian nobility, and it possessed a celebrated university, founded by the Frisian estates in 1585. This was suppressed by Napoleon I. in 1811, and the endowments diverted to support an atheneum, and afterwards a gymnasium. Franeker also possesses a town hall (1591). The fine observatory was founded about 1780. The church of St. Martin (1420) contains several fine tombs of the 15th-17th centuries. There is a market for agricultural produce.

FRANK, FRANZ HERMANN REINHOLD VON (1827-1894), German Lutheran theologian, was born on March 25, 1827, at Altenburg, and educated at Leipzig university. After teaching at Ratzeburg and Altenburg, in 1857 he was appointed professor of theology at Erlangen, where he died on Feb. 7, 1894.

Frank's chief works are: *System der christlichen Gewissheit* (1870-73; 2nd ed., 1881-83; Eng. trans., 1886), in which he discusses the basis of belief; *System der christlichen Wahrheit* (1878-80; 3rd ed., 1893-94); *System der christlichen Sittlichkeit* (1884-87; Eng. trans., 1886); *Zur Theologie A. Ritschls* (3rd ed., 1891), in which he attacks Ritschls' theology; and *Gesch. und Kritik der neueren Theologie* (1894; 3rd ed., 1898).

See Herzog's *Realencyklopädie*.

FRANK, JAKOB (1726-1791), a Jewish theologian, founded in Poland a sect which emanated from Judaism but ended by merging with Christianity. The sect, the outcome of the Messianic mysticism of Sabbetai Zebi, was an antinomian movement in which the authority of the Jewish law was held to be superseded by personal freedom. It posed as an anti-Talmudic protest in behalf of a spiritual religion. The Frankists in 1759 were baptized *en masse*, amid much pomp, but the Church soon became convinced that Frank was not a genuine convert. He was imprisoned on a charge of heresy, but on his release in 1763 the empress Maria Theresa patronized him, regarding him as a propagandist of Christianity among the Jews. He thenceforth lived in state as baron of Offenbach, and on his death his daughter Eva succeeded him as head of the sect.

FRANK, JOHANN PETER (1745-1821), German physician, was born on March 19, 1745, at Rodalben, Bavaria, and studied at Heidelberg and Strasburg. He became court and garrison physician in Rastadt (1769), professor in Göttingen (1784), in Pavia (1785), director of sanitation in Lombardy (1786), and in 1795 sanitary officer to the Vienna hospitals. In 1804, after a short time in St. Petersburg as ordinary physician and counsellor of State, he returned to practise in Vienna, where he died on April 24, 1821. Frank's fame rests on his *System der medizinischen Policey* (1779), which covers the hygiene of all the stages of a man's life. His treatise on therapeutics, *De Curandis Morbis*, appeared in 1792.

His autobiography was published in Vienna (1802). See also K. Doll, *Dr. J. P. Frank* (Karlsruhe, 1909).

FRANK, LEONHARD (1882-), German writer, was born in Würzburg on Sept. 4, 1882, the son of a carpenter. His early works *Die Räuberbande* (1914) and *Die Ursache* (1915) caused a considerable sensation. The latter which was written in an expressionistic style and revealed the influence of psycho-analytical doctrines, consisted of a bitter attack on tyrannical schoolmasters. In 1917 Frank published *Der Mensch ist gut*, a violently pacifist book most imperfect in form, but of such strong feeling that its revolutionary effect was great. His later works include *Der Bürger* (1924) and *Das Ochsenfüster Männerquartett* (1927), pictures of post-war conditions in Germany. Frank's work is vivid and interesting, but his success was largely due to circumstance. He was elected a member of the German Academy of Letters in 1928.

FRANK-ALMOIGN, in the English law of real property, a species of spiritual tenure, whereby a religious corporation, aggregate or sole, holds lands of the donor to them and their succes-

sors for ever. It was a tenure dating from Saxon times, held not on the ordinary feudal conditions, but discharged of all services except the *trinoda necessitas*. But "they which hold in frank-almoign are bound of right before God to make orisons, prayers, masses and other divine services for the souls of their grantor or feoffor, and for the souls of their heirs which are dead, and for the prosperity and good life and good health of their heirs which are alive. And therefore they shall do no fealty to their lord, because that this divine service is better for them before God than any doing of fealty" (Litt. s. 135). It was the tenure by which the greater number of the monasteries and religious houses held their lands; it was expressly exempted from the statute 12 Car. II. c. 24 (1660), by which the other ancient tenures were abolished, and it is the tenure by which the parochial clergy and many ecclesiastical and eleemosynary foundations hold their lands at the present day. As a form of donation, however, it came to an end by the passing of the statute *Quia Emptores*, for by that statute no new tenure of frank-almoign could be created, except by the Crown.

See Pollock and Maitland, *Hist. of Eng. Law*, vol. i. 218-30.

FRANKEL, ZECHARIAS (1801-1875), Jewish theologian, one of the founders of the Breslau school of "historical Judaism," which attempts to harmonize critical treatment of the documents of religion with fidelity to tradition. For a time at least, the compromise succeeded in staying the disintegrating effects of the liberal movement in Judaism. He became head of the Breslau seminary, founded in 1854 for the training of rabbis who should combine their rabbinic studies with secular courses at the university.

His writings include *Septuagint Studies*, an *Introduction to the Mishnah* (1859), and a similar work on the Palestinian Talmud (1870).

FRANKENBERG, a manufacturing town of Germany, in the republic of Saxony, on the Zschopau, 7 m. N.E. of Chemnitz. Pop. (1925) 13,646. Its industries include extensive woollen, calico-printing, cotton and silk weaving, dyeing, the manufacture of brushes, furniture and cigars, iron-founding and machine building. It has a school of weaving.

FRANKENHAUSEN, a town of Germany, in Thuringia, on an artificial arm of the Wipper, a tributary of the Saale, 36 m. N.N.E. of Gotha. Pop. (1925) 7,641. It consists of an old and a new town, the latter mostly rebuilt since a destructive fire in 1833, and has an old château of the princes of Schwarzburg. Its industries include the manufacture of organs, cigars and buttons, and there are brine springs, with baths, in the vicinity.

FRANKENIAECAE, in botany, the sea-heath family, comprising four genera and 60 species of salt-loving herbs, with jointed stems. There is one British species, *Frankenia laevis*, the sea-heath; and in North America, there are three species, *F. Jamesii*, found from Colorado to Texas; and *F. grandifolia*, the alkali-heath, and *F. Palmeri*, the *yerba reuma* of the Spanish Californians, both native to California.

FRANKENSTEIN, a town of Germany, in the Prussian province of Silesia, on the Pausebach, 35 m. S. by W. of Breslau. Pop. (1925) 10,106. It is still surrounded by its mediaeval walls, has a parish church with a curious overhanging tower, and a monastery. The industries include the manufacture of soap and straw hats. There are also mills for grinding the magnesite found in the neighbourhood; and it is engaged in the grain trade.

FRANKENTHAL, a town of Germany, in the Bavarian Palatinate, on the Isenach, connected with the Rhine by a canal 3 m. in length, 6 m. N.W. from Mannheim. Pop. (1925) 24,647. Frankenthal (Franconodal) is mentioned as a village in the 8th century. A house of Augustinian canons established here in 1119 was suppressed in 1562 by the elector palatine, who gave its possessions to Protestant refugees from the Netherlands. In 1577 this colony received town rights from the elector John Casimir, whose successor fortified the place, and under the elector Charles Theodore it became the capital of the Palatinate. It has a fine mediaeval town-hall, two interesting old gates and remains of its former environing walls. Its industries include the manufacture of machinery, casks, corks, soap, dolls and furniture, sugar-refining, iron-founding and bell-founding—the famous "Kaiserglocke" of the Cologne cathedral was cast here. Franken-

thal was formerly famous for its porcelain factory, making figures and groups, established here in 1755. In 1795 the factory was removed to Grünstadt.

FRANKENWALD, a mountainous district of southern Germany, connecting geologically the Fichtelgebirge and the Thuringian Forest. It is a broad well-wooded plateau, about 30 m. long descending gently on the north and east sides towards the Saale, but more precipitously to the Bavarian plain in the west. Its highest point is the Kieferle near Steinheid (2,900 ft.). Along the centre lies the watershed between the basins of the Main and the Saale, of the Rhine and Elbe systems, respectively. The principal tributaries of the Main from the Frankensteinwald are the Rodach and Hasslach; of the Saale, the Selbitz.

FRANKFORT, a city of Indiana, U.S.A., 40m. N.W. of Indianapolis; the county seat of Clinton county. It is served by the Chicago, Indianapolis and Louisville, the Nickel Plate and the Pennsylvania railways and by two inter-urban trolley lines. The population was 11,585 in 1920 (98% native white) and was 12,196 in 1930 by the Federal census. It is the trade centre for a fertile farming region with products valued at \$7,000,000 annually, and in 1927 the output of the city's 26 factories was valued at \$6,147,461. The largest industry is the railroad shops of the Clover Leaf division of the Nickel Plate road, employing 1,000 persons. Others of importance are manufactures of kitchen cabinets, "porceliron" table-tops, plumbers' brass goods, cigars, butter, meat products, flour and children's play garments. The city owns its electric light and power plant, and hydro-electric power is available from the development on the Tippecanoe river. The first settlement in this vicinity was made in 1826. In 1830 the town was founded, and in 1875 it was incorporated as a city.

FRANKFORT, the capital city of Kentucky, U.S.A., and the county seat of Franklin county; on the Kentucky river, 52m. E. of Louisville. It is on Federal highway 60, and is served by the Chesapeake and Ohio, the Frankfort and Cincinnati and the Louisville and Nashville railways. The population was 9,805 in 1920 (23% negroes) and was 11,626 in 1930 by the Federal census. It is in the heart of the "blue grass" region, and surrounded by picturesque hills on both sides of the river. The State capitol (built in 1905-07 at a cost of \$2,000,000) is of granite and white limestone, 400ft. long by 185ft. wide, finished on the interior entirely in white marble. The old capitol (1829) is occupied by the State historical society. The State arsenal, the State institution for feeble-minded children and the State industrial college (for negroes) are situated here. The city is a trading centre for the rich surrounding country, which produces hemp and tobacco and raises thorough-bred trotting horses. The manufactures include twine, lumber, furniture, brooms and shoes. Frankfort was founded in 1786 by Gen. James Wilkinson, became the capital of the State in 1792 (when its population was less than 500) and was chartered as a city in 1839. During the Civil War it was occupied for a short time (in 1862) by Gen. Braxton Bragg (Confederate), who was driven out by Gen. D. C. Buell. In 1900 there was a bitter contest for the governorship, in connection with which the Democratic claimant, William Goebel, was assassinated. Daniel Boone and other national heroes are buried in Frankfort Cemetery.

FRANKFURT-ON-MAIN, a city in the Prussian province of Hesse-Nassau, principally on the right bank of the Main, 24 m. above its confluence with the Rhine at Mainz. Always a place of great trading importance, long the place of election for the German kings, and until 1866, together with Hamburg, Bremen and Lübeck, one of the four free cities of Germany, it is one of the leading commercial centres of Germany. The various stages in the development of the city are clearly indicated in its general plan and the surviving names of many of its streets. The line of the original 12th century walls and moat is marked by street names ending in *-graben*, from the Hirschgraben on the west to the Wollgraben on the east. These and the river on the south enclose the "old town" (*Altstadt*). The "new town" (*Neustadt*), added in 1333, extends to the *Anlagen*, the gardens and promenades laid out (1806-1812) on the site of the 17th century fortifications, of which they preserve the general ground plan. Of

the mediaeval fortifications the Eschenheimer Tor, a round tower 155 ft. high, dating from 1400 to 1428, the Rententurm (1456) on the Main and the Kuhlrenturm (c. 1490) in Sachsenhausen, are the sole remains. Its boundaries have been extended in all directions and include Sachsenhausen, where stand the Church and House of the Teutonic Order, Bornheim, and the former Hessian town of Bockenheim.

The main development has been to the north of the river. The Altstadt still preserves many of its mediaeval features. The Judengasse (Ghetto), down to 1806 the sole Jews' quarter, has been pulled down, with the exception of the ancestral house of the Rothschild family. As the Altstadt is mainly occupied by artisans and petty tradesmen, so the Neustadt is the principal business quarter of the city, containing the chief public buildings and the principal hotels.

Churches.—The cathedral (Dom) built of red sandstone, has a massive tower 300 ft. in height. This building, in which the Roman emperors were formerly elected and, since 1562, crowned, was founded in 852 by King Louis the German, and was later known as the Salvatorkirche. After its reconstruction (1235–1239), it was dedicated to St. Bartholomew. Nave and side aisles are of 1235–39 choir 1315–38, long transepts 1346–54, cloisters rebuilt 1348–1447, electoral chapel south of the choir 1355, tower (unfinished) 1415. In 1867 the tower and roof were destroyed by fire and considerable other damage was done. The restoration was finished in 1881, including the completion of the tower, according to the original plans. The Leonhardskirche (restored in 1882) was begun in 1219, it is said on the site of the palace of Charlemagne. It was originally a three-aisled basilica, but is now a five-aisled *Hallenkirche*; the choir was added in 1314. It has two Romanesque towers. The Liebfrauenkirche is first mentioned in 1314 as a collegiate church; the nave was consecrated in 1340. The choir was added in 1506–1509 and the whole church restored in the second half of the 18th century, when the tower was built (1770). Of the Protestant churches, the Nikolaikirche dates from the 13th century. The Katharinenkirche, built 1678–1681 on the site of an older building, is famous in Frankfurt history as the place where the first Protestant sermon was preached in 1522.

Public Buildings.—The Römer, for almost five hundred years the Rathaus (town hall), lies on the Römerberg, a square flanked by mediaeval houses. It is first mentioned in 1322, was bought with the adjacent hostelry in 1405 by the city and rearranged as a town hall, and has since, from time to time, been enlarged by the purchase of adjoining patrician houses, forming a complex of buildings of various styles and dates surmounted by a clock tower. The façade was rebuilt (1896–1898) in late Gothic style. Here, in the Wahlzimmer (or election-chamber) the electors or their plenipotentiaries chose the German kings. New municipal buildings adjoining the "Römer" on the north side were erected in 1900–1903. The palace of the princes of Thurn and Taxis in the Eschenheimer Gasse was built 1732–1741. From 1816 to 1866 it was the seat of the German federal diet. It is now annexed to the principal post office (built 1892–1894), which lies close to it on the Zeil. The Saalhof, built on the site of the palace erected by Louis the Pious in 822, overlooking the Main, has a chapel of the 12th century, the substructure dating from Carolingian times. The Leinwandhaus (linendrapers' hall), a 15th century building was reconstructed in 1892 as a municipal museum. In the Grosser Hirschgraben is the Goethehaus, a 16th century building in which Goethe lived from his birth in 1749 until 1775. In 1863 the house was acquired by the *Freies deutsche Hochstift* and was opened to the public, and is now connected with a Goethe-museum (1897), with archives and a library representative of the Goethe period of German literature.

Literary and Scientific Institutions.—The opera house is a magnificent edifice in the style of the Italian Renaissance. The public picture gallery in the Saalhof possesses works by Hans Holbein, Grünewald, Van Dyck, Teniers, Van der Neer, Hans von Kulmbach, Lucas Cranach and other masters. The Städel Art Institute (Städel'sches Kunstinstitut) in Sachsenhausen, contains a picture gallery and a rich collection of German engravings. The municipal library has a Gutenberg Bible printed at Mainz

between 1450 and 1455, another on parchment dated 1462, the *Institutiones Justiniani* (Mainz, 1468), the *Theuerdank*, with woodcuts by Hans Schöufelein, and numerous valuable autographs. It also contains a fine collection of coins. The *Senckenberg'sches naturhistorisches Museum* contains valuable collections of birds and shells. The Royal Institute for experimental therapeutics (*Königl. Institut für experimentelle Therapie*) moved to Frankfurt in 1899, is especially concerned with the study of bacteriology and serums. In 1914 a university was founded, and in connection with it is an academy of labour.
